\textbf{Abstract}

We establish the mathematical validity of the Prandtl boundary-layer theory for a family of (nonlinear) parallel pipe flow. The convergence is verified under various Sobolev norms, including the physically important space–time uniform norm, as well as the $L^\infty(H^1)$ norm. Higher-order asymptotics is also studied.

\section{1. Introduction}

Boundary layers associated with slightly viscous incompressible fluid flow equipped with the physical \textbf{no-slip no-penetration} boundary condition are of great importance. From the physical point of view, in the absence of body force, it is the vorticity generated by the boundary layer and later advected into the main stream that drive the flow (see for instance the classical treatise by Schlichting [1] and the references therein). Indeed, many physical phenomena cannot be explained in a satisfactory fashion without accounting for boundary-layer effects (D'Alembert's paradox is one). From the mathematical point of view, the boundary-layer problem is a serious challenge since the slightly viscous fluid equation, the Navier–Stokes system at small viscosity, can be viewed as a singular...
perturbation of the Euler system that governs the flow of inviscid fluids (see for instance the book by Oleinik and Samokhin [2] and the review paper by E [3]).

Moreover, the leading-order singular behavior governed by the so-called Prandtl equation [4,2] may be ill-posed (see the recent work by Guo and Nguyen [5], Gérard-Varet and Dormy [6], Grenier [7], and E and Engquist [8]). Even if the Prandtl boundary-layer system is well-posed, one still needs to verify a spectral constraint on the Prandtl solution to ensure the convergence as was pointed out in [9]. The verification of such kind of spectral constraint may not be straightforward and it is still unknown if the classical Oleinik profile (as presented in her classical treatise [2], see also Xin and Zhang [10]) that leads to a well-posed Prandtl system satisfies the spectral constraint.

The well-posedness of the Prandtl system is already a challenge (see the works cited above). Our knowledge on the validity on the Prandtl boundary-layer theory under Dirichlet boundary condition is extremely limited and the validity itself remains a major conundrum. In fact, the validity of the Prandtl theory is listed as one of the 8 main open problems in mathematical theories for boundary layer in the book by Oleinik and Samokhin [2]. Besides various cases where the Navier–Stokes system reduces to the trivial linear heat equation (either in half-space, or in a channel, or in a disk), the only known results on the validity of Prandtl theory are either for analytical data in half-space due to Caflisch and Sammartino [11], or channel flow with uniform injection and suction at the boundary by Temam and Wang [12,13], or a special class of plane-parallel flow introduced in [14] with the boundary-layer behavior carefully investigated by Mazzucato, Niu and Wang [15]. Therefore, it is worthwhile to identify special type of flows for which the Prandtl theory may be rigorously validated.

In this work, we investigate the validity of Prandtl boundary-layer theory associated with a special type of parallel pipe flow introduced in [14]. In this case we assume that the fluids occupy an infinitely long pipe with circular cross-section of radius 1, and with the x-axis being the axis of the pipe. We impose that the flow is parallel to the axis of the pipe all the time (therefore no component of the velocity in the radial direction), and the flow is periodic in $x$ with period $L$ for simplicity. The classical Poiseuille flow is a special case of our ansatz provided we identify the mean pressure gradient as part of the (periodic in $x$) body force. Hence the spatial domain is $Q = \Omega \times [0, L]$, where $\Omega = \{(r, \phi) \mid 0 \leq r \leq 1, \phi \in [0, 2\pi]\}$ is the unit disk and $L$ is the horizontal period in the cylindrical coordinates with $\phi$ being the azimuthal angle and $r$ being the distance to the axis of the pipe (see Fig. 1).

Throughout the paper, we will denote the solution of the Navier–Stokes system with viscosity coefficient $\nu$ by $u^{\nu}$, satisfying the following system of equations:

\begin{align*}
\partial_t u^{\nu} + (u^{\nu} \cdot \nabla) u^{\nu} + \nabla p^{\nu} &= \nu \Delta u^{\nu} + f, \quad x \in Q, \quad T > 0, \\
u u^{\nu} \big|_{t=0}(x) &= u_0(x), \quad x \in Q, \quad (1.2) \\
 u^{\nu}(t) &= \beta(t), \quad \text{on } \partial Q, \quad (1.3)
\end{align*}

where $\Delta$ is the (scalar) Laplace operator, $u^{\nu}$ is the fluid velocity, $p^{\nu}$ is the fluid pressure, $f$ are external body forces, and $\beta$ is the azimuthal velocity at the boundary. The solution of the Euler system will be denoted by $u^0$, satisfying the system:

\begin{align*}
\partial_t u^0 + (u^0 \cdot \nabla) u^0 + \nabla p^0 &= 0, \quad x \in Q, \quad T > 0, \\
 u^0(x, 0) &= u_0(x), \quad x \in Q, \quad (1.5) \\
 u^0 \cdot n &= 0, \quad \text{on } \partial Q, \quad (1.6)
\end{align*}
where \( \mathbf{n} \) is the unit outer normal to \( \partial Q \). For simplicity, we take the same initial condition for both \( \mathbf{u}^v \) and \( \mathbf{u}^0 \), which we have denoted by \( \mathbf{u}_0 \). This choice can be relaxed.

The special type of parallel pipe flow that we investigate in this manuscript satisfies the following ansatz for the Navier–Stokes solution:

\[
\mathbf{u}^v = u_{\phi}^v(t, r) \mathbf{e}_\phi + u_x^v(t, r, \phi) \mathbf{e}_x, \quad p^v = p^v(t, r),
\]

(1.7)

where \( \mathbf{u}^v \) and \( p^v \) are the velocity and pressure field respectively, and \( \mathbf{e}_\phi, \mathbf{e}_x, \mathbf{e}_r \) are the unit vector in the azimuthal direction, \( x \) direction, and radial direction respectively.

Observe that such flow satisfying the incompressibility condition automatically, and the Navier–Stokes system (1.1) with viscosity \( \nu \), external body force \( \mathbf{f} \) and the boundary shear velocity \( \beta \) reduces to the following weakly nonlinear system under the ansatz (1.7)

\[
-(u_{\phi}^v)^2 + r \partial_r p^v = 0, \\
\partial_t u_{\phi}^v = \frac{\nu}{r} \partial_r (r \partial_r u_{\phi}^v) - \frac{\nu}{r^2} u_{\phi}^v + f_1(t, r), \\
\partial_t u_x^v + \frac{u_{\phi}^v}{r} \partial_\phi u_x^v = \frac{\nu}{r} \partial_r (r \partial_r u_x^v) - \frac{\nu}{r^2} \partial_\phi u_x^v + f_2(t, r, \phi),
\]

(1.8)

with the following boundary and initial data

\[
\mathbf{u}^v \bigg|_{r=1} = \beta := \beta_{\phi}(t) \mathbf{e}_\phi + \beta_x(t, \phi) \mathbf{e}_x, \\
\mathbf{u}^v 	ext{ is periodic in } x \text{ direction,} \\
\mathbf{u}^v \bigg|_{t=0} = \mathbf{u}_0 := a(r) \mathbf{e}_\phi + b(r, \phi) \mathbf{e}_x.
\]

(1.9)

It is remarkable that the pressure term \( p^v \) can be uniquely (up to a constant) recovered from the first equation in system (1.8). Therefore the second equation and third equation of (1.8) form a closed weakly coupled parabolic system, written in Cartesian coordinates as the following:

\[
\partial_t \mathbf{u}^v - \nu \Delta_v \mathbf{u}^v = \mathbf{F}_1, \\
\partial_t u_x^v + (\mathbf{u}^v \cdot \nabla_v) u_x^v - \nu \Delta_v u_x^v = F_2,
\]

(1.10)

with the same boundary and initial conditions as (1.9). It follows in particular that the ansatz (1.7) is preserved by the evolution of the flow.

Here \( \mathbf{u}^v = (-u_\phi \sin \phi, u_\phi \cos \phi) \), \( \mathbf{F}_1 = (-f_1(t, r) \sin \phi, f_1(t, r) \cos \phi) \), \( \mathbf{u}^v = (u_{\phi}^v, u_x^v) \), \( F_2 = f_2(t, r, \phi) \), \( \Delta_v = \partial_{x_1 x_1} + \partial_{x_2 x_2} \), \( \nabla_v = (\partial_{x_1}, \partial_{x_2}) \).

Similar to the ansatz (1.7), we also assume

\[
\mathbf{u}^0 = u_{\phi}^0(t, r) \mathbf{e}_\phi + u_x^0(t, r, \phi) \mathbf{e}_x, \quad p^0 = p^0(t, r).
\]

(1.11)

Then the Euler system (1.4) reduces to the following system:

\[
-(u_{\phi}^0)^2 + r \partial_r p^0 = 0, \\
\partial_t u_{\phi}^0 = f_1, \\
\partial_t u_x^0 + \frac{u_{\phi}^0}{r} \partial_\phi u_x^0 = f_2.
\]

(1.12)
with initial condition
\[ u^0 \big|_{t=0} = a(r)e_\phi + b(r, \phi)e_x. \]  

We observe that the no-penetration condition at the walls for the Euler solution is automatically satisfied in this case.

Due to the disparity of boundary conditions between the reduced Navier-Stokes system (1.8) and the reduced Euler system (1.12), a boundary layer must exist outside of which the flow is expected to be well approximated by the Euler solution \( u^0 \). Inside the layer, a flow corrector is needed, which approximates \( u^v - u^0 \). At leading order, the corrector \( \theta^0 \) is formally governed by the Prandtl-type equation (2.4) (see the next section for a formal derivation). The goal of this manuscript is to investigate the mathematical validity of the Prandtl-type approximation for this special type of flow in a pipe. More precisely, we investigate whether \( u^v - u^0 - \theta^0 \) converges to zero in various norms. Our main result is the rigorous verification of the Prandtl theory in the sense of the following theorem.

**Theorem 1.** Under appropriate smoothness and compatibility assumptions on the initial and boundary data, we have, for some constant \( c \) independent of the viscosity \( \nu \),

\[
\| u^v - u^0 - \theta^0 \|_{L^{\infty}(0,T;L^2(\Omega))} \leq c \nu^{\frac{3}{2}}, 
\]

\[
\| u^v - u^0 - \theta^0 \|_{L^{\infty}(0,T;H^1(\Omega))} \leq c \nu^{\frac{1}{2}}, 
\]

\[
\| u^v - u^0 - \theta^0 \|_{L^{\infty}(\Omega \times [0,T])} \leq c \nu^{\frac{1}{2}}, 
\]

\[
\| p^v - p^0 \|_{L^{\infty}(\Omega \times [0,T])} \leq c \nu^{\frac{1}{2}}, 
\]

\[
\| p^v - p^0 \|_{L^{\infty}(0,T;H^1(\Omega))} \leq c \nu^{\frac{1}{4}}. 
\]

Flows with the special symmetry (1.7) were first investigated in [14], where the convergence in the \( L^{\infty}(L^2) \) norm of the viscous solution \( u^v \) to the inviscid solution \( u^0 \) as \( \nu \to 0 \) was established via a Kato-Hopf-type approach without referring to the Prandtl theory. The simpler case of planar flows was analyzed in detail in [16,17]. Mazzucato and Taylor [18] have recently carried out an analysis of the boundary layer using semiclassical techniques and layer potentials. This approach does not rely on the Prandtl theory as well and does not require any type of compatibility conditions between the initial and boundary data. However, it yields only convergence in \( L^{\infty}(L^p) \) with \( p \in [1, +\infty] \) and does not provide any estimate on normal gradients at the boundary. Convergence in \( L^{\infty}(L^2) \) and \( L^2(H^1) \) norm was formally derived and announced in [9].

We believe that the result presented here is the first rigorous result on the validity of the Prandtl boundary-layer theory for the Navier-Stokes system in a nonlinear setting in a domain with curved boundaries. The curvature effect can be discerned from the pressure estimates which is different from the flat boundary case (see for instance [19,15]). Another important difference with respect to the flat case is the need here to impose first-order compatibility conditions in order to derive uniform in time bounds on the \( H^1 \) norm of the error. Only zero-order compatibility among the data should be needed for zero-order correctors. We plan to explore this point further in future work.

