PSU PROJECT: Henderson Addition – Biobehavioral Health Building
DGS PROJECT NO.: 800-290
PSU PROJECT NO.: 06-42744
LOCATED AT: The Pennsylvania State University
University Park Campus
University Park, Centre County, Pennsylvania

2. SEALED PROPOSALS will be received by the Owner at: The Pennsylvania State University, Physical Plant Design & Construction Division, Room 106, Physical Plant Building, University Park, Pennsylvania, 16802. All bids are due by 3pm sharp on the BID DATE specified. Bids will be received from 8AM to 3PM sharp on the BID DATE specified. The Bid opening is open to the public and bids will be opened shortly after 3PM in Room 214 of the PSU Physical Plant (OPP) Building. [C]

BID DATE: Various – See above
BRIDGE BUILDING ABATEMENT COMPLETION DATE: December 24, 2010
BRIDGE BUILDING DEMOLITION COMPLETION DATE: January 13, 2011
SUBSTANTIAL COMPLETION DATE: October 19, 2012
FINAL COMPLETION DATE (completion of all punch list items): November 14, 2012

Refer to Section H2 for preliminary schedule and activity durations.
3. PREBID CONFERENCE: A Prebid Conference will be held in accordance with the following schedule: all stated times are Prevailing Time,

<table>
<thead>

</tbody>
</table>

In the Heritage Hall of the Hetzel Union Building (HUB), University Park Campus, University Park, Pennsylvania. All prime contract bidders are required to attend the same Prebid Conference which starts at 9:00 AM. Doors open at 8:00 AM. There will be a brief walk through of the existing bridge building as well as access to the steam tunnel which runs through the project site. This walk through will commence following the Prebid Conference.

4. BIDDING DOCUMENTS. Plans and specifications are available for purchase through the Washington Reprographics Online Plan Room. Please contact Tim Jones (tjones@massarocms.com, 412-963-2800 x260) at Massaro CM Services to become a registered user. Drawings, specifications, supplemental Prebid documents and communication will be issued via email through the Online Plan Room to registered users. Bidding documents will also be available for review in room 106, Physical Plant Building, University Park, PA. There is no cost associated with becoming a user of the Online Plan Room.

Bidders shall use complete set of Bidding Documents in preparing Bids; neither the Owner nor Architect assumes responsibility for errors or misinterpretations resulting from the use of incomplete sets of Bidding Documents. All bidders are advised that they are responsible to obtain adequate bidding documents to determine all conditions affecting their work.

5. PREQUALIFICATION. All contractors bidding the prime contracts are required to complete a Massaro pre-qualification form and submit it to Massaro by October 4, 2010. The form is available in Section H7. In addition, all contractors bidding on the Abatement, Demolition and Telecommunications prime contracts or bidding on the Building Automated Systems scope of work included in the HVAC prime contract will need to be pre-qualified through BOTH Massaro and The Pennsylvania State University. The PSU pre-qualification form can be found on the Office of Physical Plant website at www.opp.psu.edu. The PSU pre-qualification process takes approximately 2 weeks.

6. BID GUARANTY. A Bid Guaranty in the form of a Certified Check or a Surety Company’s Bid Bond shall be submitted with the Proposal in an amount of not less than five percent (5%) of the total Bid amount.

In the event that any Bidders shall, upon the award of a contract, fail to comply with terms of the Proposal and/or Contract Documents, the amount of the Bid Guaranty shall be forfeited to the Owner.

7. PERFORMANCE AND PAYMENT BONDS. The Contractor, at the time of execution of the Agreement, shall furnish, at its own cost and expense, Performance and Payment Bonds covering the faithful performance of the Contract and the payment of all obligations arising therefrom, each in the full Contract amount and in such form as the Owner may prescribe.
8. THE FORM OF PROPOSAL must be delivered in a sealed envelope, all blanks fully filled in, **ALL PRICES BEING INDICATED IN WORDS**, as also in figures, and the complete form without interlineation, alteration or erasures, and executed by the proper person or persons authorized to sign for the firm, corporation, or individual Bidder.

The sealed bid envelope shall be addressed to:

The Pennsylvania State University

Physical Plant Design & Construction Division

Room 106, Physical Plant Building

University Park, Pennsylvania 16802

The Bid envelope, at lower left corner, shall bear the following identifying notation:

Bid For: [State the Contract Type and Number]

Project: [State the Project Title]

Project No.: [State the Project Number]

Bid Date: [State the Bid Date]

Submitted by: [State the Bidder’s Name]

Proposals which do not conform to these requirements, or which contain additions, conditional bids, or irregularities of any kind, may be rejected.

9. MODIFICATIONS OF BIDS. Any Bidder may modify its bid by telegraphic communication (fax #814-865-1692) at any time prior to the scheduled closing time for receipt of bids, provided such telegraphic communication is received by the Owner prior to the closing time, and provided further, that the Owner is satisfied that a written confirmation of the telegraphic modification over the signature of the Bidder was mailed prior to the closing time.

The telegraphic modification communication must not reveal the Bid Price but should provide the addition or subtraction or other modification so that the final prices or terms will not be known by the Owner until the Sealed Bid is opened. If written confirmation is not received within two (2) days from the closing time, no consideration will be given to the telegraphic modification.

10. BID SUBMITTAL. Any bid submitted may be withdrawn prior to the scheduled time for opening or authorized postponement thereof.

Regardless of the method used for delivery of bids to Room 106 of the Physical Plant (OPP) Building, it is strictly the responsibility of the submitting contractor to insure the bid is submitted by 3PM sharp. No bid will be accepted after 3pm. [C]

**ANY BID RECEIVED AFTER THE TIME AND DATE SPECIFIED WILL NOT BE CONSIDERED.**

No Bidder may withdraw a bid within sixty (60) days after the actual opening thereof.
BEFORE SUBMITTING A PROPOSAL, The Bidder should CAREFULLY EXAMINE ALL of the Drawings, Schedules, and Specifications, VISIT THE SITE, fully inform itself as to all laws, ordinances, regulations, wage rates, and labor conditions in the area of operation affecting the Contract or the work, and shall include in his proposal a sum to cover the cost of all items, implied or required, to attain the completed conditions contemplated by the Contract Documents.

THE OWNER DOES NOT OBLIGATE ITSELF to accept the lowest proposal or any proposal, and reserves the right to waive any informalities in any or all bids, and to reject or accept any proposal.

11. BIDDERS SHALL AGREE, if awarded the contract for the work, to execute a separate agreement for the work proposed. The Agreement, as a Lump Sum Contract, shall be executed on the standard Form of Agreement DGS 1-C bound (sample) with the Contract Documents.

BIDDERS SHALL AGREE, if awarded the Contract, to commence work at the site within ten (10) days after date of “Notice to Proceed,” and to complete the entire work on or before the Completion Date stipulated hereinbefore.

12. TIME OF COMPLETION – LIQUIDATED DAMAGES. Contractor must agree to begin work contemplated by this contract within ten (10) days after the date specified in the Notice to Proceed as the starting date and to complete the work on or before the completion dates indicated in section A, item #2 subject to extension of Contract time as provided in Article 10 of the General Conditions. Contractor must agree to pay to the Owner as liquidated damages and not as a penalty, the sum of five hundred dollars ($500.00) per calendar day for each calendar day of delay. The Contractor and its surety shall be liable for the amount thereof.

The basis for liquidated damages for the Abatement contract (#800-290.HA1.1) and the Demolition contract (#800-290.BD2.1) will be the completion dates indicated in Section A, item #2 above. For all other contracts the basis for liquidated damages will be based on the substantial completion date listed in Section A, item #2 above as well as the master project schedule including the 2 week look ahead updates. The project schedule process is outlined further in Section F.

13. Local Building Permit costs shall not be included in the Contract Amount. PSU will provide the required building permits.

14. TO VISIT THE SITE, due to the ongoing operations of the Henderson Building, the University is limiting Prebid site visits to the walkthrough scheduled to commence following the Prebid Conference as described in item #3 above.

15. PREBID REQUESTS FOR INFORMATION: In the case that the Bidder finds discrepancies or omissions in, or is in doubt as to the meaning of the drawings or contract documents, the Bidder shall at once make inquiry to the Construction Manager, who will send answers in the form of Addenda to all Bidders via the Online Plan Room. The RFI form will be available for download on the Online Plan Room and is the required form for all Prebid RFI’s. Information requests not on this form may not be addressed.

All correspondence shall be directed to:

Brian Frye
bfrye@massarocorporation.com

To receive attention, such inquiries must be received by Massaro CM Services, LLC no later than noon ten (10) days prior to the Bid Date.
16. **EQUAL EMPLOYMENT OPPORTUNITY AND REFERRAL TO NON-DISCRIMINATION CLAUSE**

In performing the work or making or furnishing any article required by this Contract, the Contractor shall comply with all provisions of Executive Order No. 11246 of September 24, 1965, as amended by Executive Order No. 11375 of October 13, 1967, and all subsequent rules, regulations, and relevant orders of the Secretary of Labor. The Contractor will comply with all provisions of Executive Order 1972-1 or any regulations issued by the Pennsylvania Human Relations Commission, 16 Pa. Code, Chapter 49. The Non-Discrimination Clause as issued by the Pennsylvania Human Relations Commission is attached as Article 13 of the General Conditions of the Contract.

17. **PREVAILING WAGE ACT**

This project is subject to the Pennsylvania Prevailing Wage Act, Act NO. 442, August 15, 1961 (P.L. 987), as amended August 9, 1963, Act No. 342. All Contractors and Subcontractors shall comply with all requirements of this Act. Refer to Sections D and D1 of this specification for additional information.

18. **STEEL PRODUCTS PROCUREMENT ACT**

   a. This Project is subject to the provisions of the Steel Products Procurement Act of 1978 (P.L. 6, No. 3) as amended by the Act of July 9, 1984 (P.L. 674, No. 144). All Contractors, Subcontractors, and Material Suppliers shall be required to comply with all provisions of this Act.

   b. The Contractor shall be required to provide with each Application-Certificate of Payment form an executed copy of the Certification of Compliance with the Steel Products Procurement Act form and additional documentation, including but not limited to, invoices, bills of lading, mill certifications, or other acceptable evidence that the steel products represented on the payment application comply with one or more of the following categories:

      1. That the steel utilized on this project was melted and manufactured in the United States; and/or

      2. The product contains both foreign and United States steel, and at least seventy-five percent (75%) of the cost of all of the articles, materials, and supplies incorporated in the product have been mined, produced, or manufactured, as the case may be, in the United States; and/or

      3. The steel product is not produced in the United States in sufficient quantities to meet the requirements of the contract, and prior written approval to use foreign steel has been obtained from The Pennsylvania State University.

   c. Any nonconforming steel products incorporated into the work shall be removed and replaced by the Contractor, at its own expense, with products meeting the requirements of the Act.

   d. Willful violation of this Act can result in penalties, including (but not necessarily limited to) prohibition from submitting any bids, or performing any work, or supplying any materials to a public agency for a period five (5) years from the date of the determination that a violation has occurred.

19. All work relating to this project shall be subject to all federal, state and local codes, ordinances and regulations regarding occupational safety and health, environmental protection and construction standards. Nothing contained in the specifications or the drawings shall be construed to conflict with such laws, codes, ordinances or regulations, and in the event of such conflict any requirement imposed by law, ordinance or regulation shall be deemed controlling.
20. LEAD-FREE PLUMBING CERTIFICATION. The Contractor shall provide a certification that all plumbing materials are lead-free and meet the requirements of the Pennsylvania Plumbing and Lead Ban Notification Act. This certification shall be signed by the Contractor, notarized and submitted to the University before the water service turn-on.

