Becoming Members of Society:
Learning the Social Meanings
of Gender

HOLLY DEVOR

Gender is the most transparent of all social categories: we acquire gender roles so early in life and so thoroughly that it’s hard to see them as the result of lessons taught and learned. Maleness and femaleness seem “natural,” not the product of socialization. In this wide-ranging scholarly essay, Holly Decor suggests that many of our notions of what it means to be female or male are socially constructed. She also touches on the various ways that different cultures define gender. A professor of sociology at the University of Victoria in British Columbia, Decor (b. 1951) is a member of the International Academy of Sex Research and author of FTM: Female-to-Male Transsexuals in Society (1997). This selection is taken from her groundbreaking book, Gender Blending: Confronting the Limits of Duality (1989).

The Gendered Self

The task of learning to be properly gendered members of society only begins with the establishment of gender identity. Gender identities act as cognitive filtering devices guiding people to attend to and learn gender role behaviors appropriate to their statuses. Learning to behave in accordance with one’s gender identity is a lifelong process. As we move through our lives, society demands different gender performances from us and rewards, tolerates, or punishes us differently for conformity to, or digression from, social norms. As children, and later adults, learn the rules of membership in society, they come to see themselves in terms they have learned from the people around them.

Children begin to settle into a gender identity between the age of eighteen months and two years. By the age of two, children usually understand that they are members of a gender grouping and can correctly identify other members of their gender. By age three they have a fairly firm and consistent concept of gender. Generally, it is not until children are five to seven years old that they become convinced that they are permanent members of their gender grouping.

Researchers test the establishment, depth, and tenacity of gender identity through the use of language and the concepts mediated by language. The language systems used in populations studied by most researchers in this field conceptualize gender as binary and permanent. All persons are either male or female. All males are first boys and then men; all females are first girls and then women. People are believed to be unable to change genders without sex change surgery, and those who do change sex are considered to be both disturbed and exceedingly rare.

This is by no means the only way that gender is conceived in all cultures. Many aboriginal cultures have more than two gender categories and accept the idea that, under certain circumstances, gender may be changed without changes being made to biological sex characteristics. Many North and South American native peoples had a legitimate social category for persons who wished to live according to the gender role of another sex. Such people were sometimes revered, sometimes ignored, and occasionally scorned. Each culture had its own word to describe such persons, most commonly translated into English as “herdache.” Similar institutions and linguistic concepts have also been recorded in early Siberian, Madagascan, and Polynesian societies, as well as in medieval Europe.

Very young children learn their culture’s social definitions of gender and gender identity at the same time that they learn what gender behaviors are appropriate for them. But they only gradually come to understand the meaning of gender in the same way as the adults of their society do. Very young children may learn the words which describe their gender and be able to apply them to themselves appropriately, but their comprehension of their meaning is often different from that used by adults. Five-year-olds, for example, may be able to accurately recognize their own gender and the genders of the people around them, but they will often make such ascriptions on the basis of role information, such as hair style, rather than physical

attributes, such as genitals, even when physical cues are clearly known to them. One result of this level of understanding of gender is that children in this age group often believe that people may change their gender with a change in clothing, hair style, or activity.5

The characteristics most salient to young minds are the more culturally specific qualities which grow out of gender role prescriptions. In one study, young school age children, who were given dolls and asked to identify their gender, overwhelmingly identified the gender of the dolls on the basis of attributes such as hair length or clothing style, in spite of the fact that the dolls were anatomically correct. Only 17 percent of the children identified the dolls on the basis of their primary or secondary sex characteristics.6 Children five to seven years old understand gender as a function of role rather than as a function of anatomy. Their understanding is that gender (role) is supposed to be stable but that it is possible to alter it at will. This demonstrates that although the standard social definition of gender is based on genitalia, this is not the way that young children first learn to distinguish gender. The process of learning to think about gender in an adult fashion is one prerequisite to becoming a full member of society. Thus, as children grow older, they learn to think of themselves and others in terms more like those used by adults.