The curved boundary also motivated us to further develop certain classical anisotropic estimates and embeddings. (See Temam and Wang [13,20] for this idea applied to boundary layer associated with the linear and nonlinear Navier-Stokes equations with Dirichlet boundary conditions with flat boundary.) In particular, a novel coupled boundary layer and interior domain approach is developed in order to derive the \( L^{\infty}(H^1) \) estimate in our curved geometry. This approach allows us to easily handle the singularity at \( r = 0 \) in (1.8). At the same time, it is not convenient to work in Cartesian coordinates near the boundary, as highlighted for instance by the particular simple form that the compatibility conditions between the initial data and the boundary data take in cylindrical coordinates.
(see Eq. (B.4) and the discussion in Appendix B). The derivation of decay rates for the correctors is also more amenable in cylindrical coordinates.

We would like to point out that the validity of the Prandtl theory presented here is strictly under the assumption of the parallel pipe flow symmetry (1.7). It is likely that flows with symmetry (1.7) are unstable under generic three-dimensional perturbation. Therefore, it is quite possible that the Prandtl theory is invalid in the more general setting.

We also remark that there exist abundant literature on boundary-layer analysis as well as the related vanishing viscosity limit problem associated with the Navier–Stokes system equipped with different (non-Dirichlet) boundary conditions. For instance, for the case of Navier-slip (and the simpler free-slip) boundary condition, there are many interesting works on the related vanishing viscosity limit as well as the analysis of the (secondly) boundary layer. (See for example [21–34] among many others.) However it is beyond the scope of this paper to survey results associated with various kinds of boundary conditions (non-no-slip no-penetration).

The rest of the paper is organized as follows. We provide a formal derivation of the Prandtl-type equation for the leading-order corrector \( \theta^0 \) utilizing the Prandtl-type ansatz in Section 2. The well-posedness of the Prandtl-type boundary-layer system as well as appropriate decay properties is briefly discussed in Appendix A. An approximate solution to the reduced Navier–Stokes system (1.8) is constructed in the second part of Section 2 utilizing the inviscid solution \( u^0 \) and the leading-order boundary-layer-type corrector \( \theta^0 \). The validity of the approximation proposed in Section 2 is rigorously established in Section 3 under various norms. Higher-order asymptotic expansions are considered in Section 4. The regularity of solutions to Euler equations as well as the compatibility conditions needed to ensure the smoothness of the Navier–Stokes system are mentioned in Appendix B.

2. Prandtl-type equation and approximate solution

2.1. Prandtl-type equation for the corrector

According to the Prandtl boundary-layer theory as proposed in [4], the viscous solution and the inviscid solution are close to each other outside a boundary layer of thickness proportional to \( \sqrt{\nu} \).

Moreover, the viscous solution must make a sharp transition to the inviscid main flow at the boundary within the boundary layer because of the no-slip boundary no-penetration condition of the viscous flow. Therefore, we postulate that the solution to the Navier–Stokes system can be approximated by

\[
\begin{align*}
    u^v(t, r, \phi) &\approx u^0(t, r, \phi) + \theta^0(t, \frac{1-r}{\sqrt{\nu}}, \phi), \\
p^v(t, r, \phi) &\approx p^0(t, r) + q^0(t, \frac{1-r}{\sqrt{\nu}}),
\end{align*}
\]

(2.1)

where \( u^0(t, r, \phi) = u^0(t, r)e_\phi + u^0(t, r, \phi)e_x \) is the inviscid solution to the Euler system, and the (boundary-layer-type) corrector \( \theta^0(t, \frac{1-r}{\sqrt{\nu}}, \phi) = \theta^0_\phi(t, \frac{1-r}{\sqrt{\nu}})e_\phi + \theta^0_x(t, \frac{1-r}{\sqrt{\nu}}, \phi)e_x \), thanks to our flow ansatz (1.7).

Introducing the stretched variable \( Z = \frac{1-r}{\sqrt{\nu}} \), we notice that the corrector must satisfy the following matching conditions

\[
\theta^0 \rightarrow 0 \quad \text{as} \quad Z \rightarrow \infty, \quad \theta^0(t, \cdot, \phi)|_{Z=0} = \beta(t, \phi) - u^0(t, 1, \phi).
\]

(2.3)

It is then convenient to work with the following domain for the corrector \( \theta^0 \):

\[\Omega^\infty := [0, 2\pi] \times [0, \infty).\]
Introducing (2.1) and (2.2) into (1.8) and (1.9), utilizing the Euler equation (1.12) and keeping the leading-order terms in \( \nu \), we deduce the following **Prandtl-type equation** for the leading order of the boundary-layer profile (corrector) \( \theta^0 \):

\[
\begin{align*}
\partial_t \theta^0_\phi - \partial_{ZZ} \theta^0_\phi &= 0, \\
\partial_t \theta^0_x + \theta^0_\phi \partial_\phi u^0_x(t, 1, \phi) + \theta^0_x \partial_\phi \theta^0_\phi + u^0_\phi(t, 1) \partial_\phi \theta^0_x &= \partial_{ZZ} \theta^0_x,
\end{align*}
\]

(2.4)

The well-posedness of the system is trivial. The decay, as \( Z \to \infty \), of the solution can be derived in a straightforward manner just as in the case of the linearized compressible Navier–Stokes system studied by Xin and Yanagisawa [33], assuming appropriate compatibility conditions between the initial and boundary data. These are discussed in Appendix B. Decay estimates as well as the main idea of the proof are presented in Appendix A.

It is also easy to realize that the leading-order correction \( q^0 \) to the pressure term satisfies

\[
\partial_Z q^0 = 0,
\]

(2.5)

and hence we can conveniently set

\[
q^0 = 0.
\]

(2.6)

2.2. Approximate solution

With the leading-order corrector \( \theta^0 \) and the inviscid solution \( u^0 \) in hand, we are now in a position to construct an approximate solution to the Navier–Stokes system (1.8) with the given ansatz (1.7).

As in Temam and Wang [13,20] and Mazzucato, Niu and Wang [15], we introduce a cut-off function to ensure that the approximate Navier–Stokes solution \( \tilde{u}^{app} \), given below, satisfies the same boundary conditions as the true Navier–Stokes solution \( u^\nu \). Let \( \rho(r) \) be a smooth function defined on \([0, 1]\) such that

\[
\rho(r) = \begin{cases} 
1, & r \in \left[ \frac{1}{2}, 1 \right], \\
0, & r \in \left[ 0, \frac{1}{4} \right].
\end{cases}
\]

(2.7)

Because of (1.7), the **approximate solution to the Navier–Stokes equation** must have the form:

\[
\tilde{u}^{app} = \tilde{u}^{app}_\phi(t, r) e_\phi + \tilde{u}^{app}_x(t, r, \phi) e_x,
\]

(2.8)

\[
\begin{align*}
\tilde{u}^{app}_\phi(t, r) &= u^0_\phi(t, r) + \rho(r) \theta^0_\phi(t, \frac{1 - r}{\sqrt{\nu}}), \\
\tilde{u}^{app}_x(t, r, \phi) &= u^0_x(t, r, \phi) + \rho(r) \theta^0_x(t, \frac{1 - r}{\sqrt{\nu}}, \phi).
\end{align*}
\]

(2.8a)

In view of (2.6), we take the pressure associated with the approximate velocity to be:

\[
p^{app} = p^0.
\]

(2.9)
It is straightforward to verify that the approximate solution $\tilde{u}^{\text{app}}$ constructed above satisfies the Navier–Stokes system with (small) extra body force:

$$\left(-\left(\tilde{u}^{\text{app}}\right)^2 + r \partial_r p^{\text{app}}\right) = A,$$

$$\partial_t \tilde{u}_\phi^{\text{app}} - \frac{\nu}{r} \partial_r \left(r \partial_r \tilde{u}_\phi^{\text{app}}\right) + \frac{\nu}{r^2} \tilde{u}_\phi^{\text{app}} = B + C + f_1,$$

$$\partial_t \tilde{u}_x^{\text{app}} + \frac{\tilde{u}_x^{\text{app}}}{r} \partial_\phi \tilde{u}_x^{\text{app}} - \frac{\nu}{r} \partial_r \left(r \partial_r \tilde{u}_x^{\text{app}}\right) - \frac{\nu}{r^2} \partial_\phi \partial_\phi \tilde{u}_x^{\text{app}} = D + E + F + f_2,$$  

(2.10)

where the (small) extra body forces are given by

$$A = -\left(\rho \theta_\phi^{0}\right)^2 - 2\rho \theta_\phi^{0} \theta_\phi^{0},$$

$$B = \nu \left[-\frac{1}{r} \partial_r \left(r \partial_r \theta_\phi^{0}\right) + \frac{1}{r^2} \theta_\phi^{0} - \frac{1}{r} \rho' (r) \theta_\phi^{0} + \frac{1}{r^2} \rho \theta_\phi^{0} - \rho'' (r) \theta_\phi^{0}\right],$$

$$C = \sqrt{\nu} \left[\frac{1}{r} \rho \partial_z \theta_\phi^{0} + 2\rho' (r) \partial_z \theta_\phi^{0}\right].$$

$$D = \rho \left(\rho \frac{r}{r} - 1\right) \theta_\phi^{0} \theta_\phi^{0} \theta_x^{0} + \left(\frac{u_\phi^0(t, r)}{r} - u_\phi^0(t, 1)\right) \rho \partial_\phi \theta_x^{0} + \left(\frac{1}{r} \partial_\phi u_x^0(t, r, \phi) - \partial_\phi u_x^0(t, 1, \phi)\right) \rho \theta_\phi^{0},$$

$$E = -\nu \left[-\frac{1}{r} \partial_r \left(r \partial_r u_x^{0}\right) + \frac{1}{r} \rho' (r) \theta_x^{0} + \rho'' (r) \theta_x^{0} + \frac{1}{r^2} \partial_\phi \partial_\phi u_x^{0} + \frac{1}{r^2} \rho \partial_\phi \theta_x^{0}\right],$$

$$F = \sqrt{\nu} \left[2\rho' (r) \partial_z \theta_x^{0} + \frac{1}{r} \rho \partial_z \theta_x^{0}\right].$$  

(2.11)

This approximate solution satisfies the desired boundary and initial conditions in the sense that

$$\tilde{u}^{\text{app}} |_{r=1} = \beta_\phi(t) e_\phi + \beta_x(t, \phi) e_x,$$

$$\tilde{u}^{\text{app}} |_{t=0} = \alpha(r) e_\phi + b(r, \phi) e_x.$$  

(2.12)

3. Error estimates and convergence rates

We are now ready to prove our main result, that is, estimates on the error $u^v - \tilde{u}^{\text{app}}$. We observe that the convergence of $\tilde{u}^{\text{app}}$ to $u^v$ also implies the convergence of $u^v - u^0 - \theta^0$ to zero due to the choice of the cut-off function $\rho$ in (2.7) and the decay property of the boundary-layer function $\theta^0$.

For the purpose of convergence analysis, we introduce the error solution $u^{err} = u^v - \tilde{u}^{\text{app}}$, with associated pressure $p^{err} = p^v - p^{\text{app}}$. (We recall that, due to the symmetry of the flow, the pressure appears only in the equations for the cross-sectional components of the velocity, which are linear.) The error solution satisfies the following system of equations:

$$\left(u^{err}_\phi \right)^2 + 2u^{err}_\phi u^{\text{app}} \theta_\phi^{0} - r \partial_t p^{err} = A,$$  

(3.1a)

$$\partial_t u^{err}_\phi - \frac{\nu}{r} \partial_r \left(r \partial_r u^{err}_\phi\right) + \frac{\nu}{r^2} u^{err}_\phi = -B - C,$$  

(3.1b)

$$\partial_t u^{err}_x + \frac{u^{err}_x}{r} \partial_\phi u^{err}_x + \frac{u^{\text{app}}_x}{r} \partial_\phi u^{\text{app}}_x - \frac{\nu}{r} \partial_r \left(r \partial_r u^{err}_x\right) - \frac{\nu}{r^2} \partial_\phi \partial_\phi u^{err}_x = -D - E - F.$$  

(3.1c)
where the body forcing terms \( A \) through \( F \) are given in (2.11), and the boundary conditions and initial data are specified as:

\[
\begin{align*}
\langle u^\text{err} \rangle_{\Gamma^1} &= 0, \\
\langle u^\text{err} \rangle_{\Gamma^0} &= 0.
\end{align*}
\]

(3.2)

Our goal in this section is to show that \( u^\text{err}, p^\text{err} \) converge to zero in different norms as \( \nu \) tends to zero. More precisely, we aim at proving the following result.

