Our mission is to repurpose broken or otherwise unusable refectory bricks into a product or system that can increase the profits of ArcelorMittal while reducing waste output. The product or system must not pose any public safety issues. It should require very little to no other inputs to create and the process of creation should not produce waste itself. It must be an efficient self-contained system. We propose that ArcelorMittal should repurpose the waste refractory bricks to build roads at their mining sites. The bricks should be used to enhance the road bed so that the road lasts longer and is less susceptible to pot holes and wash outs. Our primary market is ArcelorMittal