Children's developing concepts of themselves as individuals are necessarily bound up in their need to understand the expectations of the society of which they are a part. As they develop concepts of themselves as individuals, they do so while observing themselves as reflected in the eyes of others. Children start to understand themselves as individuals separate from others during the years that they first acquire gender identities and gender roles. As they do so, they begin to understand that others see them and respond to them as particular people. In this way they develop concepts of themselves as individuals, as an "I" (a proactive subject) simultaneous with self-images of themselves as individuals, as a "me" (a member of society, a subjective object). Children learn that they are both as they see themselves and as others see them.7

To some extent, children initially acquire the values of the society around them almost indiscriminately. To the degree that children absorb the generalized standards of society into their personal concept of what is correct behavior, they can be said to hold within themselves the attitude of the "generalized other." This "generalized other" functions as a sort of monitoring or measuring device with which individuals may judge their own actions against those of their generalized conceptions of how members of society are expected to act. In this way members of society have available to them a guide, or an internalized observer, to turn the more private "I" into the object of public scrutiny, the "me." In this way, people can monitor their own behavioral impulses and censor actions which might earn them social disapproval or scorn. The tension created by the constant interplay of the personal "I" and the social "me" is the creature known as the "self."8

But not all others are of equal significance in our lives, and therefore not all others are of equal impact on the development of the self. Any person is available to become part of one's "generalized other," but certain individuals, by virtue of the sheer volume of time spent in interaction with someone, or by virtue of the nature of particular interactions, become more significant in the shaping of people's values. These "significant others" become prominent in the formation of one's self-image and one's ideals and goals. As such they carry disproportionate weight in one's personal "generalized other."9 Thus, children's individualistic impulses are shaped into a socially acceptable form both by particular individuals and by a more generalized pressure to conformity exerted by innumerable faceless members of society. Gender identity is one of the most central portions of that developing sense of self...

Gender Role Behaviors and Attitudes

The clusters of social definitions used to identify persons by gender are collectively known as femininity and masculinity. Masculine characteristics are used to identify persons as males, while feminine ones are used as signifiers for femininity. People use femininity or masculinity to claim and communicate their membership in their assigned, or chosen, sex or gender. Others recognize our sex or gender more on the basis of these characteristics than on the basis of sex characteristics, which are usually largely covered by clothing in daily life.

These two clusters of attributes are most commonly seen as mirror images of one another with masculinity usually characterized by dominance and aggression, and femininity by passivity and submission. A more even-handed description of the social qualities subsumed by femininity and masculinity might be to label masculinity as generally concerned with egoistic dominance and femininity as striving for cooperation or communion.10 Characterizing femininity and masculinity in such a way does not portray the two clusters of characteristics as being in a hierarchical relationship to...

5Maccoby, p. 255.
6Ibid., p. 227.
8G. H. Mead.
10Egoistic dominance is a striving for superior rewards for oneself or a competitive striving to reduce the rewards for one's competitors even if such action will not increase one's own rewards. Persons who are motivated by desires for egoistic dominance not only wish the best for themselves but also wish to diminish the advantages of others whom they may perceive as competing with them. See Maccoby, p. 217.
one another but rather as being two different approaches to the same question, that question being centrally concerned with the goals, means, and use of power. Such an alternative conception of gender roles captures the hierarchical and competitive masculine thirst for power, which can, but need not, lead to aggression, and the feminine quest for harmony and communal well-being, which can, but need not, result in passivity and dependence.

Many activities and modes of expression are recognized by most members of society as feminine. Any of these can be, and often are, displayed by persons of either gender. In some cases, cross-gender behaviors are ignored by observers, and therefore do not compromise the integrity of a person’s gender display. In other cases, they are labeled as inappropriate gender role behaviors. Although these behaviors are closely linked to sexual status in the minds and experiences of most people, research shows that dominant persons of either gender tend to use influence tactics and verbal styles usually associated with men and masculinity, while subordinate persons, of either gender, tend to use those considered to be the province of women. Thus it seems likely that many aspects of masculinity and femininity are the result, rather than the cause, of status inequalities.

Popular conceptions of femininity and masculinity instead revolve around hierarchical appraisals of the “natural” roles of males and females. Members of both genders are believed to share many of the same human characteristics, although in different relative proportions; both males and females are popularly thought to be able to do many of the same things, but most activities are divided into suitable and unsuitable categories for each gender class. Persons who perform the activities considered appropriate for another gender will be expected to perform them poorly; if they succeed adequately, or even well, at their endeavors, they may be rewarded with ridicule or scorn for blurring the gender dividing line.