**Theorem 2.** Suppose the initial data \( u_0 \), the boundary data \( \beta \), and the external forces \( F \) are given as in Proposition 11. Then there exist positive constants \( c \) independent of \( \nu \), such that for any solution \( u^\nu \) of the system (1.8)–(1.9),

\[
\begin{align*}
\| u^\nu - \tilde{u}^\text{app} \|_{L^\infty(0,T;L^2(\Omega))} &\leq c \nu^{\frac{3}{4}}, \\
\| u^\nu - \tilde{u}^\text{app} \|_{L^2(0,T;H^1(\Omega))} &\leq c \nu^{\frac{1}{4}}, \\
\| u^\nu - \tilde{u}^\text{app} \|_{L^\infty(0,T;H^1(\Omega))} &\leq c \nu^{\frac{1}{4}}, \\
\| p^\nu - p^0 \|_{L^\infty(\Omega \times [0,T])} &\leq c \nu^{\frac{1}{2}}, \\
\| p^\nu - p^0 \|_{L^\infty(0,T;H^1(\Omega))} &\leq c \nu^{\frac{1}{4}}.
\end{align*}
\]

(3.3)–(3.8)

Our main result, Theorem 1, follows from the theorem above and the decay property of the boundary-layer corrector \( \theta^0 \), once a choice of cut-off function \( \rho \) has been made.

In view of the estimate

\[
\| \theta^0 \|_{L^\infty(0,T;L^2(\Omega))} \approx c \nu^{\frac{1}{4}},
\]

and (3.3), by the triangle inequality we can derive sharp convergence rates in viscosity as an immediate corollary of Theorem 2.

**Corollary 3.** Under the hypotheses of Theorem 2, the following optimal convergence rate holds:

\[
c_1 \nu^{\frac{1}{4}} \leq \| u^\nu - u^0 \|_{L^\infty(0,T;L^2(\Omega))} \leq c_2 \nu^{\frac{1}{4}},
\]

(3.9)

where \( c_1 \) and \( c_2 \) are positive constants, independent of \( \nu \).

The proof of Theorem 2 consists of several parts. We first show that the extra body force terms are small. The \( L^\infty(L^2) \) and \( L^2(H^1) \) estimates then follow directly. Estimates in \( L^\infty(\Omega \times [0,T]) \) are derived, instead, via the maximum principle and the anisotropic embedding theorem. The \( L^\infty(H^1) \) estimate requires a different approach, which entails two distinct bounds, one near boundary, the other in the interior, obtained by introducing a further cut-off function. The convergence of the pressure follows from the convergence of the velocity field.

3.1. Smallness of the extra body forcing terms

We first verify that the extra body forcing terms $A-F$ in the right-hand side of the equations in (3.1) are all small in some appropriate sense. Here and below, with a slight abuse of notation, $c$ denotes a generic constant, independent of the viscosity $\nu$, which may change from line to line. Also, we set $\langle Z \rangle = \sqrt{1 + Z^2}$.

**Lemma 4.** Suppose the initial data $u_0$, the boundary data $\beta$, and the forces $F$ are given as in Proposition 11 in Appendix B. Then the following estimates for $A-F$ given in (2.11) hold:

\[
\|A\|_{L^\infty(0,T;L^2(\Omega))} \leq c\nu^{1/2}, \tag{3.10a}
\]

\[
\|A\|_{L^\infty(0,T;L^1(\Omega))} \leq c\nu^{1/4}, \tag{3.10b}
\]

\[
\|B + C\|_{L^\infty(0,T;L^2(\Omega))} \leq c\nu^{1/4}, \tag{3.10c}
\]

\[
\|D + E + F\|_{L^\infty(0,T;L^2(\Omega))} \leq c\nu^{3/4}, \tag{3.10d}
\]

\[
\|\partial_\phi(D + E + F)\|_{L^\infty(0,T;L^2(\Omega))} \leq c\nu^{3/4}, \tag{3.10e}
\]

\[
\|B + C\|_{L^\infty(0\times[0,T])} \leq c\nu, \tag{3.10f}
\]

\[
\|D + E + F\|_{L^\infty(0\times[0,T])} \leq c\nu, \tag{3.10g}
\]

\[
\|B + C\|_{L^\infty(\Omega \times [0,T])} \leq c\nu, \tag{3.10h}
\]

\[
\|D + E + F\|_{L^\infty(\Omega' \times [0,T])} \leq c\nu, \tag{3.10i}
\]

for any subset $\Omega'$ of $\Omega$ such that the closure $\overline{\Omega'} \subset \Omega$.

**Proof.** We first observe that inequality (3.10a) follows from the estimate:

\[
\|A\|_{L^1(\Omega)} \leq \int_0^1 \left( (\rho\theta_\phi^0)^2 + 2|\rho u_\phi^0| \right) r \, dr \\
\leq c(1 + \|u_\phi^0\|_{L^\infty(\Omega)}) \int_0^1 \left( \theta_\phi^0(t, \frac{1-r}{\sqrt{\nu}}) \right)^2 + \theta_\phi^0(t, \frac{1-r}{\sqrt{\nu}}) \right) \, dr \\
\leq c\nu^{1/2} \left(1 + \|u_\phi^0\|_{L^\infty(\Omega)}\right) \int_0^\infty (\theta_\phi^0(t, Z))^2 + \theta_\phi^0(t, Z) \, dZ \\
\leq c\nu^{1/2}, \tag{3.11}
\]

where we have utilized the regularity and decay properties of the corrector $\theta_\phi^0$ and the fact that the term $A$ contains the cut-off function $\rho$. (See Lemma 9 and Remark 6 in Appendix A for further details.) Estimate (3.10b) is deduced in the similar fashion. The constants $c$ in (3.10a) and (3.10b) depend on the norms of $\|u_0\|_{H^2(\Omega)}$, $\|F\|_{L^\infty(0,T;H^2(\Omega))}$ and $\|\beta\|_{L^\infty(0,T;H^2(\Omega))}$. 

Please cite this article in press as: D. Han et al., Boundary layer for a class of nonlinear pipe flow. J. Differential Equations (2012), doi:10.1016/j.jde.2012.02.012
We now turn to estimates $\|B + C\|_{L^\infty(0,T;L^2(\Omega))}$ and $\|E + F\|_{L^\infty(0,T;L^2(\Omega))}$. Making the change of variable $Z = \frac{1-r}{\sqrt{\rho}}$ in computing $\|\theta^0\|_{L^2(\Omega,\infty)}$ yields a factor of $\nu^2$ in the bounds below, which follow from similar arguments as before:

$$
\|B\|_{L^\infty(0,T;L^2(\Omega))} \leq c v \left\| \Delta (u^0_r e_\rho) \right\|_{L^\infty(0,T;L^2(\Omega))} + c v^\frac{3}{2} \left\| \theta^0 \right\|_{L^\infty(0,T;L^2(\Omega,\infty))},
$$

$$
\|C\|_{L^\infty(0,T;L^2(\Omega))} \leq c v^\frac{3}{2} \left\| \partial_z \theta^0 \right\|_{L^\infty(0,T;L^2(\Omega,\infty))},
$$

$$
\|E\|_{L^\infty(0,T;L^2(\Omega))} \leq c v \left\| \Delta u^0_{\theta,\phi} \right\|_{L^\infty(0,T;L^2(\Omega))} + c v^\frac{3}{2} \left( \|\theta^0\|_{L^\infty(0,T;L^2(\Omega,\infty))} + \|\partial_z \theta^0\|_{L^\infty(0,T;L^2(\Omega,\infty))} \right),
$$

$$
\|F\|_{L^\infty(0,T;L^2(\Omega))} \leq c v^\frac{3}{2} \left\| \partial_z \theta^0 \right\|_{L^\infty(0,T;L^2(\Omega,\infty))}.
$$

These in turn give immediately (3.10c) and (3.10d).

To estimate the norm of $D$, we decompose $D$ into three parts $D = I_1 + I_2 + I_3$, with

$$
\|I_1\|^2_{L^2(\Omega)} = \left\| \rho \left( \frac{\rho}{r} - 1 \right) (\theta^0_{\phi}) \partial_\phi \theta^0_\chi \right\|^2_{L^2(\Omega)}
$$

$$
= \int_0^{2\pi} \int_0^1 \rho^2 \left( \frac{\rho}{r} - 1 \right)^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 r dr d\phi
$$

$$
\leq c \int_0^{2\pi} \int_0^{1/4} (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 r dr + \int_0^{1/2} (r - 1)^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 r dr d\phi
$$

$$
\leq c \int_0^{2\pi} \int_0^{1/4} \nu^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 Z^2 dZ d\phi + \int_{1/4}^{1/2} \int_0^{2\pi} \nu^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 Z^2 dZ d\phi
$$

$$
\leq c v^\frac{3}{2} \|\theta^0\|^2_{L^\infty(0,\infty)} \|\partial_\phi \theta^0_\chi\|^2_{L^2(\Omega,\infty)},
$$

and

$$
\|I_2\|^2_{L^2(\Omega)} = \left\| \rho \left( \frac{u^0_{\phi}(t, r)}{r} - u^0_{\phi}(t, 1) \right) \partial_\phi \theta^0_\chi \right\|^2_{L^2(\Omega)}
$$

$$
= \int_0^{2\pi} \int_0^1 \rho^2 \left( \frac{u^0_{\phi}(t, r)}{r} - u^0_{\phi}(t, 1) \right)^2 (\partial_\phi \theta^0_\chi)^2 r dr d\phi
$$

$$
= \int_0^{2\pi} \int_0^1 \rho^2 \left( \frac{r - 1}{r} \right) \left( \partial_r u^0_{\phi}(t, \xi) - u^0_{\phi}(t, 1) \right)^2 (\partial_\phi \theta^0_\chi)^2 r dr d\phi
$$

$$
\leq c \int_0^{2\pi} \int_0^1 \nu^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 Z^2 dZ d\phi + \int_{1/4}^{1/2} \int_0^{2\pi} \nu^2 (\theta^0_{\phi})^2 (\partial_\phi \theta^0_\chi)^2 Z^2 dZ d\phi
$$

and finally
\[ \left\| I_3 \right\|_{L^2(\Omega)}^2 = \left( \frac{\rho \left( \frac{\partial u_0^0(t, r, \phi)}{r} - \partial_\phi u_0^0(t, 1, \phi) \right) \theta_\phi^0}{\| \partial_\phi u_0^0(t, 1, \phi) \|_{L^2(\Omega)}} \right)^2 \]

\[ = \int_0^{2\pi} \int_0^1 \left( \rho \left( \frac{\partial u_0^0(t, r, \phi)}{r} - \partial_\phi u_0^0(t, 1, \phi) \right) \theta_\phi^0 \right)^2 r \, dr \, d\phi \]

\[ = \int_0^{2\pi} \int_0^1 \left( \rho \frac{r-1}{r} \left( \partial_\phi u_0^0(t, \xi, \phi) - \partial_\phi u_0^0(t, 1, \phi) \right) \theta_\phi^0 \right)^2 r \, dr \, d\phi, \]

\[ \leq c v \frac{1}{\beta} \left( \| \partial_\phi u_0^0 \|_{L^\infty(\Omega)} + \| \partial_\phi u_0^0 \|_{L^\infty(\Omega)} \right) \left\| (Z) \theta_\phi^0 \right\|_{L^2(0, +\infty)}^2. \tag{3.15} \]

We remark that we have imposed enough regularity to ensure the validity of the computations above (see Lemmas 9, 10 and 12 in Appendices A and B). Inequalities (3.10c) and (3.10d) then follow from (3.12)–(3.15) with constants \( c \) depending on \( \| u_0 \|_{H^4(\Omega)} \), \( \| F \|_{L^\infty(0,T; H^4(\Omega))} \) and \( \| \beta \|_{L^\infty(0,T; H^4(\Omega))} \).