21. MINORITY AND WOMEN BUSINESS ENTERPRISES. Refer to Exhibit I for specific MBE/WBE participation levels. Minority participation and/or solicitation is required for the bid to be considered responsive. MBE/WBE Certification/Participation Forms 16A and 16B contained in Section B “Form of Proposal” must be completed and included with the bid documents. Any questions on completing the required paperwork should be addressed to Mr. Vernon L. Davis, Contractor Liaison, at (814) 863-2520 or vld3@psu.edu.

Each Prime Contractor will be required to include with all Applications for Payment, a form (developed by MCMS) documenting MBE/WBE participation levels. This form will be reviewed as part of the payment application process by MCMS and PSU to verify MBE/WBE required participation levels are being achieved and maintained.

22. CONTRACTOR RESPONSIBILITY. Exhibit D “Tax Liability Provisions” provides information pertaining to the Commonwealth of Pennsylvania Department of General Services certification. This certification process requires each bidder to have a Vendor ID. A Vendor ID may be obtained through the following web link titled “Central Vendor Management Unit (CVMU)”.

http://www.vendorregistration.state.pa.us/cvmu/paper/default.aspx
Click on the “Procurement Vendor Registration Form” to complete the registration process.

GSMWBE-16 (8/04)

MBE/WBE SUBCONTRACTOR AND SUPPLIER CERTIFICATION, 
SOLICITATION AND COMMITMENT FORM

This form, GSMWBE-16 (Form 16), is comprised of two parts: 16A - Certification and 16B - Record of MBE/WBE Solicitations and Commitments. Instructions on how to complete both parts of this form are provided at the end of this document.

FORM 16A – CERTIFICATION

This Form 16A must be completed and signed by the each bidder and submitted with its bid.

Bidder name: ____________________________________________

Project #: ____________________________________________

☐ 1. We commit to meet the MPLs for the project as stated in the Notice to Bidders for:
   MBEs Yes ___  No ___
   WBEs Yes ___  No ___

If the answer for both MBEs and WBEs is "Yes" GO DIRECTLY TO THE SIGNATURE LINES AT THE END OF THIS CERTIFICATION. YOU DO NOT NEED TO COMPLETE THE REMAINDER OF THIS FORM AND YOU DO NOT NEED TO COMPLETE FORM 16B.

If either answer is "No" you must check and complete either statement 2 or 3 below, sign this form and complete Form 16B.

☐ 2. We do not commit to meet both MPLs as stated in the Notice to Bidders. However, we did meet the minimum solicitation requirements (5 MBE subcontractors and 5 WBE subcontractors from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBE suppliers and 5 WBE suppliers) and we commit to the following participation levels:
   MBEs _____ %  WBEs _____ %

☐ We have included below an explanation of our failure to commit to both MPLs. (Attach additional sheets as necessary.)

   MBE: ____________________________________________
   WBE: ____________________________________________

☐ We have completed and included with our bid the Form 16B - Record of MBE/WBE Solicitations and Commitments.

☐ We included with our bid all additional documentation as required in the Form 16 - Instructions and the Instructions to Bidders Section A.31.

☐ We conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.

Failure to check all boxes under this statement 2, to indicate the MBE/WBE participation levels, and to provide a satisfactory explanation shall result in the rejection of your bid as not responsive.
Commonwealth of Pennsylvania
Department of General Services
GSMWBE-16 (8/04)

☐ 3. We do not commit to meet both MPLs as stated in the Notice to Bidders and we did not meet the minimum solicitation requirements (5 MBE subcontractors and 5 WBE subcontractors from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBE suppliers and 5 WBE suppliers); however, we do commit to the following participation levels:

  MBEs _____ %  WBEs _____ %

☐ We have included below an explanation of our failure to commit to both MPLs. (Attach additional sheets as necessary.)

  MBE: ____________________________________________

  WBE: ____________________________________________

☐ We have included below an explanation for our failure to comply with the minimum solicitation requirements. For example, if you do not intend to use any subcontractors you may state that fact as your reason for noncompliance. Complete as many as are appropriate. (Attach additional sheets as necessary.)

  MBE suppliers ________________________________________

  WBE suppliers ________________________________________

☐ To the extent that we have solicited MBEs and WBEs, we have completed and included with our bid the Form 16B - Record of MBE/WBE Solicitations and Commitments.

☐ We have included with our bid all additional documentation as required in the Form 16 - Instructions and the Instructions to Bidders Section A.31.

☐ We conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.

Failure to check all boxes under this statement 3, to indicate the MBE/WBE participation levels, and to provide satisfactory explanations shall result in the rejection of your bid as not responsive.

**Signature Certification**

I certify that the information on this form is true and correct to the best of my knowledge and that I am authorized to represent the above-named Bidder in connection with this certification.

Signature: ____________________________________________

**Note to Bidders:**

In completing this form, the Bidder must comply with the Form 16 - Instructions and the Instruction for Bidders Section A.31. The following is provided for informational purposes only.

1. If you commit in your bid to meet the MPLs for both MBEs and WBEs you do **not** need to complete this Form 16B.
2. If you do not commit in your bid to meet both MPLs you must complete this Form 16B and submit all additional documentation as required by the Instruction to Bidders Section A.31 and as described in the Form 16 - Instructions. Failure to do so will be sufficient cause for rejection of the bid as NOT RESPONSIVE.
3. In completing Form 16B, the Bidder shall (see Form 16 - Instructions and Instructions to Bidders Section A.31 for complete detail):
   a. solicit a **minimum** of 5 Subcontractors-MBE, 5 Subcontractors-WBE, 5 Suppliers-MBE **and** 5 Suppliers-WBE;
   b. initiate all solicitation at least five (5) business days prior to the bid opening date;
   c. solicit MBE and WBE subcontractors within the Work Area, as defined in the Instructions to Bidders Section A.31, and
   d. record on Form 16B information pertaining to all solicitations, quotes (solicited and unsolicited) and commitments from MBE and WBE firms.
4. By submitting this form, the Bidder certifies that it has solicited the MBE and WBE firms for all services for which it intends to enter into a subcontract and for all supplies for which it intends to purchase within the Contract scope of work.
FORM 16 - INSTRUCTIONS

1.0 Purpose
The purpose of Form GSMWBE-16 (Form 16) is to secure documentation that ensures that the Bidder has not discriminated against MBE and WBE subcontractors and suppliers in the Bidder’s solicitation of and commitments to subcontractors and suppliers. Form 16 is comprised of two parts: 16A – Certification and 16B - Record of MBE/WBE Solicitations and Commitments as well as these instructions. Before completing Form 16, the Department of General Services (Department) strongly encourages the Bidder to review the Instruction to Bidders Section A.31: Minority Business and Women Business Enterprise Participation for further instruction on completing Form 16 and consequences for providing incomplete or incorrect information.

2.0 Instructions for Form 16A – Certification
All Bidders must complete, sign and submit Form 16A - Certification (Form 16A) with their bids.

Instructions for Statement 1
Check box 1 and complete statement 1, if you commit to meet both MPLs for the project or if you commit to meet the MPL for either MBEs or WBEs.

A Bidder who commits to meet both the MPLs for MBEs and WBEs only needs to check the “yes” box for both MBEs and WBEs, and to have an authorized representative of the company sign the form. If the Bidder is selected for award, the Bidder will be required to submit detailed information including but not limited to copies of quotes and any contracts or letters of intent documenting the Bidder’s commitment to the MPLs within ten calendar days after notice of award from the Department. Failure to provide the documentation, satisfactory to the Department, detailing commitments made to MBEs and WBEs within ten (10) calendar days after notice of award from the Department shall result in rejection of the bid as non-responsive and the Bidder’s bid security shall be forfeited to the Department as liquidated damages for the bid default.

A Bidder who commits to only one MPL is required to indicate which MPL and to complete the remaining portions of the Form 16A and Form 16B in compliance with the instructions provided herein and the Instructions to Bidders Section A.31.

Instructions for Statement 2
Check box 2 and complete statement 2 if you do not commit to meet both MPLs but you have complied with the minimum solicitation requirements: you have solicited proposals from a minimum of 5 MBEs and 5 WBEs for subcontracting from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBEs and 5 WBEs for supplies.

A Bidder who does not commit to meet both MPLs but who meets the minimum solicitation requirements must:
1. Indicate the MBE and WBE participation levels that it has committed to in its bid.
2. Indicate by checking the first check box that it has provided in the space provided an explanation of its failure to commit to both MPLs. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
3. Indicate by checking the second check box that it has completed Form 16B.
4. Indicate by checking the third check box that it has included with its bid the additional documentation as required in these instructions and the Instructions to Bidders Section A.31.
5. Indicate by checking the fourth check box that it has conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.
6. Have an authorized representative of the company sign Form 16A.
Commonwealth of Pennsylvania
Department of General Services
GSMWBE-16 (804)

Failure to properly complete and submit Forms 16A and 16B and to provide the additional documentation as required in the Instruction to Bidders Section A.31 with the bid shall result in the rejection of the bid.

**Instructions for Statement 3**

Complete statement 3 if you do not commit to meet both MPLs and you have not complied with the minimum solicitation requirements: you have not solicited proposals from a minimum of 5 MBEs and 5 WBEs for subcontracting from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBEs and 5 WBE for supplies.

A Bidder who does not commit to both MPLs and who does not meet the minimum solicitation requirements must:

1. Indicate the MBE and WBE participation levels that it has committed to in its bid.
2. Indicate by checking the first check box that it has provided an explanation of its failure to commit to both MPLs. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
3. Indicate by checking the second check box that it has provided an explanation for not meeting the minimum solicitation requirements. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
4. Indicate by checking the third check box that it has completed Form 16B to the extent that it has solicited MBEs and WBEs and included it with its bid.
5. Indicate by checking the fourth check box that it has included with its bid the additional documentation as required in these instructions and the Instructions to Bidders Section A.31.
6. Indicate by checking the fifth check box that it has conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.
7. Have an authorized representative of the company sign Form 16A.

Failure to properly complete and submit Forms 16A and 16B and to provide the additional documentation required in the Instruction to Bidders Section A.31 with the bid shall result in the rejection of the bid.

**3.0 Instructions for Form 16B - Record of MBE/WBE Solicitations and Commitments**

A Bidder who commits in its bid documents to meet the MPLs does not need to complete Form 16B. Form 16B must be completed by the Bidder who does not commit to meet both MPLs as set forth in the Notice to Bidders. **A Bidder completing form 16B must solicit and commit to Department certified MBEs and WBEs only.** Firms certified by any other entity will not be recognized for purposes of compliance with these instructions and the invitation for bids. The Department’s searchable database of certified MBE/WBE firms appears on the Department’s website:

http://www.dgsapp.state.pa.us/imaginepa/bcabd/vendor_search.asp?bcabdRNAvrad6BC2C=

**Instructions for Block 1**

Provide your company name, federal employer identification number, address, telephone number, fax number, e-mail address and contact person. The e-mail address should be for the person within your organization who handles contract compliance or EEO-related issues.

**Instructions for Block 2**

Provide the Department’s contract number, project name, county in which project is located, and total amount of the bid. If more than one base bid is submitted, provide the total bid amount for Base Bid #1.

