**CAD Project**

For this project, I decided to make a scissor. I chose this item because I knew it would be a challenge. I did not want to choose an item that I knew would be very easy and not teach me new things in the process. This specific object, the scissor, would force me to learn new techniques and new tools that I had not previously used. Because I had not learned these skills previously, this specific product was a challenge. My motivation to do this, was not to come out with a really good grade, but to really take away and learn something from this project. To further my learning with solidworks. Not to reuse the same skills I already know to make a simple object. This project truly assessed my abilities, and shows where I lack, and what is still left to learn. But it has also showed me that there are easier and more efficient ways to do things on solidworks.

The main goal for me, was to learn more than I already knew. And the only way to do that was by choosing an item that I knew would certainly do so. This product relates to my hobbies because I am love arts and crafts. I am always using scissors to cut paper, open things, twirl string, and all sorts of uses. This project in and of itself is linked towards my intended major because I will be using solidworks in my major, and that was the main tool used in this project. This project increased my knowledge with solidworks and the pace at which I work. It is certainly not perfection, but practicing and trying new things will always make you better.