Estimates (3.10h) and (3.10i) contain only the forcing terms \( C \), \( D \) and \( F \). We suppose that \( \mathbb{B} \subset B(0, \sigma) \) with \( B(0, \sigma) \) being a ball of radius \( \sigma < 1 \). We discuss in detail how to bound the first term in \( C \), all other terms can be bounded in a similar fashion:

\[ \left\| \frac{1}{r} \rho \frac{\partial Z \theta_\phi^0}{L^2(\mathbb{B})} \right\|_{L^2(\mathbb{B})}^2 \leq c \int_0^\sigma \left( \frac{\partial Z \theta_\phi^0(t, \frac{1-r}{\sqrt{v}})}{L^2(\mathbb{B})} \right) \, dr \]

\[ \leq c v \frac{1}{\beta} \int_0^\sigma \frac{1-r}{\sqrt{v}} \left( \frac{\partial Z \theta_\phi^0(t, \frac{1-r}{\sqrt{v}})}{L^2(\mathbb{B})} \right)^2 \, dr \]

\[ = c v \int_0^1 Z \left( \frac{\partial Z \theta_\phi^0(t, \frac{1-r}{\sqrt{v}})}{L^2(\mathbb{B})} \right)^2 \, dZ \leq c v \left\| (Z) \partial Z \theta_\phi^0 \right\|_{L^2(0, \infty)}^2. \tag{3.16} \]

Finally, (3.10f) is a direct consequence of the estimates for the corrector \( \theta_0^0 \) contained in Lemmas 9 and 10, as well as the regularity of solutions to the Euler equations stated in Lemma 12. The constant \( c \) here depends on \( \| u_0 \|_{H^4(\Omega)} \), \( \| F \|_{L^\infty(0,T; H^4(\Omega))} \) and \( \| \beta \|_{L^\infty(0,T; H^4(\Omega))} \). One can derive (3.10g) similarly to (3.10d) employing the \( L^\infty \) norm instead. The constant \( c \) in (3.10g) depends, however, on more regular data in \( H^7(\Omega) \), see Lemma 10. \( \square \)

**Remark 1.** It is mentioned that the interior estimates can be improved up to any order of \( v \) for terms \( C \), \( D \), \( F \). However, the interior estimates (3.10h) and (3.10i) are optimal because of the appearance of \( \Delta u_0^0 \) and \( \Delta u_0^0 \) in terms \( B \) and \( E \).

**Remark 2.** We did not try to optimize the regularity condition we imposed on the data \( u_0 \), \( F \) and \( \beta \), because the boundary layer exists even if the data is assumed smooth.

### 3.2. The \( L^\infty(L^2) \) and \( L^2(H^1) \) convergence

We recall that the error solution \( u^{err} = u^v - \bar{u}^{app} \), \( p^{err} = p^v - p_0 \) satisfies the system (3.1)–(3.2).

It will be convenient here to work in Cartesian rather than cylindrical coordinates. We observe that Eqs. (3.1b), (3.1c) together with the initial–boundary conditions (3.2) form a closed weakly coupled parabolic system which can be rewritten in Cartesian coordinates as

---

Please cite this article in press as: D. Han et al., Boundary layer for a class of nonlinear pipe flow. J. Differential Equations (2012), doi:10.1016/j.jde.2012.02.012
\[
\begin{align*}
\partial_t \mathbf{v}^{err} - \nu \Delta_v \mathbf{v}^{err} &= \mathbf{g}_2, \\
\partial_t v_3^{err} + (\mathbf{u}_v^r \cdot \nabla) v_3^{err} - \nu \Delta_v v_3^{err} &= \mathbf{g}_3,
\end{align*}
\]

where \( \mathbf{v}^{err} \equiv \mathbf{u}^{err} \) in Cartesian coordinates, that is,

\[
\mathbf{v}^{err}(t, x_1, x_2) = (v_1^{err}, v_2^{err}, v_3^{err}) := \mathbf{u}^{err}_r e_r + \mathbf{u}^{err}_\phi e_\phi + \mathbf{u}^{err}_x e_x
\]

with

\[
\begin{align*}
v_1^{err}(t, x_1, x_2) &= -u_\phi^{err} \sin \phi, \\
v_2^{err}(t, x_1, x_2) &= u_\phi^{err} \cos \phi, \\
v_3^{err}(t, x_1, x_2) &= u_x^{err},
\end{align*}
\]

\[
\mathbf{v}^{err} = v_1^{err} \mathbf{e}_1 + v_2^{err} \mathbf{e}_2 + v_3^{err} \mathbf{e}_3 = \mathbf{u}^{err}_r e_r + \mathbf{u}^{err}_\phi e_\phi,
\]

Together with homogeneous initial and boundary conditions

\[
\begin{align*}
\mathbf{v}^{err}|_{t=1} &= 0, \\
\mathbf{v}^{err}|_{t=0} &= 0.
\end{align*}
\]

The forcing terms \( \mathbf{g}_2, \mathbf{g}_3 \) are given by

\[
\begin{align*}
\mathbf{g}_2 &= -(B + C) \left( -\frac{x_2}{\sqrt{x_1^2 + x_2^2}}, \frac{x_1}{\sqrt{x_1^2 + x_2^2}} \right), \\
\mathbf{g}_3 &= -(D + E + F) - (\mathbf{v}^{err}_v \cdot \nabla) \tilde{u}_{app}.
\end{align*}
\]

We notice that the cross-sectional component \( \mathbf{v}^{err}_v \) satisfies a two-component (scalar) heat equation (3.17a). Therefore standard energy estimates and the maximum principle together with the estimates (3.10c) and (3.10f) in Lemma 4 yield

\[
\begin{align*}
\left\| \mathbf{v}^{err}_v \right\|_{L^\infty(0,T;L^2(\Omega))} &\leq c v^{\frac{1}{2}}, \\
\left\| \mathbf{v}^{err}_v \right\|_{L^2(0,T;H^1(\Omega))} &\leq c v^{\frac{1}{2}}, \\
\left\| \mathbf{v}^{err}_v \right\|_{L^1(0,T;H^1(\Omega))} &\leq c v^{\frac{1}{2}}, \\
\left\| \mathbf{v}^{err}_v \right\|_{L^\infty(\Omega \times [0,T])} &\leq c v^{\frac{1}{2}}.
\end{align*}
\]

For later use, we also derive an interior estimate on \( \left\| \mathbf{v}^{err}_v \right\|_{L^\infty(0,T;L^2(\Omega'))) \) for \( \Omega' \subset \Omega \). Let \( \eta(r) \) be a smooth function with compact support in \( \Omega \). Multiplying Eq. (3.17a) by \( \eta^2 \mathbf{v}^{err}_v \) and integrating the resulting equations by parts leads to

\[
\begin{align*}
\frac{1}{2} \frac{d}{dt} \left[ \eta \mathbf{v}^{err}_v \right]_{L^2(\Omega)}^2 + \nu \left\| \eta \nabla \mathbf{v}^{err}_v \right\|_{L^2(\Omega)}^2 &\leq c \left\| B + C \right\|_{L^2(\Omega)} \left\| \eta \mathbf{v}^{err}_v \right\|_{L^2(\Omega)} - \nu \int_\Omega \nabla \mathbf{v}^{err}_v \cdot (2\eta \nabla \eta) \cdot \mathbf{v}^{err}_v \, dx \\
&\leq c v \left\| \eta \mathbf{v}^{err}_v \right\|_{L^2(\Omega)}^2 + c v^2 \left\| \eta \nabla \mathbf{v}^{err}_v \right\|_{L^2(\Omega)},
\end{align*}
\]
where we have employed (3.10h) in Lemma 4 and the $L^\infty(L^2)$ estimate in (3.20). Applying first Cauchy’s inequality, and then Grönwall’s inequality, we then obtain

$$
\| \eta \mathbf{v}_x^{err} \|_{L^\infty(0,T;L^2(\Omega))} + \nu^{1/2} \| \eta \nabla \mathbf{v}_x^{err} \|_{L^2(0,T;L^2(\Omega))} \leq c \nu.
$$

(3.22)

We now notice that the last term in $g_3$ can be rewritten as:

$$
(\mathbf{v}_x^{err} \cdot \nabla \mathbf{v}_x) \tilde{u}_{x,app} = \frac{u_{x,app}}{r} \partial_\phi \tilde{u}_{x,app}.
$$

We then conclude again from the definition of $u_{app}$ given in (2.8), the decay properties of the corrector $\theta_0$ found in Appendix A, and the regularity of solutions to the Euler system in Lemma 12, that

$$
\left\| \frac{1}{r} \partial_\phi \tilde{u}_{x,app} \right\|_{L^\infty(\Omega \times [0,T])} \leq c,
$$

(3.23)

with a constant $c$ depending on $\| \mathbf{u}_0 \|_{H^3(\Omega)}$, $\| \mathbf{F} \|_{L^\infty(0,T;H^1(\Omega))}$, and $\| \beta \|_{L^\infty(0,T;H^1(\Omega))}$, but independent of $\nu$. Therefore one has the following uniform estimates by (3.20) and (3.23):

$$
\left\| (\mathbf{v}_x^{err} \cdot \nabla \mathbf{v}_x) \tilde{u}_{x,app} \right\|_{L^\infty(\Omega \times [0,T])} \leq c \nu^{1/2}.
$$

(3.24)

Applying the same energy argument to Eq. (3.17b) gives

$$
\| \mathbf{v}_x^{err} \|_{L^\infty(0,T;L^2(\Omega))} \leq c \nu^{3/4},
$$

$$
\| \mathbf{v}_3^{err} \|_{L^2(0,T;H^1(\Omega))} \leq c \nu^{1/4},
$$

$$
\| \mathbf{v}_3^{err} \|_{L^\infty(0,T;L^2(\Omega))} \leq c \nu,
$$

(3.25)

by inequalities (3.10d), (3.10i) in Lemma 4 and estimates (3.20), (3.22), (3.24).

3.3. Uniform in space and time convergence

We begin by observing that the uniform convergence of the tangential component $\mathbf{v}_x^{err}$ has been already derived in the previous subsection via the maximum principle. Similar uniform estimates on $\mathbf{v}_3^{err}$ can be derived via maximum principle as well since $\mathbf{v}_3^{err}$ satisfies a (scalar) advection–diffusion equation with source term. For this purpose, we define the differential operator $L$ by

$$
L = \partial_t + \mathbf{u}_x^{err} \cdot \nabla \mathbf{v}_x - \nu \Delta.
$$

A simple calculation shows that

$$
L(\mathbf{v}_3^{err}) \leq L \left( \int_0^T \| g_3(s) \|_{L^\infty(\Omega)} \, ds \right), \quad \text{and} \quad \mathbf{v}_3^{err} \leq \int_0^T \| g_3(s) \|_{L^\infty(\Omega)} \, ds, \quad \text{on } \mathcal{P} \Omega
$$

where $\mathcal{P} \Omega$ is the parabolic boundary of the domain $\Omega \times [0,T]$. Then the comparison principle for linear parabolic equations (see e.g. [35]) implies that $\mathbf{v}_3^{err} \leq \int_0^T \| g_3(s) \|_{L^\infty(\Omega)} \, ds$ in $\Omega \times [0,T]$. Similarly, we have $\mathbf{v}_3^{err} \geq - \int_0^T \| g_3(s) \|_{L^\infty(\Omega)} \, ds$. One then concludes from estimates (3.10g), (3.20) and (3.23) that
Lemma 5. In order to separate the boundary layer from the interior, we introduce a further cut-off function based on the better control we have on tangential derivatives even in the presence of local gradients of the error solution. Any function $u$ with an appropriately chosen support in $\{x \in \Omega, \text{dist}(x, \partial \Omega) \leq \varepsilon\}$ was already obtained in (3.20). This estimate is the most interesting given that it involves normal derivatives of $\psi$. The goal of this section is to derive a standard interior energy estimate away from the boundary layer. This alternative approach has the advantage that it can handle systems where the flat case result (see Lemma 5 below, which is a counterpart of Remark 4.2 in [20]) Away from the boundary, the other in the interior. Near the boundary, curvilinear coordinates allow to generalize the maximum principle may be invalid. This dual approach will be utilized to derive $L^\infty(H^1)$ estimates.