**Instructions for Blocks 3 - 7**

3. Enter the subcontractor or supplier’s company name exactly as it appears on the Department’s website list of certified MBEs/WBEs. Do not use a D/B/A (Doing Business As) name. List the address, zip code, county, telephone number with area code, and contact person’s name.
Commonwealth of Pennsylvania  
Department of General Services  
GSMWBE-16 (8/04)  

4. Indicate whether the firm is a Department-certified MBE or WBE. If the firm is both a Department-certified MBE and a Department-certified WBE, the Bidder will receive credit for the firm as either an MBE or a WBE, at the Bidder’s determination. The Department shall count a firm toward only one category.

5. Briefly describe the specific type of work to be performed and/or materials to be supplied by the listed Department-certified MBE or WBE. In order to count towards reaching the MPLs, the Bidder must solicit Department-certified MBEs/WBEs for the goods and services for which they are certified. For example, if an MBE/WBE is Department-certified for electrical supplies and the Bidder lists plumbing supplies, the Bidder will not receive credit for that firm. Geographical location may not be used as a reason for limiting MBE/WBE solicitations.

6. Enter the total dollar ($) amount of any (solicited and non-solicited) quote received. If the quote was received in the form of unit prices or hourly rates, a total dollar amount must still be provided. If the solicited subcontractor did not respond to the Bidder, the Bidder must indicate “No Response.” Copies of all MBE/WBE quotes (solicited and unsolicited) must be submitted with the bid. In addition, the bidder must submit with its bid an example of its request for quotation issued to MBE and WBE contractors and suppliers.

7. Enter the total dollar ($) amount of the contractual commitment made to the listed MBE/WBE. If the Bidder does not commit to use the quote from a MBE/WBE because lower a priced quote was received, the Bidder must provide an explanation with its bid and submit a copy of the lower priced quote. On partial commitments, the Bidder must provide an explanation with its bid why it made only a partial commitment and must submit a copy of the lower priced quote.

4.6 The Bureau of Minority and Women Business Opportunities

The Bureau of Minority and Women Business Opportunities (BMWBO) is available for technical assistance to all Bidders submitting proposals for this contract. A listing of Department-certified MBEs and WBEs is incorporated in the contract documents. Department certification of an entity as an MBE/WBE means only that the applicant for certification has submitted information that qualifies it as an MBE/WBE in terms of its ownership and control. It does not imply, and no Bidder shall infer, that the Department has in any way investigated or approved the entity’s competence to perform work. Please direct your question to:

FORM OF AGREEMENT DGS 1-C
THE PENNSYLVANIA STATE UNIVERSITY
OWNER AND CONTRACTOR

CONTRACT

THIS AGREEMENT made this __________ day of _____________________________
in the year Two Thousand Nine (2009) _____________________________________
by and between

______________________________________________________________

hereinafter called the Contractor and THE PENNSYLVANIA STATE UNIVERSITY, a corporation created and
existing under the laws of the Commonwealth of Pennsylvania, hereinafter called the Owner for the following project:

______________________________________________________________

In consideration of the promises set forth herein, and with intent to be legally bound, the parties agree as follows:

ARTICLE 1: THE WORK AND THE DOCUMENTS FORMING THE CONTRACT

The Work forming the subject of this Construction Contract is shown on Drawings titled:

______________________________________________________________
It is described in the Specification, consisting of the General Conditions of the Contract, Articles 1 to 14 inclusive and:

The said Drawings and Specifications together with the General Conditions, as hereinabove described, are as fully a part hereof as if hereto attached or herein repeated.

ARTICLE 2: THE PROFESSIONAL

References to the Professional in any of the Contract Documents shall refer to the Professional whose name appears hereafter.

The Professional shall either be a person or firm lawfully licensed to practice architecture or engineering or the appropriate office of the Owner as noted.

ARTICLE 3: THE CONTRACTOR'S DUTIES AND STATUS

The Contractor agrees to furnish the labor, material, tools, machinery, equipment, facilities, and supplies to do all things necessary for the construction and completion of the Work; to furnish efficient business administration and superintendence; to have at the Work whenever needed and to keep upon it at all times an adequate supply of workmen and materials, and to secure its execution in the best, most workmanlike, expeditious and economical manner.

The Contractor, recognizing the relations of trust and confidence established between himself and the Owner by the terms of this Agreement, undertakes to furnish his best skill and judgment and to cooperate loyally with the Professional in forwarding the interests of the Owner, and to have no pecuniary interest, direct or indirect, in the Contract or in its performance other than as disclosed in this Agreement.
The Contractor agrees to begin the Work contemplated by this Contract within Ten (10) days after notice from the Owner to proceed and to substantially complete the same, ready for the Owner's occupancy and use, within ________ calendar days after said Notice. Contractor agrees to complete all punch list items within ________ calendar days of substantial completion. Contractor agrees that time is of the essence of this Contract and if he shall fail to complete the Work within the time above specified, or such extension or extensions thereof as shall be granted, the Contractor shall pay Owner, as liquidated damages and not as a penalty for such failure, the sum of ________________________ Dollars ($_______) per day for each and every calendar day thereafter until such Work shall be substantially completed and ready for the Owner's occupancy and use. Provided, nevertheless, if the Contractor is delayed at any time in the progress of the Work by any act or neglect of the Owner or Professional, or of any employee of either, or of a separate Contractor employed by the Owner, or by changes ordered in the Work, or by labor disputes, fire, unavoidable casualties or other causes beyond the Contractor's control, or by delay authorized by the Owner, or by other causes which the Professional determines may justify delay, then the Contract Time shall be extended by Change Order for such reasonable time as the Professional may determine with the Owner's approval.

ARTICLE 4: OWNER'S REPRESENTATION

The Owner shall appoint a representative, who shall act for the Owner in the execution of this Contract.

ARTICLE 5: CONTRACT SUM

In consideration of the completion by the Contractor of the Work contemplated in this Contract in strict accordance therewith, the Owner agrees to pay to the Contractor the sum of ________________________ Dollars ($_______), which sum is not to be increased or diminished except as provided in Article 9 of the General Conditions relative to Changes in the Work.

ARTICLE 6: METHODS OF PAYMENTS

The Contractor shall each month submit to the Owner a statement in detail showing the amount of Work performed in the preceding calendar month, according to Article 11 of the General Conditions. Payments shall be made on valuation of Work done based on an approved Schedule of Values to be submitted by the Contractor to the Owner through the Professional of the quantities aggregating the total of the Contract, prior to the first application for payment. The Schedule of Values shall, when approved by the Professional, be used as a basis for determining the percentage of the Contract sum comprising each Certificate of Payment.

Payments shall be made on the basis of 94% of the approved monthly schedule of Work performed as hereinbefore determined.

Thirty (30) days after this Contract shall have been fully performed, the Professional shall issue a certificate for any balance due subject to the provisions of Article 11 of the General Conditions.

ARTICLE 7: LIENS/PERFORMANCE BOND

Notwithstanding and in addition to the provisions relative to liens set forth in Paragraph 11.8 of the General Conditions of the Contract, the parties hereto have executed a Waiver of Liens / Stipulation Against Liens Agreement, and Contractor has purchased a payment bond which shall serve as a guarantee of payment for the work, services, labor, materials and/or equipment provided by any and all subcontractors. Contractor hereby specifically waives all lien rights of subcontractors, as that term is defined under the Pennsylvania Mechanics' Lien Law of 1963. Contractor hereby covenants, promises and agrees that no mechanics' or
materialism's lien or claim, or any other lien or claim, will be filed or maintained on the Property, or any grounds or curtilages appurtenant thereto, or any other structure or property owned by the Owner, either by Contractor or any subcontractor, for or on account of any work, labor or materials supplied by any subcontractor in the performance of the Contract, or under any supplemental contract for extra work, in the erection, construction or completion of the improvements to the Property.

ARTICLE 8: MISCELLANEOUS PROVISIONS

8.1 APPLICABLE LAW

The interpretation and construction of this Agreement shall be governed by the laws of the Commonwealth of Pennsylvania. In the event litigation arises out of this contract, the parties agree to submit any claim to the competent courts of Centre County, Pennsylvania.

8.2 SUCCESSORS AND ASSIGNS

This Agreement shall be binding on the successors and assigns of the parties hereto.

8.3 ASSIGNMENT

Neither the Owner nor the Contractor shall assign, sublet or in any manner transfer any right, duty, or obligation under this Agreement without prior written consent of the other party.

8.4 PROVISIONS REQUIRED BY PENNSYLVANIA LAW OR FEDERAL LAW

8.4.1 Provisions Deemed Inserted. Each and every provision required to be inserted in Contractor Agreements by the law of Pennsylvania, or the lawful regulations of any agency of the Commonwealth, and, if the Project involves the use of federal funds, by any law of the United States of America or the lawful regulations of any agency thereof applicable to this Agreement, are included in the Agreement by reference, and this Agreement shall be read, interpreted, and enforced as if such provisions were set forth therein in full.

8.4.2 Nondiscrimination. So long as this Agreement is in effect, the Contractor agrees to the terms of the Nondiscrimination Clause attached hereto as Exhibit "A."

8.4.3 Contractor Integrity Provisions and Disclosure of Financial Interest. So long as this Agreement is in effect, the Contractor agrees to the Contractor Integrity Provisions attached hereto as Exhibit "B."

8.4.4 Contractor Responsibility Provision. Included in and made a part of this Agreement is Exhibit "C," Contractor Responsibility Provision.

8.4.5 Tax Liability Provisions. Included in and made part of this Agreement is Exhibit "D," Tax Liability Provisions.

8.4.6 Trade Practice Act. Included in and made part of this Agreement is Exhibit "E," Trade Practices Act Contract Clause.

8.4.7 Steel Product Procurement Act. Included in and made part of this Agreement is Exhibit "F," Steel Products Procurement Act Contract Clause.

8.4.8 Public Works Contractor's Bond Law. Included in and made part of this Agreement is Exhibit "G," Public Works Contractor's Bond Law of 1967 Contract Clause.

8.4.9 Pennsylvania Prevailing Wage Act. Included in and made part of this Agreement is Exhibit "H," Pennsylvania Prevailing Wage Act Contract Clause.

8.4.10 Minority Business and Women Business Enterprise Participation. Included in and made part of this Agreement is Exhibit "I," Minority Business and Women Business Enterprise Participation.
6.5 RELEASE OF INFORMATION

The Contractor understands and agrees that the Owner may release to taxing authorities any and all information relating to the Work.

THIS AGREEMENT entered into as of the day and year written above.

EXHIBIT A

NONDISCRIMINATION CLAUSE

During the term of this Contract, the Contractor agrees as follows:

1. Contractor shall not discriminate against any employee, applicant for employment, independent Contractor, or any other person because of race, color, religious creed, ancestry, national origin, age, sex or handicap. Contractor shall take affirmative action to insure that applicants are employed, and that employees or agents are treated during employment, without regard to their race, color, religious creed, ancestry, national origin, age, sex, or handicap. Such affirmative action shall include, but is not limited to, the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training. Contractor shall post in conspicuous places, available to employees, agents, applicants for employment, and other persons, a notice to be provided by the contracting agency setting forth the provision of this nondiscrimination clause.

2. Contractor shall, in advertisements or requests for employment placed by it or on its behalf, state all qualified applicants will receive consideration for employment without regard to race, color, religious creed, ancestry, national origin, age, sex, or handicap.

3. Contractor shall send each labor union or workers' representative with which it has a collective bargaining agreement or other Contract or understanding, a notice advising said labor union or workers' representative of its commitment to this nondiscrimination clause. Similar notice shall be sent to every other source of recruitment regularly utilized by Contractor.

