I wish to obtain a position in the area of nuclear engineering. Currently I am working on a pre-major requirement for nuclear engineering at the Pennsylvania State University. My targeted GPA at the end of my college years would be a 3.00, or higher, from a total of 4.00.

My current major is nuclear engineering with a possible minor in either physics or system management. Some of my skills would be my ability to work well in groups and essentially become an important part of the group dynamics. I am also skilled when it comes to working with mathematics and science. I can also be very creative when it comes to coming up with ideas on how to solve intricate problems. Furthermore, I am tri-lingual and I am able to play the trumpet.

Some of my activities that I have held a leadership role would be in a special needs program created at my school. I was one of leaders when it came to spending time with children who have special needs. I also helped create activities for them to participate in and have fun at the same time. Overall, I was very successful when I was in that program because peers would always be commenting on the amazing things that I was able to do for those children. Another place where I held a leadership position would be in a sports and entertainment marketing competition group. My group had a task that needed to be completed, it involved being able to get people to come to a benefit concert for people who have Down syndrome. For nearly a month I was supervising every aspect that involved the project. I gave suggestions to the team members on how to improve certain aspects. Lastly, I led on how it would all come together for the final product and presentation. In the end my group beat out 5 other groups because of how well everything was put and presented in the end.