Remark 3. An alternative proof of uniform bounds in $L^\infty(\Omega \times [0, T])$ is based on the use of anisotropic Sobolev-type embedding (see for instance [20,13] for the case of flat boundary). In the case, as our setting, of curved boundaries, the main idea is to perform separate estimates, one valid next to the boundary, the other in the interior. Near the boundary, curvilinear coordinates allow to generalize the flat case result (see Lemma 5 below, which is a counterpart of Remark 4.2 in [20]). Away from the boundary, on the other hand, we expect to employ a direct energy estimate due to the absence of the boundary layer. This alternative approach has the advantage that it can handle systems where the maximum principle may be invalid. This dual approach will be utilized to derive $L^\infty(H^1)$ estimates.

Lemma 5. Suppose the domain $\Omega$ is an annulus, i.e., $\Omega = \{(r, \theta) \mid 0 < R_1 < r < R_2, \theta \in (0, 2\pi)\}$. Then for any function $u \in H^1(\Omega)$ satisfying either $u|_{r=R_1} = 0$ or $u|_{r=R_2} = 0$, there exists a constant $C$ depending only on $R_1$ such that

$$
\|u\|_{L^\infty(\Omega)} \leq C \left( \left\|u\right\|_{L^2(\Omega)}^2 + \left\|\frac{\partial u}{\partial r}\right\|_{L^2(\Omega)}^2 + \left\|\frac{\partial u}{\partial \theta}\right\|_{L^2(\Omega)}^2 + \left\|\frac{\partial^2 u}{\partial r \partial \theta}\right\|_{L^2(\Omega)}^2 \right).
$$

(3.27)

The proof is straightforward via Agmon-type embedding in the azimuthal direction together with embedding (interpolation) in the radial direction. Generalization to general curvilinear coordinates as well as high dimension can be considered as well.

3.4. Convergence in $L^\infty(H^1)$

The goal of this section is to derive $L^\infty(H^1)$ estimate for $v^\text{err}_3$, given that an $L^\infty(H^1)$ estimate of $v^\text{err}_3$ was already obtained in (3.20). This estimate is the most interesting given that it involves normal gradients of the error solution.

We employ again the two-step approach described above: first, we derive an estimate near the boundary based on the better control we have on tangential derivatives even in the presence of a boundary layer; second, we derive a standard interior energy estimate away from the boundary layer. In order to separate the boundary layer from the interior, we introduce a further cut-off function $\psi(r)$ with an appropriately chosen support in $\Omega$ (to be specified below).

Let us denote $w = \psi u^\text{err}_x = \psi v^\text{err}_3$. Then $w$ satisfies the following equation written in polar coordinates:

$$
\begin{align*}
\partial_t w + \frac{\psi}{r} \partial_r w - \frac{\psi}{r} \partial_r (r \partial_r w) - \frac{\psi}{r^2} \partial_\phi w &= -\frac{\psi u^\text{err}_x}{r} \partial_\phi \hat{u}^\text{app}_x - \psi (D + E + F) - \nu u^\text{err}_x \Delta_\psi - 2 \nu \psi'(r) \partial_r u^\text{err}_x. \\
&= -\frac{\psi u^\text{err}_x}{r} \partial_\phi \hat{u}^\text{app}_x - \psi (D + E + F) - \nu u^\text{err}_x \Delta_\psi - 2 \nu \psi'(r) \partial_r u^\text{err}_x. 
\end{align*}
$$

(3.28)

with homogeneous initial and boundary conditions

$$
\begin{align*}
w|_{r=1} &= 0, \\
w|_{r=0} &= 0.
\end{align*}
$$
3.4.1. Estimate near the boundary

To emphasize that this is a construction near the boundary, we will write \( \psi_b(r) \) for \( \psi(r) \) and \( w_b \) for \( w \) in (3.28). We take \( \psi_b(r) \) to be a smooth function defined on \([0, 1]\) such that

\[
\psi_b (r) = \begin{cases} 
1, & r \in \left[ \frac{1}{2}, 1 \right], \\
0, & r \in [0, \frac{1}{2}]. 
\end{cases}
\]  

(3.29)

First, we multiply Eq. (3.28) by \(-\partial_\phi w_b \cdot r\) and then integrate in \(r\) and \(\phi\), in light of estimate (3.10e) in Lemma 4.

\[
\frac{1}{2} \frac{d}{dt} \left\| \partial_\phi w_b \right\|^2_{L^2(\Omega)} + v \left\| \partial_{r\phi} w_b \right\|^2_{L^2(\Omega)} + v \left\| \partial_{\phi r} w_b \right\|^2_{L^2(\Omega)} \leq c \left( \| \psi_b \partial_\phi D \|_{L^2(\Omega)} + \| \psi_b \partial_\phi E \|_{L^2(\Omega)} + \| \psi_b \partial_\phi F \|_{L^2(\Omega)} \\
+ \left( \| \Delta u^\phi \|_{L^\infty(\Omega^c)} + \| \partial_\phi \partial_\theta \|_{L^\infty(\Omega^c)} \right) \| \psi u^\phi_{\text{app}} \|_{L^2(\Omega)} \| \partial_\phi w_b \|_{L^2(\Omega)} + \| \partial_\phi u^\phi \|_{L^2(\Omega)} \| \psi \|_{L^2(\Omega)} \right) \leq c v \frac{3}{2} \left\| \partial_\phi w_b \right\|_{L^2(\Omega)} + c v \left\| \frac{\partial_\phi w_b}{r} \right\|_{L^2(\Omega)}.
\]  

Then it follows from Grönwall’s inequality and estimate (3.25) that

\[
\left\| \partial_\phi w_b \right\|_{L^\infty(0,T;L^2(\Omega))} + \sqrt{v} \left( \left\| \partial_{r\phi} w_b \right\|_{L^2(0,T;L^2(\Omega))} + \left\| \frac{\partial_\phi w_b}{r} \right\|_{L^2(0,T;L^2(\Omega))} \right) \leq c v \frac{3}{2}. 
\]  

(3.31)

In order to obtain an estimate for \( \partial_r w_b \), we multiply by \(-\frac{1}{r} \partial_r (r \partial_r w_b) \cdot r\) on both sides of Eq. (3.28) and integrate it by parts

\[
\frac{1}{2} \frac{d}{dt} \left\| \partial_r w_b \right\|^2_{L^2(\Omega)} + v \left\| \frac{1}{r} \partial_r (r \partial_r w_b) \right\|^2_{L^2(\Omega)} + v \left\| \frac{\partial_\phi w_b}{r} \right\|^2_{L^2(\Omega)} \leq c \left( \left\| u^\phi_{\text{app}} \right\|_{L^\infty(\Omega)} + \left\| \partial_\phi u^\phi \right\|_{L^\infty(\Omega)} \right) \left\| \partial_\phi w_b \right\|_{L^2(\Omega)} + v \left\| \partial_\phi u^\phi \right\|_{L^2(\Omega)} \left\| \partial_r u^\phi \right\|_{L^2(\Omega)} \left\| \partial_\phi u^\phi \right\|_{L^2(\Omega)} \left\| \partial_r u^\phi \right\|_{L^2(\Omega)} \right) + c v \left\| \partial_\phi w_b \right\|_{L^2(\Omega)} \left\| \frac{\partial_\phi w_b}{r} \right\|_{L^2(\Omega)}.
\]  

(3.32)

Young’s inequality and Grönwall’s inequality then yield

\[
\left\| \partial_r w_b \right\|_{L^\infty(0,T;L^2(\Omega))} + \sqrt{v} \left\| \frac{1}{r} \partial_r (r \partial_r w_b) \right\|_{L^2(0,T;L^2(\Omega))} + \sqrt{v} \left\| \frac{\partial_\phi w_b}{r} \right\|_{L^2(0,T;L^2(\Omega))} \leq c v \frac{1}{2},
\]

(3.33)

where we have used estimates (3.23) and (3.31).
3.4.2. Interior estimate

We now turn to the estimates in the interior of \( \Omega \). To this end, we let \( \psi_i(r) = 1 - \psi_b(r) \) so that

\[
\psi_i(r) = \begin{cases} 
1, & r \in [0, \frac{1}{2}], \\
0, & r \in [\frac{2}{3}, 1]. 
\end{cases} 
\]  

(3.34)

We rewrite Eq. (3.28) in Cartesian coordinates as

\[
\partial_t w_i + (u_\nu \cdot \nabla v) w_i - v \Delta_v w_i = -\psi_i(\xi + E + F) - v v_\nu^{err} \Delta_v \psi_i - 2 \psi_i'(r) \partial_r v_3^{err} - ((\psi_i v_\nu^{err}) \cdot \nabla v) \tilde{u}_{\nu}^{opp}, 
\]  

(3.35)

with homogeneous initial and boundary conditions.

Multiplying (3.35) by \( w_i \) and integrating the resulting equation over \( \Omega \) gives

\[
\frac{1}{2} \frac{d}{dt} \| w_i \|_{L^2(\Omega)}^2 + v \| \nabla_v w_i \|_{L^2(\Omega)}^2 
\leq \| \psi_i(\xi + E + F) \|_{L^2(\Omega)} \| w_i \|_{L^2(\Omega)} + cv \| v_\nu^{err} \|_{H^1(\Omega)} \| w_i \|_{L^2(\Omega)}
+ c \left\| \frac{\partial_phi \tilde{u}_{\nu}^{opp}}{r} \right\|_{L^\infty(\Omega)} \| \psi_i u_\nu^{err} \|_{L^2(\Omega)} \| w_i \|_{L^2(\Omega)}. 
\]  

(3.36)

By utilizing the estimates (3.10i), (3.22), (3.25), and the tangential estimate on the approximate solution (3.23), we deduce that

\[
\| w_i \|_{L^\infty(0,T;L^2(\Omega))} + v \frac{1}{2} \| \nabla_v w_i \|_{L^2(0,T;L^2(\Omega))} \leq c v. 
\]  

(3.37)

In particular,

\[
\| \nabla_v w_i \|_{L^2(0,T;L^2(\Omega))} \leq c v^{\frac{1}{2}}. 
\]  

(3.38)

Furthermore, by multiplying Eq. (3.35) by \( -\Delta_v w_i \) and integrating over the domain \( \Omega \), one has that

\[
\frac{1}{2} \frac{d}{dt} \| \nabla_v w_i \|_{L^2(\Omega)}^2 + v \| \Delta_v w_i \|_{L^2(\Omega)}^2 
\leq \| \psi_i(\xi + E + F) \|_{L^2(\Omega)} \| \Delta_v w_i \|_{L^2(\Omega)} + v \| v_\nu^{err} \|_{H^1(\Omega)} \| \Delta_v w_i \|_{L^2(\Omega)}
+ c \left\| \frac{\partial_phi \tilde{u}_{\nu}^{opp}}{r} \right\|_{L^\infty(\Omega)} \| \psi_i u_\nu^{err} \|_{L^2(\Omega)} \| \Delta_v w_i \|_{L^2(\Omega)} + \int_\Omega (u_\nu \cdot \nabla v) w_i \Delta_v w_i \; dx. 
\]  

(3.39)

We now recall that \( \tilde{u}_{\nu}^{opp} = \tilde{u}_{\nu}^{opp} e_\phi \), that \( \nabla_v \cdot u_\nu^{opp} = 0 \), and that \( u_\nu = v^{err} + \tilde{u}_{\nu}^{opp} \). Consequently, all terms in the right-hand side of Eq. (3.39) except the last one can be estimated in the same way as in (3.36)–(3.37). We deal with the last term as follows:

\[
\int_\Omega (u_\nu \cdot \nabla v) w_i \Delta_v w_i \; dx
= \int_\Omega (v^{err} \cdot \nabla v) w_i \Delta_v w_i \; dx + \int_\Omega \tilde{u}_{\nu}^{opp} \cdot \nabla v) w_i \Delta_v w_i \; dx
\]
\[ \leq c v^\frac{3}{2} \| \nabla w_i \|_{L^2(\Omega)} \| \Delta w_i \|_{L^2(\Omega)} - \int_{\Omega} (\nabla \cdot \tilde{u}_{\text{app}} \cdot \nabla w_i) \cdot \nabla w_i \, dx \]

\[ \leq c \| \nabla w_i \|_{L^2(\Omega)}^2 + \frac{v}{4} \| \Delta w_i \|_{L^2(\Omega)}^2 + \| \nabla \tilde{u}_{\text{app}} \|_{L^\infty(\Omega')} \| \nabla w_i \|_{L^2(\Omega)}^2 \]

\[ \leq c (\| u_\phi^0 \|_{H^{2+\epsilon}(\Omega')} + \| \nabla \tilde{u}_{\text{app}} \|_{L^\infty(\Omega')}) \| \nabla w_i \|_{L^2(\Omega)}^2 + c \| \nabla w_i \|_{L^2(\Omega)}^2 + \frac{v}{4} \| \Delta w_i \|_{L^2(\Omega)}^2 \]

(3.40)

where \( \Omega' = (r \leq \frac{3}{2}) \) by the definition of the cut-off function (3.34). By introducing (3.40) back into (3.39), applying Young’s inequality, integrating in time \( t \), we finally obtain, utilizing (3.38),

\[ \| \nabla w \|_{L^\infty(0,T;L^2(\Omega))} \leq c v^\frac{1}{2} . \]

Combining estimates (3.25), (3.31), (3.33) and (3.41) gives the desired estimate

\[ \| v_{\text{err}} \|_{L^\infty(0,T;H^1(\Omega))} \leq c v^\frac{1}{2} . \]

(3.42)

Remark 4. An alternative way of deriving the \( L^\infty(H^1) \) estimate is to include higher-order terms in the asymptotic expansion (2.1)–(2.2). We address this point in Section 4.

