## Basketball Hoop

I chose a basketball hoop for my personal project because basketball is my passion and I have been playing the sport since I was a toddler.

The most difficult part of this project was definitely the sweeping of the rim and finding a way to make a net. If it was available, I would've used a different type of pattern that would resemble an actual net more correctly because the pattern I'm using now does not exactly have a pattern of a net. This object relates to my hobbies because throughout elementary, middle, and high school, whenever I had free time I would go outside either with a couple of my friends or by myself, I would play for a couple of hours at a time. Throughout this project, I applied all the lessons I had learned throughout the year via the tutorials, to this project. A lesson that I learned from doing this project was that even objects that at first seems simple, can be quite complicated because of small details that usually gets overlooked. This project was a lot of fun, I get to create an object that I had passion about, so it made time fly by when I was creating this object.