4. It shall be no defense to a finding of noncompliance with this nondiscrimination clause that Contractor had delegated some of its employment practices to any union, training program, or other source of recruitment which prevents it from meeting its obligations. However, if the evidence indicates that the Contractor was not on notice of the third-party discrimination or made a good faith effort to correct it, such factor shall be considered in mitigation in determining appropriate sanctions.

5. Where the practice of a union or of any training program or other source of recruitment will result in the exclusion of minority group persons, so that Contractor will be unable to meet its obligations under this nondiscrimination clause, Contractor shall then employ and fill vacancies through other nondiscriminatory employment procedures.

6. Contractor shall comply with all state and federal laws prohibiting discrimination in hiring or employment opportunities. In the event of Contractor's noncompliance with the nondiscrimination clause of this Contract or with any such laws, this Contract may be terminated or suspended, in whole or in part, and Contractor may be declared temporarily ineligible for further Contracts, and other sanctions may be imposed and remedies invoked.

7. Contractor shall furnish all necessary employment documents and records to, and permit access to its books, records and accounts by the Contracting agency and the Office of Administration, Bureau of Minority and Women Business Opportunities (BMWBO) for purposes of investigation to ascertain compliance with the provisions of this clause. If Contractor does not possess documents or records reflecting the necessary information requested, it shall furnish such information on reporting forms supplied by the Contracting Agency and/or the Bureau of Minority and Women Business Opportunities (BMWBO).

8. Contractor shall actively recruit minority and women Subcontractors or Subcontractors with substantial minority representation among their employees.

9. Contractor shall include the provisions of this nondiscrimination clause in every Subcontract so that such provisions will be binding upon each Subcontractor.

10. Contractor's obligations under this clause are limited to the Contractor's facilities within Pennsylvania, or where the Contract is for purchase of goods manufactured outside of Pennsylvania, the facilities at which such goods are actually produced.

1/07

Exhibit A
Page 1 of 1
EXHIBIT B

CONTRACTOR INTEGRITY PROVISIONS

1. Definitions.
   a. Confidential Information means information that is not public knowledge, or available to the public on request, disclosure of which would give an unfair, unethical, or illegal advantage to another desiring a Contract with the Commonwealth and/or Owner.
   b. Consent means written permission signed by a duly authorized officer or employee of the Commonwealth and/or Owner, provided that where the material facts have been disclosed, in writing, by prequalification, bid, proposal, or contractual terms, the Owner shall be deemed to have consented by virtue of execution of this Agreement.
   c. Contractor means the individual or entity that has entered into this Agreement with the Commonwealth and/or Owner, including directors, officers, partners, managers, key employees, and owners of more than a five percent (5%) interest.
   d. Financial interest means:
      (1) Ownership of more than a five percent (5%) interest in any business; or
      (2) Holding a position as an officer, director, trustee, partner, employee, or the like, or holding any position of management.
   e. Gratuity means any payment of more than nominal monetary value in the form of cash, travel, entertainment, gifts, meals, lodging, loans, subscriptions, advances, deposits of money, services, employment, or contracts of any kind.

2. The Contractor shall maintain the highest standards of integrity in the performance of this Agreement and shall take no action in violation of state or federal laws, regulations, or other requirements that govern contracting with the Owner.

3. The Contractor shall not disclose to others any confidential information gained by virtue of this Agreement.

4. The Contractor shall not, in connection with this or any other agreement with the Commonwealth and/or Owner, directly or indirectly, offer, confer, or agree to confer any pecuniary benefit on anyone as consideration for the decision, opinion, recommendation, vote, other exercise of discretion, or violation of a known legal duty by any officer or employee of the Commonwealth and/or Owner.

5. The Contractor shall not, in connection with this or any other Agreement with the Commonwealth and/or Owner, directly or indirectly, offer, give, or agree or promise to give to anyone any gratuity for the benefit of or at the direction or request of any officer or employee of the Commonwealth and/or Owner.

6. Except with the consent of the Commonwealth and/or Owner, neither the Contractor nor anyone in privity with the Contractor shall accept or agree to accept from, or give or agree to give to, any person, any gratuity from any person in connection with the performance of Work under this Agreement except as provided therein.

7. Except with the consent of the Commonwealth and/or Owner, the Contractor shall not have a financial interest in any other Contractor, Subcontractor, or supplier providing services, labor, or material on this project.

1/07

Exhibit B
Page 1 of 2
8. The Contractor, upon being informed that any violation of these provisions has occurred or may occur, shall immediately notify the Commonwealth and/or Owner in writing.

9. The Contractor, by execution of this Agreement and by the submission of any bills or invoices for payment pursuant thereto, certifies and represents that the Contractor has not violated any of these provisions.

10. The Contractor, upon the inquiry or request of the Commonwealth and/or Owner, shall provide, or if appropriate, make promptly available for inspection or copying, any information of any type or form deemed relevant by the Commonwealth and/or Owner to the Contractor's integrity or responsibility, as those terms are defined by the Commonwealth's statutes, regulations, or management directives. Such information may include, but shall not be limited to, the Contractor's business or financial records, documents, or files of any type or form which refer to or concern this Agreement. Such information shall be retained by the Contractor for a period of three (3) years beyond the termination of the Contract unless otherwise provided by law.

11. For violation of any of the above provisions, the Commonwealth and/or Owner may terminate this and any other Agreement with the Contractor, claim liquidated damages in an amount equal to the value of anything received in breach of these provisions, claim damages for all expenses incurred in obtaining another Contractor to complete performance hereunder, and debar and suspend the Contractor from doing business with the Commonwealth and/or Owner. These rights and remedies are cumulative, and the use or nonuse of any one shall not prejudice the use of all or any other. These rights and remedies are in addition to those the Commonwealth and/or Owner may have under law, statute, regulation, or otherwise.
EXHIBIT C

CONTRACTOR RESPONSIBILITY PROVISION

1. Contractor certifies that it is not currently under suspension or debarment by the Commonwealth of Pennsylvania, any other state, or the federal government. Contractor also acknowledges that if it is currently under suspension or debarment, its bid, in most instances, will not be accepted or considered.

2. If Contractor enters into any subcontracts under this Contract with subcontractors who are currently suspended or debarred by the Commonwealth of Pennsylvania during the term of this Contract or any extensions or renewals thereof, the University shall have the right to require the Contractor to terminate such contracts.
EXHIBIT D

TAX LIABILITY PROVISIONS

1. The Contractor, by execution of the Contract:
   a. Certifies that the Contractor has no outstanding tax liability to the Commonwealth of Pennsylvania;
   b. Authorizes the Department of Revenue to release information related to its tax liability to the Department of General Services; and
   c. Authorizes the Commonwealth to offset any state and local tax liabilities of the Contractor or any of its subsidiaries, as well as any other amount due to the Commonwealth and/or Owner from the Contractor, against any payment due to the Contractor under a Contract with the Owner or the Commonwealth.

2. The certification of no outstanding tax liability is a material representation of fact upon which reliance is placed by the Commonwealth and/or Owner in entering into the Contract. If it is later determined that the Contractor knowingly rendered an erroneous certification, the Commonwealth and/or Owner may find the Contractor in default and terminate the Contract. Erroneous certification may also be grounds for the initiation of civil or criminal proceedings.
EXHIBIT E

TRADE PRACTICES ACT CONTRACT CLAUSE

1. In accordance with the Trade Practices Act of July 23, 1968, P.L. 688 (71 P.S. Section 773.101 et seq.), the Contractor cannot and shall not use or permit to be used in the Work any aluminum or steel products made in a foreign country which is listed below as a foreign country which discriminates against aluminum or steel products manufactured in Pennsylvania. The countries of Brazil, Spain, South Korea, Mexico, and Argentina have been found to discriminate against certain products manufactured in Pennsylvania. Therefore, the purchase or use of those countries' products, as listed below, is not permitted.

   a. Brazil: Welded carbon steel pipes and tubes; carbon steel wire rod; tool steel; certain stainless steel products including hot-rolled stainless steel bar, stainless steel wire rod and cold-formed stainless steel bars; prestressed concrete steel wire strand; hot-rolled carbon steel plate in coil; hot-rolled wire strand; hot-rolled carbon steel plate in coil; hot-rolled carbon steel sheet; and cold-rolled carbon steel sheet.

   b. Spain: Certain stainless steel products including stainless steel wire rod, hot-rolled stainless steel bars and cold-formed stainless steel bars; prestressed concrete steel wire strand; and certain steel products including hot-rolled steel plate, cold-rolled carbon steel plate, carbon steel structural shapes, galvanized carbon steel sheet, hot-rolled carbon steel bars and cold-formed carbon steel bars.

   c. South Korea: Welded carbon steel pipes and tubes; hot-rolled carbon steel plate; hot-rolled carbon steel sheet; and galvanized steel sheet.

   d. Mexico: Certain iron-metal construction castings including manhole covers, rings and frames, catch basin frames and grates, clean-out covers, grates, meter boxes, and valve boxes; galvanized carbon steel sheet; cold-rolled carbon steel sheet; carbon steel plate; carbon steel plate in coil; carbon steel plate cut to length; and small diameter carbon steel plate welded pipe.

   e. Argentina: Carbon steel wire rod and cold-rolled carbon steel sheet.

Penalties for violation of this paragraph may be found in the Trade Practices Act, which penalties include becoming ineligible for public works contracts for a period of three years.

NOTE: This provision in no way relieves the Contractor of responsibility to comply with those provisions of an invitation to bid which prohibits the use of foreign-made steel and cast-iron products.
1. In the performance of any Contract awarded pursuant to this Invitation to Bid, the Contractor, Subcontractors, materialmen, or suppliers shall use only steel products, rolled, formed, shaped, drawn, extruded, forged, cast, fabricated, or otherwise similarly, processed, or processed by a combination of two or more of such operations, from steel made in the United States by the open hearth, basic oxygen, electric furnace, Bessemer or other steel-making process. Steel products include not only cast-iron products but also machinery and equipment listed in United States Department of Commerce Standard Industrial Classifications 25 (furniture and fixtures), 35 (machinery, except electrical) and 37 (transportation equipment) and made of, fabricated from, or containing steel components. If a product contains both foreign and United States steel, it shall be determined to be a United States steel product only if at least 75 percent of the cost of the articles, materials, and supplies have been mined, produced, or manufactured, as the case may be, in the United States. Transportation equipment shall be determined to be a United States steel product only if it complies with Section 165 of Public Law 97-424 (96 Stat. 2136).

2. When unidentified steel products are supplied under a Contract, before any payment will be made, the Contractor must provide documentation including, but not limited to, invoices, bills of lading, and mill certification that the steel was melted and manufactured in the United States. If a steel product is identifiable from its face, the Contractor must submit certification which satisfies the Owner that the Contractor has fully complied with this provision. The Owner shall not provide for or make any payments to any person who has not complied with the Act. Any such payments made to any person by the Owner which should not have been made as a result of the Act shall be recoverable directly from the Contractor, Subcontractor, manufacturer, or supplier who did not comply with the Act.

3. In addition to the withholding of payments, any person who willfully violates any of the provisions of the Act shall be prohibited from submitting any bids to the Owner for a period of five years from the date of the determination that a violation has occurred. In the event the person who violates the provisions of the Act is a Subcontractor, manufacturer, or supplier, such person shall be prohibited from performing any work or supplying any materials to the Owner for a period of five years from the date of the determination that a violation has occurred.