3.5. Convergence of the pressure

We first recall the following calculus formula for a vector function \( u = v(r) e_\phi \)

\[ \nabla u = \begin{pmatrix} -\partial_r v \sin \phi e_r - \frac{v}{r} \cos \phi e_\phi \\ \partial_r v \cos \phi e_r - \frac{v}{r} \sin \phi e_\phi \end{pmatrix} . \]

(3.43)

Then it follows directly from Eq. (3.1a) that

\[ \| \partial_r p_{\text{err}} \|_{L^2(\Omega)} \leq \left\| \frac{(u_\phi^\text{err})^2}{r} \right\|_{L^2(\Omega)} + \left\| \frac{2u_\phi^\text{err} \tilde{u}_{\text{app}}}{r} \right\|_{L^2(\Omega)} + \left\| \frac{A}{r} \right\|_{L^2(\Omega)} \]

\[ \leq \left( \| u_\phi^\text{err} \|_{L^\infty(\Omega)} + 2 \| \tilde{u}_{\text{app}} \|_{L^\infty(\Omega)} \right) \| \frac{u_\phi^\text{err}}{r} \|_{L^2(\Omega)} + c v^\frac{1}{2} \]

\[ \leq c \| \nabla v_{\text{err}} \|_{L^2(\Omega)} + c v^\frac{1}{2} \leq c v^\frac{1}{2} \]

(3.44)

where we used the estimates (3.10b) and (3.20) as well as the calculus identity above.

Next, we integrate Eq. (3.1a) to find that, assuming \( p_{\text{err}}(1) = 0 \)

\[ -p_{\text{err}} = \int_{r}^{1} \frac{(u_\phi^\text{err})^2}{s} + \frac{2u_\phi^\text{err} \tilde{u}_{\text{app}}}{s} - \frac{A}{s} \, ds . \]

(3.45)

Therefore estimates (3.10a) and (3.20) yield

\[ \| p_{\text{err}} \|_{L^\infty(\Omega)} \leq \left\| \frac{u_\phi^\text{err}}{s} \right\|_{L^2(\Omega)} + c \left( \left\| \frac{u_\phi^0}{r} \right\|_{L^\infty(\Omega)} + \left\| \phi^0 \right\|_{L^\infty(0,+,\infty)} \right) \| u_\phi^\text{err} \|_{L^2(\Omega)} + c \left\| \frac{A}{s} \right\|_{L^2(\Omega)} \]

\[ \leq \| \nabla v_{\text{err}} \|_{L^2(\Omega)}^2 + c_1 v^\frac{1}{2} + c_2 v^\frac{1}{2} \leq c v^\frac{1}{2} . \]

(3.46)
4. Improved convergence rate

We ask whether the rates of convergence in viscosity presented in our main theorem, Theorem 1, are optimal. A heuristic argument using the order of the expansion in $\nu$ indicates that some of the rates are suboptimal. Optimal rate of convergence can be deduced by formally expanding the Navier-Stokes solution to higher orders as it is classically done (see for instance [12,15,33] among others). However, expanding to higher order requires correspondingly more stringent compatibility conditions between the initial and boundary data, as discussed in Appendix B. Below, we present an asymptotic expansion up to the first order (which is the next order) to illustrate the point and for the sake of simplicity.

4.1. Formal asymptotics

Similarly to (2.1) and (2.2), we now assume that the approximate Navier-Stokes solution has the form:

$$u^{\text{app},1}(t, r, \phi) := u^{\text{ou}}(t, r) + u^{\text{c}}(t, 1 - r \sqrt{\nu}, \phi),$$

$$p^{\text{app},1}(t, r) := p^0(t, r) + \sqrt{\nu} p^1(t, r) + \sqrt{\nu} q^1(t, 1 - r \sqrt{\nu}),$$

where

- $u^{\text{ou}}(t, r, \phi) = u^0(t, r)$ is the outer solution, valid in $\Omega$;
- $u^{\text{c}}(t, 1 - r \sqrt{\nu}, \phi) = \theta^0(t, 1 - r \sqrt{\nu}, \phi)$ is the corresponding boundary-layer solution, which is valid in $\Omega_\infty$.

In terms of the stretched coordinate $Z = 1 - r \sqrt{\nu}$ the corrector satisfies the following matching conditions

$$\theta^i \to 0 \quad \text{as} \quad Z \to \infty,$$

where $i = 0, 1$.

The equations satisfied by the outer solutions and correctors can be easily derived by keeping only terms with the same order in $\nu$:

1. The leading order $u^0(t, r, \phi) = (0, u^0_t(t, r), u^0_x(t, r, \phi))$ satisfies reduced Euler equation (1.12) with initial data (1.13).

2. The first order of outer solution $u^1(t, r, \phi) = (u^1_t(t, r), u^1_x(t, r, \phi))$ satisfies the following equations

$$-2u^0_t u^1 + r \partial_t p^1 = 0,$$

$$\partial_t u^1 = 0,$$

$$\partial_t u^1_x + \frac{u^0_t}{r} \partial_\phi u^1_x + \frac{u^0_x}{r} \partial_\phi u^0_x = 0,$$

$$(u^1_\phi, u^1_x)|_{t=0} = (0, 0).$$

Since $(u^1_\phi, u^1_x)$ satisfies transport equations with homogeneous initial data, it follows that $(u^1_\phi, u^1_x) \equiv 0$, and consequently, we can take $p^1 = 0$ for convenience.

3. The leading order of the boundary-layer profile $\theta^0(t, Z, \phi)$ satisfies system (2.4) in Section 2.
4. The first order of the boundary-layer profile $\theta^1(t, Z, \phi) = (0, \theta^1_\phi, \theta^1_x)$ satisfies the following system:

\begin{align}
(\theta^0_\phi)^2 + 2u^0_\phi(t, 1)\theta^0_\phi &= -\partial_Z q^1,

\partial_t \theta^1_\phi &= \partial_Z \theta^1_\phi - \partial_Z \theta^0_\phi,

\partial_t \theta^1_x + u^0_\phi(t, 1)\partial_\phi \theta^1_x + \theta^0_\phi \partial_\phi \theta^1_x - \partial_Z \theta^1_x &= -\theta^1_\phi \partial_\phi \theta^0_\phi - \theta^1_x \partial_\phi \theta^0_x + Z \theta^0_\phi \partial_\phi u^0_\phi(t, 1) - \partial_\phi u^0_\phi(t, 1, \phi))

+ Z (\partial_t u^0_\phi(t, 1) - u^0_\phi(t, 1)) \partial_\phi \theta^0_x - Z \theta^0_\phi \partial_\phi \theta^0_x - \partial_Z \theta^0_x,

(\theta^1_\phi, \theta^1_x)|_{Z=0} &= (0, 0),

(\theta^1_\phi, \theta^1_x)|_{Z=\infty} = 0, \quad (\theta^1_\phi, \theta^1_x)|_{t=0} = 0. \quad (4.5)
\end{align}

The existence, regularity, and decay properties of solutions to system (4.5) can be derived in a manner similar to that for the system satisfied by the zeroth-order expansion under higher regularity assumptions and higher compatibility conditions between the initial data and boundary data, as illustrated in Appendix A.

4.2. Approximate solution

The formal expansion $u^{app.1}$ presented in the previous subsection cannot be directly used to accommodate for the fact that the decay properties of the corrector arise in an infinite domain. As in Section 2, we remedy this point by introducing a truncation factor in the radial direction. We then define a truncated approximation $u^{app.1}(t, r, \phi) = (\tilde{u}^{app.1}_\phi(t, r), \tilde{u}^{app.1}_x(t, r, \phi))$ with

\begin{align}
\tilde{u}^{app.1}_\phi(t, r) &= u^0_\phi(t, r) + \rho(r)(\theta^0_\phi + \sqrt{v} \theta^1_\phi) \left( t, \frac{1-r}{\sqrt{v}} \right),

\tilde{u}^{app.1}_x(t, r, \phi) &= u^0_x(t, r, \phi) + \rho(r)(\theta^0_x + \sqrt{v} \theta^1_x) \left( t, \frac{1-r}{\sqrt{v}}, \phi \right),

\tilde{p}^{app}(t, r) &= p^0(t, r) + \sqrt{v} q^1 \left( t, \frac{1-r}{\sqrt{v}} \right), \quad (4.6)
\end{align}

where $\rho$ is defined in Section 2.

Then $\tilde{u}^{app.1}$ satisfies the following system

\begin{align}
-(\tilde{u}^{app.1}_\phi)^2 + r \partial_r \tilde{p}^{app.1} &= \hat{A},

\partial_t \tilde{u}^{app.1}_\phi - \frac{v}{r} \partial_r (r \partial_r \tilde{u}^{app.1}_\phi) + \frac{v}{r^2} \tilde{u}^{app.1}_\phi &= f_1 + \hat{B} + \hat{C} + G,