The patriarchal gender schema currently in use in mainstream North American society reserves highly valued attributes for males and actively supports the high evaluation of any characteristics which might inadvertently become associated with maleness. The ideology which the schema grows out of postulates that the cultural superiority of males is a natural outgrowth of the innate predisposition of males toward aggression and dominance, which is assumed to flow inevitably from evolutionary and biological sources. Female attributes are likewise postulated to find their source in innate predispositions acquired in the evolution of the species. Feminine characteristics are thought to be intrinsic to the female facility for childbirth and breastfeeding. Hence, it is popularly believed that the social position of females is biologically mandated to be intertwined with the care of children and a “natural” dependency on men for the maintenance of mother-child units. Thus the goals of femininity and, by implication, all biological females are presumed to revolve around heterosexuality and maternity.35

Femininity, according to this traditional formulation, would result in warm and continued relationships with men, a sense of maternity, interest in caring for children, and the capacity to work productively and continuously in female occupations.34 This recipe translates into a vast number of proscriptions and prescriptions. Warm and continued relations with men and an interest in maternity require that females be heterosexually oriented. A heterosexual orientation requires women to dress, move, speak, and act in ways that men will find attractive. As patriarchy has reserved active expressions of power as a masculine attribute, femininity must be expressed through modes of dress, movement, speech, and action which communicate weakness, dependency, ineffectualness, availability for sexual or emotional service, and sensitivity to the needs of others.

Some, but not all, of these modes of interrelation also serve the demands of maternity and many female job ghetos. In many cases, though, femininity is not particularly useful in maternity or employment. Both mothers and workers often need to be strong, independent, and effectual in order to do their jobs well. Thus femininity, as a role, is best suited to satisfying a masculine vision of heterosexual attractiveness.

Body postures and demeanors which communicate subordinate status and vulnerability to trespass through a message of “no threat” make people appear to be feminine. They demonstrate subordination through a minimizing of spatial use; people appear feminine when they keep their arms closer to their bodies, their legs closer together, and their torsos and heads less vertical than do masculine-looking individuals. People also look feminine when they point their toes inward and use their hands in small or childlike gestures. Other people also tend to stand closer to people they see as feminine, often invading their personal space, while people who make frequent appeasement gestures, such as smiling, also give the appearance of femininity. Perhaps as an outgrowth of a subordinate status and the need to avoid conflict with more socially powerful people, women tend to excel over men at the ability to correctly interpret, and effectively display, nonverbal communication cues.35

34Scheme: A mental framework, scheme, or pattern that helps us make sense of experience.
Speech characterized by inflections, intonations, and phrases that convey nonaggression and subordinate status also make a speaker appear more feminine. Subordinate speakers who use more polite expressions and ask more questions in conversation seem more feminine. Speech characterized by sounds of higher frequencies are often interpreted by listeners as feminine, childlike, and ineffective. 16 Feminine styles of dress likewise display subordinate status through greater restriction of the free movement of the body, greater exposure of the bare skin, and an emphasis on sexual characteristics. The more gender distinct the dress, the more this is the case.

Masculinity, like femininity, can be demonstrated through a wide variety of cues. Fleck has argued that it is commonly expressed in North American society through the attainment of some level of proficiency at some, or all, of the following four main attitudes of masculinity. Persons who display success and high status in their social group, who exhibit “a manly air of toughness, confidence, and self-reliance” and “the aura of aggression, violence, and daring,” and who conscientiously avoid anything associated with femininity, are seen as exuding masculinity. 17 These requirements reflect the patriarchal ideology that masculinity results from an excess of testosterone, the assumption being that androgens supply a natural impetus toward aggression, which, in turn, impels males toward achievement and success. This vision of masculinity also reflects the ideological stance that ideal maleness (masculinity) must remain untainted by female (feminine) pollutants.

Masculinity, then, requires of its actors that they organize themselves and their society in a hierarchical manner so as to be able to explicitly quantify the achievement of success. The achievement of high status in one’s social group requires competitive and aggressive behavior from those who wish to obtain it. Competition is motivated by a goal of individual achievement, or egoistic dominance, also requires of its participants a degree of emotional insensitivity to feelings of hurt and loss in defeated others, and a measure of emotional insularity to protect oneself from becoming vulnerable to manipulation by others. Such values lead those who subscribe to them to view feminine persons as “losers” and to strive to eliminate anyone similarities to feminine people from their own personalities. In patriarchal organized societies, masculine values become the ideological structure of the society as a whole. Masculinity thus becomes “inately” valuable and femininity serves a contrapuntal function to delineate and magnify the hierarchical dominance of masculinity.