4. The Contractor shall include the provisions of the Steel Products Procurement Act in every subcontract and supply Contract so that the provisions of the Act shall be binding upon each Subcontractor and supplier.
EXHIBIT G
PUBLIC WORKS CONTRACTOR'S BOND LAW OF 1967 CONTRACT CLAUSE

1. Prior to the award of any Contract, the Contractor to be awarded must furnish the following bonds which shall become binding upon the award of the Contract to the Contractor.

a. A performance bond at 100 percent of the Contract Amount, conditioned upon the faithful performance of the Contract in accordance with the plans, specifications, and conditions of the Contract. Such bond shall be solely for the protection of the University.

b. A payment bond at 100 percent of the Contract Amount. Such bond shall be solely for the protection of claimants supplying labor or materials to the Prime Contractor to whom the Contract was awarded, or to any of its Subcontractors, in the prosecution of the Work provided for in such Contract and shall be conditioned for the prompt payment of all such materials furnished or labor supplied or performed in the prosecution of the Work. "Labor or materials" includes public utility services and reasonable rentals of equipment, but only for the periods when the equipment rented is actually used at the site.
EXHIBIT H

Pennsylvania Prevailing Wage Act Contract Clause

1. The Contract with the awarded Contractor is subject to the provisions, duties, obligations, remedies, and penalties of the Pennsylvania Prevailing Wage Act, 43 P.S. Section 165-1 et seq., which is incorporated herein by reference as if fully set forth herein. The general prevailing minimum wage rates as determined by the Secretary of Labor and Industry shall be paid for each craft or classification of all workmen needed to perform this Contract during the term hereof for the locality in which the Work is to be performed.
EXHIBIT I

MINORITY BUSINESS AND WOMEN BUSINESS ENTERPRISE PARTICIPATION

1. Participation Level – MBE and WBE

a. Pursuant to the provisions of Executive Order No. 2004-6, the Department of General Services (DGS) has established minimum participation levels (MPLs) for utilization of Minority Business Enterprise (MBE) and Women Business Enterprise (WBE) subcontractors and suppliers for this project. A bidder’s MBE participation level is calculated by adding all dollar commitments to DGS-certified MBES and dividing that total amount by the total contract bid price. The bidder participation level for WBEs is similarly calculated by adding all dollar commitments to DGS-certified WBEs and dividing that total amount by the total contract bid price. Only DGS-certified MBES and WBEs may be used to achieve these MPLs. The MPLs are set forth in the Notice to Bidders in the following form:

<table>
<thead>
<tr>
<th>Project No. D.G.S.</th>
<th>MBE</th>
<th>WBE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Hazardous Building Materials Abatement</td>

</tbody>
</table>

b. Included in this invitation for bids is Form GSMWBE-16 (Form 16) which is comprised of two parts:

1. Certification (Form 16A).
2. Record of MBE/WBE Solicitations and Commitments (Form 16B)

**FORM 16A – CERTIFICATION MUST BE COMPLETED AND SIGNED BY EACH BIDDER AND SUBMITTED WITH ITS BID. FAILURE TO COMPLETE, SIGN AND SUBMIT THIS FORM WITH THE BID SHALL RESULT IN REJECTION OF THE BID.**

Form 16A requires bidders to respond to the MPLs in one of three ways:

1. A bidder can commit to meet both MPLs. If the bidder commits to meet both MPLs, no documentation in regard to MBE/WBE solicitations and commitments must be submitted with the bid.

2. A bidder can commit to meet participation levels lower than the MPLs, but must provide evidence by way of Form 16B – Record of MBE/WBE Solicitations And Commitments, and documentation (copies of MBE/WBE quotes) that it solicited a minimum of 5 MBE contractors and 5 WBE subcontractors within the Work Area (defined below) and 5 MBE suppliers and 5 WBE suppliers.

3. A bidder can commit to meet participation levels lower than the MPLs and can indicate that it did not solicit 5 MBE subcontractors, 5 WBE subcontractors, 5 MBE suppliers and 5 WBE suppliers but must provide a satisfactory written reason(s) for not soliciting the minimum number of MBEs and WBEs.
For item #1 above, a bidder must commit to meet both the MBE and WBE MPLs for the project. Bidders are encouraged to make these commitments. A bidder who commits to meet both the MBE and WBE MPLs only needs to check box 1, check the "yes" box for both MBEs and WBEs, sign the Certification form and submit it with its bid. The bidder is not required to:

(a) Complete the remaining portions of Form 16A - Certification;
(b) Complete Form 16B - Record of Solicitations and Commitments; or
(c) Submit any MBE/WBE solicitation/commitment documentation with its bid documents.

If the bidder is selected for award, the bidder will be required to submit detailed information including but not limited to any contracts or letters of intent documenting the bidder's commitment to the MPLs within ten (10) calendar days after notice of award from DGS.

For item #2 above, a bidder who does not, in its bid documents, commit to meet the MPLs but who has solicited a minimum of 5 MBEs and 5 WBEs for subcontracting and 5 MBEs and 5 WBEs for supplies, must:

(a) Complete and sign Form 16A – Certification;
(b) Complete Form 16B – Record of MBE/WBE Solicitations and Commitments; and
(c) Submit the completed Certification (Form 16A), the Record of MBE/WBE Solicitations and Commitments (Form 16B), copies of the MBE/WBE quotes that it received, and other applicable documentation concurrently with its bid.

Bidders must include information on the Record of MBE/WBE Solicitations And Commitments (Form 16B) identifying all MBEs and WBEs solicited, all MBE and WBE quotes received (solicited and unsolicited) and all MBEs and WBEs to which it has made commitments.

For item #3 above, a bidder who does not, in its bid documents, commit to the MPLs and who has not solicited 5 MBEs and 5 WBEs for subcontracting and 5 MBEs and 5 WBEs for supplies, must:

(a) Include in its bid documents the reason(s) that it did not solicit a minimum of 5 MBEs and 5 WBEs for subcontracting and 5 MBEs and 5 WBEs for supplies.
(b) Complete and sign Form 16A - Certification;
(c) Complete Form 16B - Record of MBE/WBE Solicitations and Commitments; and
(d) Submit the completed Certification (Form 16A), the Record of MBE/WBE Solicitation And Commitments (Form 16B), copies of MBE/WBE quotes that it received, and other applicable documentation concurrently with its bid.

Bidders must include information on Form 16B - Record of MBE/WBE Solicitations And Commitments identifying all MBEs and WBEs solicited, all MBE and WBE quotes received (solicited and unsolicited) and all MBEs and WBEs to which it has made commitments.
c. MBE/WBE subcontractors and manufacturers will be credited toward the MPLs at 100 percent of the total dollar value of the subcontract/supply contract. Stocking suppliers also are credited at 100 percent. Non-stocking suppliers, which are commonly and ordinarily the custom in the industry and a part of the industry's trade practice, also are credited at 100 percent of the total dollar value of the supply contract; non-stocking suppliers, which are not commonly and ordinarily the custom in the industry nor a part of the industry's trade practice, are not credited.

d. If the prime bidder is an MBE/WBE firm, DGS will not credit the value of the prime bidder's contract toward meeting the contract MPLs. All prime bidders (including MBE/WBE prime bidders) are expected to comply with these instructions to Bidders.

e. MBE/WBE subcontractors must perform at least seventy-five percent (75%) of the cost of the subcontract, not including cost of materials, with their own employees to be counted toward the MPLs.

f. A firm that is both an MBE and a WBE will receive credit toward the MPLs as either an MBE or WBE - not in both categories. Bidders must indicate on the Form 16B - Record of Solicitations and Commitments whether the firm is being listed as either an MBE or a WBE. If the bidder does not indicate whether it is using the firm as an MBE or a WBE, and that firm is certified as both an MBE and WBE, BMWBO shall credit the firm as either an MBE or a WBE.

2. Responsiveness

a. A bidder who commits in its bid documents to meet the MPLs in Form 16A - Certification, signs the Certification, and submits the Certification with its bid shall be presumed to be responsive. The bidder will be required to provide detailed information including but not limited to copies of quotes and any contractors or letters of intent documenting the bidder's commitment to the MPLs within ten (10) calendar days of a DGS request. Failure to provide the documentation, satisfactory to the Department, detailing commitments made to MBEs and WBEs within ten calendar days after notice of award from DGS shall result in rejection of the bid as non-responsive and the bidder's bid security shall be forfeited to DGS as liquidated damages for the bid default.

b. A bidder who does not commit in its bid documents to meet the MPLs must submit a completed Form 16A and 16B with its bid and must submit copies of all quotes (solicited and unsolicited) received from MBEs and WBEs. The bidder must comply with the following requirements in order to be considered responsive:

(1) **Minimum Solicitation Requirement.** Except as provided in subsections (4) and (5) below, where the amount bid exceeds $50,000 and the bidder does not commit to meet the MPLs, the bidder must solicit proposals from a minimum of 5 Department-certified MBE Subcontractors, 5 Department-certified WBE Subcontractors, 5 Department-certified MBE Suppliers, and 5 Department-certified WBE Suppliers. For clarity, unless the bidder commits to meeting the MPL for MBEs, the Bidder must solicit a minimum of 5 MBE Subcontractors and 5 MBE Suppliers. Similarly, unless the bidder commits to meeting the MPL for WBEs, the bidder must solicit a minimum of 5 WBE Subcontractors and 5 WBE Suppliers.
(2) **Work Area.** For subcontractors, solicitations must be made in the Work Area, which for the purposes of the Department’s MBE/WBE Policy is defined as the county in which the work is to be performed, adjoining counties, and any other county within a 50-mile radius of the job site. For subcontractors, except as provided in part (iv) below, if fewer than five eligible, Department-certified MBEs or five eligible, Department-certified WBEs exist within the Work Area, the bidder shall solicit from each category the maximum possible number of certified entities within the Work Area and solicit the remaining required number of certified entities outside of the Work Area.

(3) **Timely Solicitations.** The bidder must initiate all MBE/WBE solicitations no later than five (5) business days prior to the scheduled bid opening date.

(4) **Exemption of Minimum Solicitation Requirement for Subcontracting.** A bidder who will perform the contract work with its own forces is exempt from the minimum solicitation requirements for subcontractors only. If the bidder will perform the work with its own forces, it must provide an explanation on the Form 16A under statement 3.

(5) **Exemption of Minimum Solicitation Requirement for Supplies.** A bidder who will not need to procure supplies from any supplier or other outside resource is exempt from the minimum solicitation requirements for suppliers only. If the bidder will obtain no supplies from any resources outside of its own company, it must provide an explanation on the Form 16A under statement 3.

(6) **Written Explanations.** A bidder who does not commit to meet both MPLs must include a written explanation of its failure to commit to both MPLs on Form 16A under statement 2 or 3. This explanation must demonstrate that the bidder has not engaged in discriminatory practices. A bidder who does not meet the minimum solicitation requirement, including the exceptions identified in subsections (4) and (5) above, must provide a written explanation of its failure to do so on Form 16A under statement 3.

(7) **Solicitations.** Mailings intended to provide notice of a contractor's interest in bidding a construction contract to large numbers of MBEs and WBEs will not be deemed solicitations, but rather will be treated as informational notification only. A bidder should only solicit MBE/WBE subcontractors, manufacturers or suppliers whose work, material, or supplies are within the project scope and are related to project line items or portions thereof. Limited numbers of, or nonexistent, MBEs or WBEs in a geographic area, by itself, is not a reason for failing to solicit subcontractors, manufacturers or suppliers. Bidders must indicate whether minority or women businesses were solicited for each type of work the bidder expects to subcontract for and for all materials which the bidder expects to procure and, if not, the reason(s) solicitations were not made. The bidder must submit with its bid an example of its request for quotation issued to MBE and WBE contractors and suppliers.