\partial_t \tilde{u}^{app.1}_x + \frac{\tilde{u}^{app.1}_\phi}{r} - \partial_\phi \tilde{u}^{app.1}_x - \frac{v}{r} \partial_r (r \partial_r \tilde{u}^{app.1}_x) - \frac{v}{r^2} \partial_\phi \tilde{u}^{app.1}_x &= f_2 + \hat{D} + \hat{E} + \hat{F} + H, \quad (4.7)
\end{align}

where $\hat{A}, \hat{B}, \hat{C}, \hat{D}, \hat{E}, \hat{F}$ and $H$ are given by.
\[
\hat{A} = (r - \rho^2)\left(\theta_{\phi}^0\right)^2 + 2\theta_{\phi}^0(r\theta_{\phi}^0(t, 1) - \theta_{\phi}^0) - 2\sqrt{v}(u_{\phi}^0 + \rho\theta_{\phi}^0)\theta_{\phi}^1 - v\rho^2(\theta_{\phi}^0)^2.
\]

\[
\hat{B} = v\left[-\frac{1}{r}\partial_r(r\partial_ru_{\phi}^0) + \frac{1}{r^2}u_{\phi}^0 - \frac{1}{r}\rho'(r)\theta_{\phi}^0 + \frac{1}{r^2}\rho\theta_{\phi}^0 - \rho''(r)\theta_{\phi}^0 + \frac{\rho}{r}\partial_Z\theta_{\phi}^1 + 2\rho'(r)\partial_Z\theta_{\phi}^0\right].
\]

\[
\hat{C} = \sqrt{v}\left[\rho\left(\frac{1}{r} - 1\right)\partial_Z\theta_{\phi}^0 + 2\rho'(r)\partial_Z\theta_{\phi}^0\right],
\]

\[
G = v^3\left[\frac{\rho}{r^2}\theta_{\phi}^1 - \theta_{\phi}^0 - \rho''(r)\theta_{\phi}^1\right].
\]

\[
\hat{D} = \rho\left[\frac{\partial \phi u_{\phi}^0}{r} - \partial_r u_{\phi}^0(t, 1, \phi) + \sqrt{vZ(\partial_r u_{\phi}^0(t, 1, \phi) - \partial_r u_{\phi}^0(t, 1, \phi))}\theta_{\phi}^0\right.
\]

\[
+ \rho(r)\left[u_{\phi}^0 - \partial_r u_{\phi}^0(t, 1) + \sqrt{vZ(\partial_r u_{\phi}^0(t, 1) - \partial_r u_{\phi}^0(t, 1))}\theta_{\phi}^0\right]
\]

\[
+ \rho(r)\left(\frac{\rho}{r} - 1 - \sqrt{vZ}\right)\theta_{\phi}^0\partial_z\theta_{\phi}^0,
\]

\[
\hat{E} = \sqrt{v}\left[\rho\left(\frac{\rho}{r} - 1\right)(\theta_{\phi}^0\partial_z\theta_{\phi}^0 + \theta_{\phi}^1\partial_z\theta_{\phi}^0) + \rho\left(\frac{1}{r} - 1\right)\partial_z\theta_{\phi}^0 + 2\rho'\partial_z\theta_{\phi}^0\right.
\]

\[
+ \rho\left(\frac{\partial \phi u_{\phi}^0}{r} - \partial_r u_{\phi}^0(t, 1, \phi)\right)\theta_{\phi}^1 + \rho\left(u_{\phi}^0 - \partial_\phi u_{\phi}^0(t, 1, \phi)\right)\theta_{\phi}^1\right],
\]

\[
H = v\left[-\frac{1}{r}\partial_r(r\partial_ru_{\phi}^0) - \left(\rho' + \rho''\right)\theta_{\phi}^0 + \left(\rho' + 2\rho''\right)\partial_\phi\theta_{\phi}^1 + \frac{\rho^2}{r}\theta_{\phi}^1\partial_z\theta_{\phi}^0 - \frac{1}{r^2}\partial_\phi u_{\phi}^0 - \frac{\rho}{r^2}\partial_\phi\theta_{\phi}^0\right].
\]

\[
\hat{F} = v^2\left[-\rho'\partial_z\theta_{\phi}^0 - \rho''\partial_z\theta_{\phi}^0 - \frac{\rho}{r^2}\partial_\phi\theta_{\phi}^0\right].
\]

(4.8)

The corresponding boundary conditions and initial data are imposed as

\[
\tilde{u}^{\text{app.1}}|_{t=0} = (0, a(r), b(r, \phi)),
\]

\[
\tilde{u}^{\text{app.1}}|_{r=1} = (0, \beta_\phi(t), \beta_\phi(t, \phi)).
\]

4.3. Convergence

We define again an error solution \( \tilde{u}^{\text{err}}(t, r, \phi) := (\tilde{u}_{\phi}^{\text{err}}(t, r, \phi), \tilde{u}_{\phi}^{\text{err}}(t, r, \phi)) \) and \( \tilde{p}^{\text{err}} \), where

\[
\tilde{u}_{\phi}^{\text{err}}(t, r) = u_{\phi}^0(t, r) - \tilde{u}_{\phi}^{\text{app.1}}(t, r),
\]

\[
\tilde{u}_{\phi}^{\text{err}}(t, r, \phi) = u_{\phi}^0(t, r, \phi) - \tilde{u}_{\phi}^{\text{app.1}}(t, r, \phi),
\]

\[
\tilde{p}^{\text{err}} = p^v(t, r) - \tilde{p}^{\text{app.1}}(t, r).
\]

(4.9)

Then the error solution satisfies the following system

\[
\left(\tilde{u}_{\phi}^{\text{err}}\right)^2 + 2\tilde{u}_{\phi}^{\text{err}}\tilde{u}_{\phi}^{\text{app.1}} - r\partial_r \tilde{p}^{\text{err}} = \hat{A},
\]

\[
\partial_r \tilde{u}_{\phi}^{\text{err}} - \frac{v}{r}\partial_r(r\partial_r\tilde{u}_{\phi}^{\text{err}}) + \frac{v}{r^2}\tilde{u}_{\phi}^{\text{err}} = -\hat{B} - \hat{C} - \hat{G}.
\]
\[
\partial_t \hat{u}_{\text{err}} + \frac{u^v_0}{r} \partial_r \hat{u}_{\text{err}} + \frac{u^v}{r} \partial_\phi \hat{u}_{\text{err}} + \nu \partial_\phi \left( \partial_r (r \partial_r \hat{u}_{\text{err}}) \right) - \frac{\nu}{r^2} \partial_\phi \partial_r \hat{u}_{\text{err}} = -(\hat{D} + \hat{E} + \hat{F} + H), \tag{4.10}
\]

with corresponding boundary and initial conditions
\[
\hat{u}_{\text{err}} \bigg|_{r=1} = 0, \\
\hat{u}_{\text{err}} \bigg|_{t=0} = 0. \tag{4.11}
\]

One can verify that the extra body force terms \( \hat{B}, \ldots, \hat{F} \) are small in the following sense:
\[
\| \hat{B} + \hat{C} + G \|_{L^\infty(0,T;L^2(\Omega))} \leq c \nu, \\
\| \hat{D} + \hat{E} + \hat{F} + H \|_{L^\infty(0,T;L^2(\Omega))} \leq c \nu, \\
\| \hat{B} + \hat{C} + G \|_{L^\infty(0,T;L^\infty(\Omega))} \leq c \nu, \\
\| \hat{D} + \hat{E} + \hat{F} + H \|_{L^\infty(0,T;L^\infty(\Omega))} \leq c \nu. \tag{4.12}
\]

Utilizing the new expansion (4.1) and applying exactly the same technique as in the proof of Theorem 2, we are able to improve the convergence rate of Theorem 2 as follows:

**Theorem 6.** Assume that the initial data \( a(r), b(r, \phi) \) and the boundary data \( (\beta_\phi, \beta_\phi) \) satisfy appropriate high-order compatibility conditions as described in Appendix B. In addition, we assume that \( u^0 \in H^m(\Omega), \beta \in H^2(0,T;H^m(\Omega)), m \geq 9 \). Then we have that
\[
\| u^v - u^0 - \rho(r)(\theta^0 + \sqrt{\nu}\theta^1) \|_{L^\infty(0,T;H^1(\Omega))} \leq O(\nu^{\frac{1}{4}}), \tag{4.13}
\]
\[
\| u^v - u^0 - \rho(r)(\theta^0 + \sqrt{\nu}\theta^1) \|_{L^\infty((0,T) \times \Omega)} \leq O(\nu), \tag{4.14}
\]

where the cut-off function \( \rho(r) \) is defined in Section 2.

**Remark 5.** Estimate (4.14) is sharper than the corresponding result for plane-parallel flows (inequality (6.13) in Theorem 6.1 of [15]), since we employ here the maximum principle instead of the anisotropic Sobolev embedding, and we impose more compatibility and regularity conditions on the data. Therefore we can reach optimal convergence rates in viscosity.

As a corollary, we deduce the following optimal convergence rates for the zeroth-order approximation.

**Corollary 7.** Under the same assumption as Theorem 6, we have
\[
c_3 \nu^{\frac{1}{2}} \leq \| u^v - u^0 - \rho(r)\theta^0 \|_{L^\infty(0,T;H^1)} \leq c_4 \nu^{\frac{1}{2}}, \\
c_5 \nu^{\frac{1}{2}} \leq \| u^v - u^0 - \rho(r)\theta^0 \|_{L^\infty(\Omega \times [0,T])} \leq c_6 \nu^{\frac{1}{2}},
\]

where \( c_3, c_4, c_5 \) and \( c_6 \) are generic constants depending on \( u_0 \) and \( \beta \) but independent of viscosity \( \nu \).

Appendix A. Corrector estimates

In this appendix, we discuss the decay properties and the regularity of the correctors \( \theta^0 \) and \( \theta^1 \) governed by the Prandtl-type equations (2.4) and (4.5) respectively. For this purpose, we introduce the following general Prandtl-type boundary-layer problem for a corrector-like function \( \theta \) over the domain \( \Omega_\infty \):

\[
\frac{\partial}{\partial t} \theta + a(t, Z) \frac{\partial}{\partial Z} \theta - \frac{\partial}{\partial Z} Z \theta = h(t, \phi, Z) \quad \text{in} \quad \Omega_\infty \times [0, T],
\]

\[
\theta|_{Z=0} = 0, \quad \theta|_{Z=\infty} = 0, \quad \theta|_{t=0} = 0,
\]

(A.1)

where \( a(t, Z) \) and \( h(t, \phi, Z) \) are given functions with the following regularity:

\[
\partial^k_t a \in L^\infty(\Omega_\infty \times [0, T]), \quad \langle Z \rangle^l \partial^p_\phi h \in C(0, T; L^2(\Omega_\infty)) \quad \text{for} \quad k + p \leq n, \quad k = 0, 1,
\]

(A.2)

where \( \langle Z \rangle = \sqrt{1 + Z^2}, \) \( l, n, \) and \( m \) are given positive integers.

Moreover, we impose the following compatibility conditions on the data in problem (A.1):

\[
\partial^k_t h(0, \phi, Z) = 0, \quad k = 0, 1.
\]

(A.3)

Then one can modify the approach in Xin and Yanagisawa [33, Theorem 4.1] to obtain the following result.

**Proposition 8.** Assume conditions (A.2)–(A.3) hold. Then the Prandtl-type boundary-layer equation (A.1) has a unique solution such that

\[
\langle Z \rangle^{\alpha_1} \partial^m_\phi \partial^{\alpha_2} \theta \in C(0, T; L^2(\Omega_\infty)), \quad \text{for} \quad \alpha_1 + \left[ \frac{\alpha_2 + 1}{2} \right] \leq n - 1, \quad \alpha_2 \leq 2,
\]

(A.4)

and

\[
\langle Z \rangle^{k} \partial^p_\phi \theta \in C(0, T; L^2(\Omega_\infty)), \quad \text{for} \quad k + p \leq n - 1, \quad k = 0, 1.
\]

(A.5)

In addition,

\[
\partial^k_t \theta(0, \phi, Z) = 0, \quad k = 0, 1.
\]

(A.6)

We now apply Proposition 8 to Eq. (2.4). First, we notice that the \( m \)-th order compatibility conditions (B.2) on the data in Eqs. (1.9)–(1.10) imply the following compatibility conditions on the data in Eq. (2.4):
\[ \frac{\partial_p (\beta - u^0)|_{\tau=1}}{|u^0|_{t=0}} = 0, \quad p = 0, 1, \ldots, [m/2], \]  
\quad (A.7)

where \([z]\) denoted the greatest integer in \(z\). Now, define \( j_\phi = [\beta_0(t) - u^0_\phi(t, 1)]e^{-Z^2} \). Then one finds that \( \theta = \theta^0_\phi - j_\phi \), where \( \theta^0_\phi \) is defined below Eq. (2.2), satisfies Eq. (A.1) with \( a(t, Z) = 0 \) and

\[ h(t, Z) = -[\beta_0'(t) - \partial_t u^0_\phi(t, 1)]e^{-Z^2} + [\beta_0(t) - u^0_\phi(t, 1)](4Z^2 - 2)e^{-Z^2}. \]

It is easy to verify that conditions (A.2)–(A.3) are satisfied with \( p = 0 \) if we assume \( m \geq 4 \). Therefore the conclusion of Proposition 8 holds for \( \theta_1 \). Then it follows that

\[ \langle Z \rangle^j \partial_t^\alpha \theta_1 \in L^\infty ([0, T] \times [0, +\infty)), \quad \alpha = 0, 1, \]

from the interpolation inequality

\[ \|\theta(t, Z)\|_{L^\infty_t (L^\infty(0, +\infty))} \leq K \|\theta\|_{L^2_t (L^2(0, +\infty))}^{\frac{1}{2}} \|\theta\|_{L^2_t (H^1(0, +\infty))}^{\frac{1}{2}}. \]

The lemma below then follows from the definition of \( \theta_1 \) given above.