Body postures, speech patterns, and styles of dress which demonstrate and support the assumption of dominance and authority convey an impression of masculinity. Typical masculine body postures tend to be expansive and aggressive. People who hold their arms and hands in positions away from their bodies, and who stand, sit, or lie with their legs apart—thus maximizing the amount of space that they physically occupy—appear more physically masculine. Persons who communicate an air of authority or a readiness for aggression by standing erect and moving forcefully also tend to appear more masculine. Movements that are abrupt and stiff, communicating force and threat rather than flexibility and cooperation, make an actor look masculine. Masculinity can also be conveyed by stern or serious facial expressions that suggest minimal receptivity to the influence of others, a characteristic which is an important element in the attainment and maintenance of egotistic dominance. 20

Speech and dress which likewise demonstrate or claim superior status are also seen as characteristically masculine behavior patterns. Masculine speech patterns display a tendency toward expansiveness similar to that found in masculine body postures. People who attempt to control the direction of conversations seem more masculine. 21 Those who tend to speak more loudly, use less polite and more assertive forms, and tend to interrupt the conversations of others more often also communicate masculinity to others. Styles of dress which emphasize the size of upper body musculature, allow freedom of movement, and encourage an illusion of physical power and a look of easy physicality all suggest masculinity. Such appearances of strength and readiness to action serve to create or enhance an aura of aggressiveness and intimidation central to an appearance of masculinity. Expansive postures and gestures combine with these qualities to insinuate that a position of secure dominance is a masculine one.

Gender role characteristics reflect the ideological contents underlying the dominant gender schema in North American society. That schema leads us to believe that female and male behaviors are the result of socially directed hormonal instructions which specify that females will want to have children and will therefore find themselves relatively helpless and dependent on males for support and protection. The schema claims that males are innately aggressive and competitive and therefore will dominate over females. The social hegemony 22 of this ideology ensures that we are all raised to practice gender roles which will confirm this vision of the nature of the sexes. Fortunately, our training to gender roles is neither complete nor uniform. As a result, it is possible to point to multitudinous exceptions to, and variations on, these themes. Biological evidence is equivocal about the source of gender roles; psychological androgyne 23 is a widely accepted concept. It seems most likely that gender roles are the result of systematic power imbalances based on gender discrimination. 24
ENGAGING THE TEXT

1. Devor charges that most languages present gender as "binary and permanent" (para. 3). Has this been your own view? How does Devor challenge this idea—that is, what's the alternative to gender being binary and permanent—and how persuasive do you find her evidence?

2. How, according to Devor, do children "acquire" gender roles? What are the functions of the "generalized other" and the "significant other" in this process?

3. Explain the distinction Devor makes between the "I" and the "me" (paras. 7 and 8). Write a journal entry describing some of the differences between your own "I" and "me."

4. Using examples from Devor and from other reading or observation, list some "activities and modes of expression" (para. 12) that society considers characteristically female and characteristically male. Which are acceptable crossgender behaviors, and which are not? Search for a "rule" that defines what types of crossgender behaviors are tolerated.

5. Do some aspects of the traditional gender roles described by Devor seem to be changing? If so, which ones, and how?

EXPLORING CONNECTIONS

7. To what extent do Tocqueville's views of women and men (p. 407) reflect the "patriarchal gender schema" as Devor defines it?

8. Drawing on Devor's discussion of gender role formation, analyze the difference between the "I" and the "me" of the girl in Jamaica Kincaid's story (p. 411).

9. How would Devor explain the humor of the cartoon on page 422? How do the details of the cartoon—the setting, the woman's appearance, the three pictures on the coffee table—contribute to its effect?

EXTENDING THE CRITICAL CONTEXT

10. As a class, identify at least half a dozen men living today who are widely admired in American culture. To what extent do they embody the "four main attitudes of masculinity" outlined by Devor (para. 19)?

11. Write an essay or journal entry analyzing your own gender role socialization. To what extent have you been pressured to conform to conventional roles? To what extent have you resisted them? What roles have "generalized others" and "significant others" played in shaping your identity?

The Story of My Body

JUDITH ORTIZ COFER

Accepting the idea that gender roles are socially constructed might not be too difficult, but it may come as a shock to realize that even the way we see our bodies is filtered through the lens of social values and beliefs. In this personal essay, Judith Ortiz Cofer reflects on the different roles her own body has assumed in different contexts and cultures—the ways that different societies have "read" the meanings of her physical appearance. The story of her body becomes, to some extent, the story of her life, and woven into the tale are intriguing comments on gender and on cross-cultural perception. A native of Puerto Rico, Ortiz Cofer (b. 1952) is a professor of English and creative writing at the University of Georgia. Her publications include The Line of the Sun (1989), a novel; Silent Dancing (1990), a collection of poetry and prose; and The Latin Deli (1993), in which "The Story of My