(8) **DGS Certification.** BMWBO will credit only DGS-certified MBEs or WBEs toward a bidder's MPLs.

(9) **Commitments.** Bidders must indicate the reason why it has not committed to an MBE or WBE for a type of subcontract work or for certain supplies in any area where a quote was received from an MBE or WBE. Where the bidder receives no quotations and makes no commitments to MBEs or WBEs, the bidder must specify on Form 16B - Record of MBE/WBE Solicitations And Commitments that no quotes were received. If there is another reason why no commitments were made, then provide this reason. If the bidder fails to use a quote from an MBE or WBE because the bidder feels the quote was not competitive, the bidder must submit a copy of the lower or more competitive quote(s).
c. Failure to properly complete and submit Form 16A - Certification, and Form 16B - Record of MBE/WBE Solicitations And Commitments, and the required documentation with the bid shall result in the rejection of the bid. Failure to comply with the requirements in (1) through (3) of subparagraph 2.b. above shall also result in rejection of the bid as not responsive. If there is a technical deficiency in the information submitted on the Form, or if some or all of the required documentation is not submitted with the bid, or if the Department requests an explanation for the bidder's failure to comply with subparagraph 2.b.(3), then the Department, in its sole discretion, may notify the bidder by facsimile transmission or by express mail that the bidder has two (2) business days from the date of receipt of the notification to correct the deficiency. If the deficiency is not corrected within the two (2)-business day period, the bid will be rejected as nonresponsive. The two (2)-business day period is provided at the Department's discretion. The bidder is expected and required to make the necessary efforts regarding MBE and WBE subcontractors and suppliers five (5) business days prior to submission of the bid documents. A bidder who has not committed to meet the MPLs shall not be given the opportunity during the two (2)-business day period to solicit potential MBE/WBE subcontractors and suppliers. If a bidder fails to respond with the requested documentation within the two (2)-business day period, the Department may charge the difference between the nonresponsive bidder's bid price and the next responsive bidder's bid price against the nonresponsive bidder's bid security. Even if the Form 16A - Certification and Form 16B - Record of MBE/WBE Solicitations And Commitments are submitted and the bidder provides the documentation requested by DGS to establish its solicitations and commitments, DGS may also reject the bid if it determines that the bidder has discriminated against MBEs and/or WBEs in its solicitations and commitments to subcontractors or suppliers for the project.

d. Upon notice from the Department of the need to remedy any deficiency in the MBE/WBE submission requirements, the bidder should fully review the requirements as well as its submission and the subsequently provided information to ensure that the submission and the subsequently provided information fully comply with the requirements section A.31 and Form 16. The Department of General Services disclaims any and all responsibility for notifying the bidder of all deficiencies.

e. If a bidder is determined to be responsive, it does not mean that the bidder will be awarded the contract.

3. Responsibility

a. A bidder who does not commit to meet the MPLs for MBEs or WBEs shall meet the following standards for review:

(1) The bidder was not motivated by considerations of race or gender in failing to commit to the MPLs. If the bidder receives a solicited or unsolicited quote and does not commit to all or any portion of the quote, the bidder must provide a written explanation on Form 16A why the quote was not used, or why only a portion of the quote was used. The bidder must also furnish a copy of any competitive quote(s).

(2) The bidder must show that minority and women businesses were not treated less favorably than other businesses in the contract solicitation and commitment process.

(3) The bidder's solicitation and commitment decisions were not based upon policies, which discriminate against MBEs or WBEs.
b. Commitments to MBE and WBE firms made prior to contract award must be maintained throughout the term of any resulting contract, unless BMWBO has given prior written approval to a change in commitment to these firms.

c. If DGS selects a lower base bid, DGS may reduce the MBE/WBE commitments accordingly to reflect the reduction in the contract amount or changes in the contract scope. However, the MBE/WBE commitments remain intact if the deleted work does not affect the commitments.

4. Access to Information

BMWBO and the Office of the Inspector General may obtain documents and information that may be required to ascertain bidder or contractor responsibility from any bidder, contractor, subcontractor, supplier or manufacturer. If the bidder fails to provide requested information, the Department may declare the bidder not responsible. Information the Department obtains during a review of a firm’s solicitation and commitment process will be maintained on a confidential basis, to the extent permitted by law.

5. MBE/WBE Certification

a. BMWBO will not credit a bidder for MBE/WBE manufacturers, subcontractors or suppliers that are not DGS-certified as MBEs or WBEs. All firms listed in the bid documents – including out-of-state firms – must be DGS-certified as an MBE or WBE to receive credit.

b. DGS certification of an entity as an MBE or WBE means only that the applicant for certification has submitted information that qualifies it as an MBE or WBE in terms of its ownership and control. DGS certification does not imply, and no bidder shall infer, that the Department has in any way investigated or approved the entity’s competence to perform work.

c. Under the Act of December 21, 1994, No. 230, P.L. 210, 18 Pa. C.S.A. § 4017.2, a person commits a felony of the third degree, if, in the course of business, he or she engages in deception relating to MBE/WBE certification.

6. Bid as Part of the Contract

The bid of the successful bidder, including the completed MBE/WBE Solicitation/Commitment Sheet and accompanying documents regarding solicitation and commitments to MBEs and WBEs, becomes part of the contract.

7. Resources

a. The Bureau of Minority and Women Business Opportunities (BMWBO) is available for technical assistance to all bidders submitting proposals for this contract. A listing of Department-certified MBEs and WBEs is incorporated in the contract documents. Department certification of an entity as an MBE/WBE means only that the applicant for certification has submitted information that qualifies it as an MBE/WBE in terms of its ownership and control. It does not imply, and no bidder shall infer, that the Department has in any way investigated or approved the entity’s competence to perform work.

b. Contact the Bureau of Minority and Women Business Opportunities at 717/787-7380. Address correspondence to:

Bureau of Minority and Women Business Opportunities

MBE/WBE SUBCONTRACTOR AND SUPPLIER CERTIFICATION, SOLICITATION AND COMMITMENT FORM

This form, GSMWBE-16 (Form 16), is comprised of two parts: 16A - Certification and 16B - Record of MBE/WBE Solicitations and Commitments. Instructions on how to complete both parts of this form are provided at the end of this document.

FORM 16A – CERTIFICATION

This Form 16A must be completed and signed by each bidder and submitted with its bid.

Bidder name: ____________________________

Project #: ________________________________

☐ 1. We commit to meet the MPLs for the project as stated in the Notice to Bidders for:

   MBEs  Yes ___  No ___
   WBEs  Yes ___  No ___

If the answer for both MBEs and WBEs is “Yes” GO DIRECTLY TO THE SIGNATURE LINES AT THE END OF THIS CERTIFICATION. You do not need to complete the remainder of this form and you do not need to complete Form 16B.

If either answer is “No” you must check and complete either statement 2 or 3 below, sign this form and complete Form 16B.

☐ 2. We do not commit to meet both MPLs as stated in the Notice to Bidders. However, we did meet the minimum solicitation requirements (5 MBE subcontractors and 5 WBE subcontractors from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBE suppliers and 5 WBE suppliers) and we commit to the following participation levels:

   MBEs ___ %  WBEs ___ %

☐ We have included below an explanation of our failure to commit to both MPLs. (Attach additional sheets as necessary.)

   MBE: ____________________________
   WBE: ____________________________

☐ We have completed and included with our bid the Form 16B - Record of MBE/WBE Solicitations and Commitments.

☐ We included with our bid all additional documentation as required in the Form 16 - Instructions and the Instructions to Bidders Section A.31.

☐ We conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.

Failure to check all boxes under this statement 2, to indicate the MBE/WBE participation levels, and to provide a satisfactory explanation shall result in the rejection of your bid as not responsive.
3. We do not commit to meet both MPLs as stated in the Notice to Bidders and we did not meet the minimum solicitation requirements (5 MBE subcontractors and 5 WBE subcontractors from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBE suppliers and 5 WBE suppliers); however, we do commit to the following participation levels:

MBEs ___ %  WBEs ___ %

☐ We have included below an explanation of our failure to commit to both MPLs. (Attach additional sheets as necessary.)

MBE: __________________________________________

WBE: __________________________________________

☐ We have included below an explanation for our failure to comply with the minimum solicitation requirements. For example, if you do not intend to use any subcontractors you may state that fact as your reason for noncompliance. Complete as many as are appropriate. (Attach additional sheets as necessary.)

MBE subcontractors __________________________________________

WBE subcontractors __________________________________________

MBE suppliers __________________________________________

WBE suppliers __________________________________________

☐ To the extent that we have solicited MBEs and WBEs, we have completed and included with our bid the Form 16B - Record of MBE/WBE Solicitations and Commitments.

☐ We have included with our bid all additional documentation as required in the Form 16 - Instructions and the Instructions to Bidders Section A.31.

☐ We conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.

Failure to check all boxes under this statement 3, to indicate the MBE/WBE participation levels, and to provide satisfactory explanations shall result in the rejection of your bid as not responsive.

Signature Certification

I certify that the information on this form is true and correct to the best of my knowledge and that I am authorized to represent the above-named Bidder in connection with this certification.

Note to Bidders:
In completing this form, the Bidder must comply with the Form 16 - Instructions and the Instruction for Bidders Section A.31. The following is provided for informational purposes only.

1. If you commit in your bid to meet the MPLs for both MBEs and WBEs you do not need to complete this Form 16B.
2. If you do not commit in your bid to meet both MPLs you must complete this Form 16B and submit all additional documentation as required by the Instruction to Bidders Section A.31 and as described in the Form 16 - Instructions. Failure to do so will be sufficient cause for rejection of the bid as NOT RESPONSIVE.
3. In completing Form 16B, the Bidder shall (see Form 16 - Instructions and Instructions to Bidders Section A.31 for complete detail):
   a. solicit a minimum of 5 Subcontractors-MBE, 5 Subcontractors-WBE, 5 Suppliers-MBE and 5 Suppliers-WBE;
   b. initiate all solicitation at least five (5) business days prior to the bid opening date;
   c. solicit MBE and WBE subcontractors within the Work Area, as defined in the Instructions to Bidders Section A.31, and
   d. record on Form 16B information pertaining to all solicitations, quotes (solicited and unsolicited) and commitments from MBE and WBE firms.
4. By submitting this form, the Bidder certifies that it has solicited the MBE and WBE firms for all services for which it intends to enter into a subcontract and for all supplies for which it intends to purchase within the Contract scope of work.

FORM 16 - INSTRUCTIONS

1.0 Purpose
The purpose of Form GSMWBE-16 (Form 16) is to secure documentation that ensures that the Bidder has not discriminated against MBE and WBE subcontractors and suppliers in the Bidder’s solicitation of and commitments to subcontractors and suppliers. Form 16 is comprised of two parts: 16A – Certification and 16B – Record of MBE/WBE Solicitations and Commitments as well as these instructions. Before completing Form 16, the Department of General Services (Department) strongly encourages the Bidder to review the Instruction to Bidders Section A.31: Minority Business and Women Business Enterprise Participation for further instruction on completing Form 16 and consequences for providing incomplete or incorrect information.

2.0 Instructions for Form 16A – Certification
All Bidders must complete, sign and submit Form 16A – Certification (Form 16A) with their bids.