**Lemma 9.** Under the same conditions as in Proposition 11 with \( m \geq 4 \), \( \theta^0_\phi \in \bigcap_{j=0}^{[m/2]} C^j([0, T]; H^{m-2j}(0, +\infty)) \) and

\[ \langle Z \rangle^j \partial_t^\alpha \theta^0_\phi \in C(0, T; L^2(0, +\infty)), \quad \alpha \leq 2, \quad (A.8) \]

\[ \langle Z \rangle^j \partial_t^\alpha \theta^0_\phi \in L^\infty ([0, T] \times [0, +\infty)), \quad \alpha = 0, 1, \quad (A.9) \]

and

\[ \partial_t^k \theta^0_\phi |_{t=0} = 0, \quad k = 0, 1. \quad (A.10) \]

**Remark 6.** An alternative way of deriving \( L^\infty \) estimate in time and space for \( \theta^0_\phi \) is to use a comparison principle of parabolic equation (see e.g. [15]). In fact, one can show that \( \partial_t \theta^0_\phi \in L^\infty ([0, T] \times [0, +\infty)) \) by the same method. Moreover, by integrating Eq. (A.1) one finds that \( \theta^0_\phi \in L^\infty(0, T; L^1(\Omega_T)) \).

We now similarly define \( j_x = [\beta_x(t, \phi) - u^0_x(t, 1, \phi)]e^{-Z^2} \) and \( \theta_2 = \theta^0_\phi - j_x \), where \( \theta^0_x \) is also defined below Eq. (2.2). Then one easily verifies that \( \theta_2 \) satisfies Eq. (A.1) with

\[ a(t, Z) = \theta^0_\phi + u^0_\phi(t, 1), \quad (A.11) \]

\[ h(t, \phi, Z) = -\theta^0_\phi \partial_\phi u^0_\phi(t, 1, \phi) + [\beta_x(t, \phi) - u^0_x(t, 1, \phi)](4Z^2 - 2)e^{-Z^2} \]

\[ - a[\partial_\phi \beta_x(t, \phi) - \partial_\phi u^0_x(t, 1, \phi)]e^{-Z^2} - [\partial_\phi \beta_x(t, \phi) - \partial_\phi u^0_x(t, 1, \phi)]e^{-Z^2}. \quad (A.12) \]

It follows that \( h \in C^1(0, T; H^{m-2}) \) given the regularity of the data, that of the Euler solution \( u^0 \), and the regularity of \( \theta^0_\phi \), we established above. Therefore conditions (A.2)–(A.3) are satisfied with \( n = m - 2 \) and \( p \leq m - 2 \) by Lemma 9, Remark 6 and compatibility condition (A.7), if we assume \( m \geq 7 \). We thus have the following lemma.
Lemma 10. Under the same condition as Proposition 11 with \( m \geq 7 \), one has

\[
\langle Z \rangle^1 \partial_\phi^\alpha_1 \partial_z^\alpha_2 \theta \in C(0, T; L^2(\Omega_\infty)), \quad \text{for} \ \alpha_1 + \left\lfloor \frac{\alpha_2 + 1}{2} \right\rfloor \leq 4, \ 0 \leq \alpha_2 \leq 2, \quad (A.13)
\]

\[
\langle Z \rangle^1 \partial_\phi^\alpha_1 \partial_z^\alpha_2 \theta^0_x \in L^\infty(\Omega_\infty \times [0, T]), \quad 0 \leq \alpha_1 \leq 2, \ 0 \leq \alpha_2 \leq 1, \quad (A.14)
\]

\[
\langle Z \rangle^1 \partial_t^k \partial_\phi^0 \theta^0_x \in C(0, T; L^2(\Omega_\infty)), \quad \text{for} \ p \leq m - 3, \ k = 0, 1, \quad (A.15)
\]

and

\[
\partial_t^k \theta^0_x|_{t=0} = 0, \quad k = 0, 1. \quad (A.16)
\]

We note that estimate (A.14) follows from (A.13) and the following anisotropic Sobolev embedding result for the domain \( \Omega_\infty \), which can be derived in the same way as Lemma 5

\[
\| \theta \|_{L^\infty(\Omega_\infty)} \leq C(\| \theta \|_{L^2_x}^{\frac{1}{2}} \| \partial_\phi \theta \|_{L^2_x}^{\frac{1}{2}} + \| \partial_z \theta \|_{L^2_x}^{\frac{1}{2}} \| \partial_\phi \theta \|_{L^2_x}^{\frac{1}{2}} + \| \theta \|_{L^2_x}^{\frac{1}{2}} \| \partial_\phi z \theta \|_{L^2_x}^{\frac{1}{2}}). \quad (A.17)
\]

Finally, we notice that conclusions of Lemmas 9 and 10 apply to \( \theta^1_\phi \) and \( \theta^1_x \), as long as we impose \( m \geq 9 \).

Appendix B. Compatibility condition and regularity

To analyze the boundary layer for the pipe flows under consideration, we need to assume that the initial data, boundary conditions and body forcing term in (1.9)–(1.10) satisfy appropriate compatibility conditions so that the viscous solution is sufficiently regular.

Following Xin and Yanagisawa [33] (see also Temam [36]), we define the \( p \)-Cauchy data of (1.9) and (1.10) inductively by

\[
\partial_t^p u^v|_{t=0} = u_0, \\
\partial_t^p u^v|_{t=0} = (v \Delta v \partial_{t}^{p-1} u^v + \partial_{t}^{p-1} F_1)|_{t=0}, \\
\partial_t^p u^v|_{t=0} = \left( -\sum_{s=0}^{p-1} \binom{p-1}{s} \partial_t^s u^v \cdot \nabla v \partial_{t}^{p-1-s} u^v + v \Delta v \partial_{t}^{p-1} u^v + \partial_{t}^{p-1} F_2 \right)|_{t=0}. \quad (B.1)
\]

Then \( \beta, u_0, F = (F_1, F_2) \) are said to satisfy the compatibility condition of order \( m \) for the initial-boundary value problem (1.9)–(1.10) for any \( \nu > 0 \) if

\[
\partial_t^p u^v|_{t=0, r=1} = \partial_t^p \beta|_{t=0}, \quad p = 0, 1, \ldots, m, \ \text{for any} \ \nu > 0. \quad (B.2)
\]

These compatibility conditions prevent the formation of an initial layer in the Navier–Stokes equation (1.8)–(1.9) due to the possible mismatch of the boundary and initial data. The zeroth-order compatibility condition simply takes the form:

\[
a(1) = \beta_\phi(0), \quad b(1, \phi) = \beta_x(0, \phi), \quad (B.3)
\]

and the first-order compatibility conditions are given by:

Please cite this article in press as: D. Han et al., Boundary layer for a class of nonlinear pipe flow, J. Differential Equations (2012), doi:10.1016/j.jde.2012.02.012
\[ \frac{\partial_t \beta_\phi(0)}{} = v(\alpha'(1) + \alpha''(1) - a(1)) + f_1(0, 1), \]
\[ \frac{\partial_t \beta_x(0, \phi)}{} = v(\partial_x b(1, \phi) + \partial_r b(1, \phi) + \partial_{\phi \phi} b(1, \phi)) - a(1)\partial_x b(1, \phi) + f_2(0, 1, \phi). \] (B.4)

We notice that the first-order compatibility condition involves the viscosity \( v \). This undesirable dependence, however, can be eliminated if we impose that \( \partial_t b(1, \phi) + \partial_r b(1, \phi) + \partial_{\phi \phi} b(1, \phi) = 0 \) and \( \partial_t \beta_x(0, \phi) = -a(1)\partial_x b(1, \phi) + f_2(0, 1, \phi) \).

Since we are working in a domain that is periodic in the \( x \) direction, we employ the following Sobolev spaces for \( m \in \mathbb{Z}_+ \):

\[ H^m(Q) = \{ f \in L^2(Q), \quad D^\alpha f \in L^2(Q), \quad |\alpha| \leq m, \]
\[ f \text{ periodic in the } x \text{ direction and the azimuthal direction } \phi \}. \]

We denote the subspace of functions in \( H^m(Q) \) that are constant in \( x \) by \( H^m(\Omega) \). We also use \( H^m(Q) \) to denote \( (H^m(Q))^3 \) for vector functions. Concerning the existence and regularity of the solution \( \mathbf{u}^\nu \) to the initial–boundary value problem (1.9)–(1.10) for fixed \( \nu \), the following result is classical (see [37, p. 219] and [36], for instance).

**Proposition 11.** Let \( \nu > 0 \) be a constant. Let \( m \) be an integer. Suppose the forces and boundary data are smooth, \( \mathbf{F}, \beta \in C^\infty(\overline{\Omega} \times [0, T]) \), and the initial data \( \mathbf{u}_0 \in H^m(\Omega) \) satisfies the compatibility condition of order \( \lfloor m/2 \rfloor \) for the initial–boundary value problem (1.9)–(1.10). Then there exists a unique solution \( \mathbf{u}^\nu \) in the space
\[ \bigcap_{j=0}^{\lfloor m/2 \rfloor} C^j([0, T]; H^{m-2j}(\Omega)). \]

**Remark 7.** The requirement \( \mathbf{F}, \beta \in C^\infty(\overline{\Omega} \times [0, T]) \) is purely for the ease of simplifying notation. In fact, the same conclusion holds under much less regularity on \( \mathbf{F} \) and \( \beta \). We refer to [36] for details.

The solution of (1.12)–(1.13) can be obtained by solving an ordinary differential equation and a transport equation. Therefore the well-posedness of \( \mathbf{u}^0 \) is readily established. For example, if \( \mathbf{u}_0 \in H^m(Q) \), and \( \mathbf{F} \in C(0, T; H^m(Q)) \), then \( \mathbf{u}^0 \in C(0, T; H^m(Q)) \). (See Temam [38] for results concerning the existence of smooth solution to the full Euler equations.) Since we are also working in cylindrical coordinates, we gather the regularity of solutions to the Euler equation in cylindrical coordinates in the following lemma.

**Lemma 12.** Suppose \( \mathbf{u}_0 \in H^m(Q) \), \( \mathbf{F} \in C(0, T; H^m(Q)) \) with \( m \geq 4 \). Then one has, in polar coordinates:
\[ u^0_\phi, \partial_t u^0_\phi, \frac{u^0_\phi}{r}, \left( -\frac{1}{r} \partial_t (r \partial_r u^0_\phi) + \frac{u^0_\phi}{r^2} \right) \in L^\infty([0, T] \times \Omega), \] (B.5)
\[ u^0_x, \partial_t u^0_x, \partial_\phi u^0_x, \partial_{\phi \phi} u^0_x, \left( -\frac{1}{r} \partial_t (r \partial_r u^0_x) + \frac{\partial_{\phi \phi} u^0_x}{r^2} \right) \in L^\infty([0, T] \times \Omega). \] (B.6)

**Proof.** Recall the ansatz (1.11):
\[ \mathbf{u}^0 = u^0_\phi(t, r) \mathbf{e}_\phi + u^0_x(t, r, \phi) \mathbf{e}_x = (-u^0_\phi \sin \phi, u^0_\phi \cos \phi, u^0_x). \] (B.7)

Noticing that \( u^0_\phi \) is independent of variable \( x \), one concludes by Sobolev embedding that
\[ u^0, \nabla u^0, \Delta u^0 \in L^\infty([0, T] \times \Omega). \] (B.8)

Then (B.6) follows directly, given that
It follows from (B.9) that
\[ \partial_t u_0^\phi - \frac{u_0^\phi}{r} \in L^\infty([0, T] \times \Omega) \]
and on the other hand, the addition of (B.10) and (B.11) implies
\[ \partial_t u_0^\phi + \frac{u_0^\phi}{r} \in L^\infty([0, T] \times \Omega). \]
Therefore, one obtains $\partial_t u_0^\phi, \frac{u_0^\phi}{r} \in L^\infty([0, T] \times \Omega)$. \hfill $\Box$
