In this example, I first entered the search term: social engineering.

The results were not so good, so I took advantage of LionSearch suggestions at the bottom of the search window, and shown in Figure 1 below. I clicked on "social engineering threats" and the results greatly improved. However, I suspected I could do better.

As shown in Figure 2, I first refined the search to only include "full text online" results. I did an additional search to additionally restrict results to "journal articles."

With these successive adjustments, I identified more useful references. To continue, I would probably experiment with some of the other recommended terms in Figure 1. Also, each scholarly source includes a useful set of references to investigate. Good detective (and search) skills can greatly improve a literature search!