Instructions for Statement 1
Check box 1 and complete statement 1, if you commit to meet both MPLs for the project or if you commit to meet the MPL for either MBEs or WBEs.

A Bidder who commits to meet both the MPLs for MBEs and WBEs only needs to check the “yes” box for both MBEs and WBEs, and to have an authorized representative of the company sign the form. If the Bidder is selected for award, the Bidder will be required to submit detailed information including but not limited to copies of quotes and any contracts or letters of intent documenting the Bidder’s commitment to the MPLs within ten calendar days after notice of award from the Department. Failure to provide the documentation satisfactory to the Department, detailing commitments made to MBEs and WBEs within ten (10) calendar days after notice of award from the Department shall result in rejection of the bid as non-responsive and the Bidder’s bid security shall be forfeited to the Department as liquidated damages for the bid default.

A Bidder who commits to only one MPL is required to indicate which MPL, and to complete the remaining portions of the Form 16A and Form 16B in compliance with the instructions provided herein and the instructions to Bidders Section A.31.

Instructions for Statement 2
Check box 2 and complete statement 2 if you do not commit to meet both MPLs but you have complied with the minimum solicitation requirements: you have solicited proposals from a minimum of 5 MBEs and 5 WBEs for subcontracting from the “Work Area” as defined in the Instructions to Bidders Section A.31 and 5 MBEs and 5 WBE for supplies.

A Bidder who does not commit to meet both MPLs but who meets the minimum solicitation requirements must:

1. Indicate the MBE and WBE participation levels that it has committed to in its bid.
2. Indicate by checking the first check box that it has provided in the space provided an explanation of its failure to commit to both MPLs. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
3. Indicate by checking the second check box that it has completed Form 16B.
4. Indicate by checking the third check box that it has included with its bid the additional documentation as required in these instructions and the Instructions to Bidders Section A.31.
5. Indicate by checking the fourth check box that it has conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.
6. Have an authorized representative of the company sign Form 16A.
Commonwealth of Pennsylvania
Department of General Services
GSNWBE-16 (R04)

Failure to properly complete and submit Forms 16A and 16B and to provide the additional documentation as required in the Instruction to Bidders Section A.31 with the bid shall result in the rejection of the bid.

**Instructions for Statement 3**

Complete statement 3 if you do not commit to meet both MPLs and you have not complied with the minimum solicitation requirements: you have not solicited proposals from a minimum of 5 MBEs and 5 WBEs for subcontracting from the "Work Area" as defined in the Instructions to Bidders Section A.31 and 5 MBEs and 5 WBE for supplies.

A Bidder who does not commit to both MPLs and who does not meet the minimum solicitation requirements must:

1. Indicate the MBE and WBE participation levels that it has committed to in its bid.
2. Indicate by checking the first check box that it has provided an explanation of its failure to commit to both MPLs. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
3. Indicate by checking the second check box that it has provided an explanation for not meeting the minimum solicitation requirements. If the Bidder provides its explanation on a separate page it must indicate so in the space provided.
4. Indicate by checking the third check box that it has completed Form 16B to the extent that it has solicited MBEs and WBEs and included it with its bid.
5. Indicate by checking the fourth check box that it has included with its bid the additional documentation as required in these instructions and the Instructions to Bidders Section A.31.
6. Indicate by checking the fifth check box that it has conducted all initial MBE/WBE solicitations at least five (5) business days in advance of the bid opening day.
7. Have an authorized representative of the company sign Form 16A.

Failure to properly complete and submit Forms 16A and 16B and to provide the additional documentation required in the Instruction to Bidders Section A.31 with the bid shall result in the rejection of the bid.

**3.0 Instructions for Form 16B - Record of MBE/WBE Solicitations and Commitments**

A Bidder who commits in its bid documents to meet the MPLs does not need to complete Form 16B. Form 16B must be completed by the Bidder who does not commit to meet both MPLs as set forth in the Notice to Bidders. A Bidder completing Form 16B must solicit and commit to Department certified MBEs and WBEs only. Firms certified by any other entity will not be recognized for purposes of compliance with these instructions and the invitation for bids. The Department's searchable database of certified MBE/WBE firms appears on the Department's website: [http://www.dgsapp.state.pa.us/imaginepa/bcabd/vendor_search.asp?bcabdRNavra46BCZC=](http://www.dgsapp.state.pa.us/imaginepa/bcabd/vendor_search.asp?bcabdRNavra46BCZC=)

**Instructions for Block 1**

Provide your company name, federal employer identification number, address, telephone number, fax number, e-mail address and contact person. The e-mail address should be for the person within your organization who handles contract compliance or EEO-related issues.

**Instructions for Block 2**

Provide the Department's contract number, project name, county in which project is located, and total amount of the bid. If more than one base bid is submitted, provide the total bid amount for Base Bid #1.

**Instructions for Blocks 3 - 7**

3. Enter the subcontractor or supplier's company name exactly as it appears on the Department's website list of certified MBEs/WBEs. Do not use a D/B/A (Doing Business As) name. List the address, zip code, county, telephone number with area code, and contact person's name.
4. Indicate whether the firm is a Department-certified MBE or WBE. If the firm is both a Department-certified MBE and a Department-certified WBE, the Bidder will receive credit for the firm as either an MBE or a WBE, at the Bidder’s determination. The Department shall count a firm toward only one category.

5. Briefly describe the specific type of work to be performed and/or materials to be supplied by the listed Department-certified MBE or WBE. In order to count towards reaching the MPLs, the Bidder must solicit Department-certified MBEs/WBEs for the goods and services for which they are certified. For example, if an MBE/WBE is Department-certified for electrical supplies and the Bidder lists plumbing supplies, the Bidder will not receive credit for that firm. Geographical location may not be used as a reason for limiting MBE/WBE solicitations.

6. Enter the total dollar ($) amount of any (solicited and non-solicited) quote received. If the quote was received in the form of unit prices or hourly rates, a total dollar amount must still be provided. If the solicited subcontractor did not respond to the Bidder, the Bidder must indicate “No Response.” Copies of all MBE/WBE quotes (solicited and unsolicited) must be submitted with the bid. In addition, the bidder must submit with its bid an example of its request for quotation issued to MBE and WBE contractors and suppliers.

7. Enter the total dollar ($) amount of the contractual commitment made to the listed MBE/WBE. If the Bidder does not commit to use the quote from a MBE/WBE because lower a priced quote was received, the Bidder must provide an explanation with its bid and submit a copy of the lower priced quote. On partial commitments, the Bidder must provide an explanation with its bid why it made only a partial commitment and must submit a copy of the lower priced quote.

4.0 The Bureau of Minority and Women Business Opportunities

The Bureau of Minority and Women Business Opportunities (BMWBO) is available for technical assistance to all Bidders submitting proposals for this contract. A listing of Department-certified MBEs and WBEs is incorporated in the contract documents. Department certification of an entity as an MBE/WBE means only that the applicant for certification has submitted information that qualifies it as an MBE/WBE in terms of its ownership and control. It does not imply, and no Bidder shall infer, that the Department has in any way investigated or approved the entity’s competence to perform work. Please direct your question to:

ARTICLE 1 - GENERAL CONTRACT DEFINITIONS

1.1 THE CONTRACT DOCUMENTS

The Contract Documents consist of the Form of Agreement 1-C or Form of Agreement DGS 1-C, hereinafter called the Agreement, General Conditions of the Contract, Drawings, Specifications, Addenda issued prior to receipt of bids, Form of Proposal, other documents listed in the Agreement, and those modifications to the Contract as follows:

1.1.1 Owner's written authorization to the Contractor for changes to the Work

1.1.2 Change Order

1.1.3 A written order for a minor change in the Work issued by the Professional

1.2 THE CONTRACT

The Contract Documents form the Contract for Construction. The Contract represents the entire and integrated agreement between the parties hereto and supersedes all prior negotiations, representations or agreements either written or oral.

The Contract may be amended only by those modifications described in Paragraph 1.1.

1.3 OWNER

The Owner is The Pennsylvania State University, a corporation created and existing under the laws of the Commonwealth of Pennsylvania, hereinafter called the Owner, and shall mean the Owner or the Owner's authorized representative.

1.4 PROFESSIONAL

The Professional is the person lawfully licensed to practice architecture or engineering, or the firm employed to provide architectural or engineering services. The term "Professional" shall mean the Professional or the Professional's authorized representative.

1.5 CONTRACTOR

The Contractor is the individual, corporation, company, partnership, firm, or other organization that has contracted to perform the Work under the Agreement with the Owner. The term "Contractor" shall mean the Contractor or the Contractor's authorized representative.

1.6 SUBCONTRACTOR

A Subcontractor is a person or organization who contracts under, or for the performance of part or all of, the Contract between the Owner and the Contractor. The subcontract may be direct with the Contractor or with another Subcontractor. The term "Subcontractor" shall mean the Subcontractor or the Subcontractor's authorized representative.

1.7 THE WORK

The term "Work" shall mean whatever is done by or required of the Contractor to perform and complete its duties under this Contract, including the following: construction of the whole or a designated part of the Project; furnishing of any required surety bonds and insurance; and the provision or furnishing of labor, supervision, services, materials, supplies, equipment, fixtures, appliances, facilities, tools, transportation, storage, power, permits and licenses required of the Contractor; fuel, heat, light, cooling and all other utilities as required by this Contract.
1.8 THE PROJECT

The term "Project" shall comprise the Work defined by the Contract Documents and may include Work by the Owner or other Separate Contractors, or the Professional.

1.9 THE DRAWINGS

The Drawings are the graphic portion of the Contract Documents generally consisting of plans, elevations, sections, details, diagrams and schedules of the Work.

1.10 THE SPECIFICATIONS/PROJECT MANUAL

The Specifications are the written portion of the Contract Documents generally outlining the requirements for materials, equipment, construction systems, methods, standards, workmanship and performance necessary to properly complete the Work.

The Project Manual is the document assembled consisting of all the written portions for the Work including the Specifications, bidding requirements, sample forms, General Conditions and Special Requirements.

1.11 DAY

Whenever the word "day" is used in the Contract Documents, it shall be interpreted to mean a calendar day unless otherwise noted.

1.12 THE CONTRACT SUM

The Contract Sum is the total compensation payable to the Contractor for performing the Work as specified in the Contract Documents or subsequently adjusted by modification to the Contract.

1.13 CLAIM

A Claim is a demand or assertion by one of the parties seeking, as a matter of right, adjustment or interpretation of Contract terms, payment of money, extension of time or other relief with respect to the terms of the Contract. The term "Claim" also includes other disputes and matters in question between the Owner and Contractor arising out of or relating to the Contract. Claims must be made by written notice. The responsibility to substantiate Claims shall rest with the party making the Claim.

1.14 SCOPE OF WORK

All Work reasonably contemplated, required, implied or reasonably inferable by the Contract Documents, whether or not explicitly contained in the Contract Documents.

1.15 SUBSTANTIAL COMPLETION

"Substantial Completion" shall mean that stage in the progression of the Work when the Work is sufficiently complete in accordance with this Contract that the Owner can enjoy beneficial use or occupancy of the Work and can utilize the Work for its intended purpose.

ARTICLE 2 - CONTRACT DOCUMENTS

2.1 OWNERSHIP AND USE OF DOCUMENTS

All Drawings, Specifications and other documents of the Work furnished by the Professional are and shall remain the Professional's property. They are not to be used by the Contractor on other projects without written consent of the Owner and the Professional.
2.2 COPIES FURNISHED - DRAWINGS AND SPECIFICATIONS

The Professional will furnish to the Contractor, free of charge, three copies of Drawings and Specifications for the execution of the Work. The Drawings will be prints on paper, unmounted. Any additional copies of the Drawings and Specifications which the Contractor may desire will be furnished at the cost of reproduction and delivery.

2.3 DRAWINGS AND SPECIFICATIONS AT THE SITE

The Contractor shall maintain at the site one copy of all Drawings, Specifications, Addenda, approved Shop Drawings, Product Data, Samples and Contract Modifications, in good order and marked to record all changes made during construction.

2.4 AS-BUILT AND RECORD DRAWINGS

The Contractor shall, at the time of substantial completion of the Work, deliver to the Professional the complete set of as-built drawings. The Professional will, within 30 days after receipt from the Contractor, transcribe all changes recorded by the Contractor onto a full set of reproducible drawings, and CADD electronic media, compatible with the Owner's CADD system, which shall become the record drawings for the Project, and shall forward same to the Owner. A copy in CADD format compatible with the Owner's CADD system and a copy in .pdf format shall be forwarded to the Owner by the Professional. If Building Information Modeling is utilized on the project an additional alternate form of as-built/record drawings may be required to be submitted by both the Professional and Contractor.

2.5 INTERRELATIONSHIP AND INTENT OF DOCUMENTS

2.5.1 The intent of this Contract is to require complete, correct, and timely execution of the Work. Any Work that may be required, implied, or inferred by the Contract Documents, or any one or more of them, as necessary to produce the intended result shall be provided by the Contractor for the Contract Price.

2.5.2 This Contract is intended to be an integral whole and shall be interpreted as internally consistent. What is required by any one Contract Document shall be considered as required by the Contract.

2.5.3 When a word, term, or phrase is used in this Contract, it shall be interpreted or construed, first, as defined herein; second, if not defined, according to its generally accepted meaning in the construction industry; and third, if there is no generally accepted meaning in the construction industry, according to its common and customary usage.

2.5.4 The words "include," "includes," or "including," as used in this Contract, shall be deemed to be followed by the phrase, "without limitation."

2.5.5 The specification herein of any act, failure, refusal, omission, event, occurrence or condition as constituting a material breach of this Contract shall not imply that any other, nonspecified act, failure, refusal, omission, event, occurrence, or condition shall be deemed not to constitute a material breach of this Contract.

2.5.6 Words or terms used as nouns in this Contract shall be inclusive of their singular and plural forms, unless the context of their usage clearly requires a contrary meaning.

2.5.7 The Contractor shall have a continuing duty to read, carefully study and compare each of the Contract Documents, the Shop Drawings, and the Product Data and shall give written notice to the Owner of any inconsistency, ambiguity, error or omission which the Contractor may discover with respect to these documents before proceeding with the affected Work. The issuance, or the express or implied approval by the Owner or the Professional of the Contract Documents, Shop Drawings, or Product Data shall not relieve the Contractor of the continuing duties imposed hereby, nor shall any such approval be evidence of the Contractor's compliance with this Contract. The Owner has requested the Professional to only prepare documents for the Project, including the Drawings and Specifications for the Project, which are accurate, adequate, consistent, coordinate and sufficient for construction. HOWEVER, THE OWNER MAKES NO REPRESENTATION OR WARRANTY OF ANY NATURE WHATSOEVER TO THE CONTRACTOR CONCERNING

01/2009

GC, Page 7 of 37

Henderson - Biobehavioral Health Building
DGS 800-290/PSU 06-42744/BCJ 08001

12 November 2010

Section D
SUCH DOCUMENTS. By the execution hereof, the Contractor acknowledges and represents that it has received, reviewed, and carefully examined such documents, has found them to be complete, accurate, adequate, consistent, coordinated and sufficient for construction, and that the Contractor has not, does not, and will not rely upon any representation or warranties by the Owner concerning such documents as no such representation or warranties have been or are hereby made.

2.5.8 Neither the organization of any of the Contract Documents into divisions, sections, paragraphs, articles, (or other categories), nor the organization or arrangement of the Design, shall control the Contractor in dividing the Work or in establishing the extent or scope of the Work to be performed by Subcontractors.

2.5.9 The interrelation of the Drawings, the Specifications and the schedules is as follows:

2.5.9.1 The Drawings establish the quantities, dimensions and details.

2.5.9.2 The Specifications determine the nature and installation of the various materials and equipment.

2.5.9.3 The schedules give the locations.

2.5.9.4 The Drawings and Specifications are complementary and what is required by one shall be as binding as if shown or mentioned in both.

2.5.9.5 Should the Drawings disagree with one another, or with the Specifications, the better quality or greater quantity of Work or materials shall be performed or furnished. Dimensions given on Drawings govern small scale Drawings.

Dimensions given on Drawings govern scale measurements, and large scale details govern small scale drawings. In case of discrepancy in the Dimensions, in the Drawings, in the schedules, or in the Specifications, the matter shall be promptly submitted to the Professional who will promptly make a determination, after advice and consent of the Owner, in writing.

2.5.9.6 The "Scope of the Work," usually placed in the front part of each Section of the Specifications, is intended to designate the scope and locations of all items of the Work included therein, either generally or specifically. It is not intended to limit the Scope of Work should plans, schedules or notes indicate an increased scope. Inadvertent omission of an item from its proper section of the Specifications and its inclusion in another section shall not relieve the Contractor of responsibilities for the item specified.

ARTICLE 3 - INSURANCES AND BONDS

3.1 CONTRACTOR'S LIABILITY INSURANCE

The Contractor shall purchase from and maintain with a company or companies lawfully authorized to do business in the Commonwealth of Pennsylvania such insurance as will protect the Contractor from Claims set forth below which may arise out of or result from the Contractor's operations under the Contract and for which the Contractor may be legally liable, whether such operations be by the Contractor or by a Subcontractor or by anyone directly or indirectly employed by any of them, or by anyone for whose acts any of them may be liable:

3.1.1 Claims under the Workers' Compensation Act including Employers' Liability.

3.1.2 Claims for damages because of bodily injury, personal injury, sickness or disease, or death of any person other than the Contractor's employees.

3.1.3 Claims for damages, other than to the Work itself, because of injury to or destruction of tangible property, including loss of use resulting therefrom.

3.1.4 Claims for damages because of bodily injury, or property damage arising out of ownership, maintenance or use of a motor vehicle.

01/2009 GC, Page 8 of 37
3.1.5 Claims involving contractual liability insurance applicable to the Contractor's obligations under Paragraph 14.2 Indemnification.

The insurance required above shall be written for not less than limits of liability specified in the Contract Documents. Coverages, whether written on an occurrence or claims-made basis, shall be maintained without interruption from date of commencement of the Work until date of final payment and termination of any coverage required to be maintained after final payment.

Before commencing the Work, the Contractor and any Subcontractor shall purchase and maintain at its own expense until final completion and acceptance of the Work, the following minimum insurance:

3.1.6 Workers' Compensation for statutory obligations imposed by workers' compensation or occupational disease laws. Employers' Liability insurance shall be provided with a limit of not less than $100,000 for each subcategory of coverage.

3.1.7 Comprehensive Automobile Liability insurance with limits of liability not less than:

Bodily Injury Liability

$1,000,000 Combined Single Limit

Property Damage Liability

3.1.8 Commercial General Liability Insurance including the Broad Form Endorsement. Such policies shall show The Pennsylvania State University as an "additional insured," and include coverage for premises and operations, products and completed operations and contractual liability for all operations required to complete the Work, including, if applicable, coverage for damage caused by explosion, collapse, or damage to underground utilities with limits of liability not less than:

PROJECTS UNDER $1,000,000

Bodily Injury Liability

$1,000,000 Combined Single Limit

Property Damage Liability

PROJECTS OVER $1,000,000

Bodily Injury Liability

$5,000,000 Combined Single Limit

Property Damage Liability

The products and completed operations liability insurance shall be provided for a period of not less than two years after completion of the Work.

3.1.9 Special Hazards - If there is a possibility of special hazards existing in the Work contemplated, such hazards shall be covered by endorsement to the policy or policies.

Certificates of Insurance acceptable to the Owner shall be filed with the Owner prior to commencement of the Work. These Certificates and the insurance policies required by this paragraph shall contain a provision that coverages afforded under the policies will not be cancelled or allowed to expire until at least 30 days prior written notice has been given to the Owner. If any of the foregoing insurance coverages are required to remain in force after final payment and are reasonably available, an additional certificate evidencing continuation of such coverage shall be submitted with the final Application for Payment as required by Paragraph 11.8. Information concerning reduction in coverage shall be furnished by the Contractor with reasonable promptness in accordance with the Contractor's information and belief.

3.2 OWNER'S LIABILITY INSURANCE

The Owner shall be responsible for purchasing and maintaining the Owner's usual liability insurance. Optionally, the Owner may purchase and maintain other insurance for protection against Claims which may arise from operations under the Contract. The Contractor shall not be responsible for purchasing and maintaining this optional Owner's liability insurance unless specifically required by the Contract Documents.

01/2009

GC, Page 9 of 37
3.3 PROPERTY INSURANCE

Unless otherwise provided, the Owner shall purchase and maintain, in a company or companies lawfully authorized to do business in the Commonwealth of Pennsylvania, property insurance in the amount of the initial Contract Sum as well as subsequent modifications thereto for the entire Work at the site on a replacement cost basis subject to reasonable deductibles. Such property insurance shall be maintained, unless otherwise provided in the Contract Documents or otherwise agreed in writing by all persons and entities who are beneficiaries of such insurance, until final payment has been made as provided in Paragraph 11.8 or until no person or entity other than the Owner has an insurable interest in the property required by this Paragraph 3.3 to be covered whichever is earlier. This insurance shall include interests of the Owner, the Contractor, Subcontractors and Sub-subcontractors in the Work.

3.3.1 Property insurance shall be on an all-risk policy form and shall insure against the perils of fire and extended coverage and physical loss or damage including, without duplication of coverage, vandalism, malicious mischief, collapse, temporary buildings and debris removal including demolition occasioned by enforcement of any applicable legal requirements, and shall cover reasonable compensation for the Professional’s services and expenses required as a result of such insured loss. Coverage for other perils shall not be required unless otherwise provided in the Contract Documents.

3.3.2 If the Owner does not intend to purchase such property insurance required by the Contract and with all of the coverages in the amount described above, the Owner shall so inform the Contractor in writing prior to commencement of the Work. The Contractor may then obtain insurance which will protect the interests of the Contractor, Subcontractors and Sub-subcontractors in the Work, and by appropriate Change Order the cost thereof shall be charged to the Owner. If the Contractor is damaged by the failure or neglect of the Owner to purchase or maintain insurance as described above, without so notifying the Contractor, then the Owner shall bear all reasonable costs properly attributable thereto.

3.3.3 The property insurance has a deductible. The Contractor shall be responsible for the first $5,000 of such deductible. If the Owner or insurer increases the required minimum deductibles above the amounts so identified or if the Owner elects to purchase this insurance with voluntary deductible amounts, the Owner shall be responsible for payment of the additional costs not covered because of such increased or voluntary deductibles. Contractor’s payment towards the deductible will not exceed $5,000 per occurrence.

Boiler and Machinery Insurance

The Owner shall purchase and maintain boiler and machinery insurance required by the Contract Documents or by law, which shall specifically cover such insured objects during installation and until final acceptance by the Owner; this insurance shall protect the interests of the Owner, Contractor, Subcontractors and Sub-subcontractors in the Work.

Loss of Use Insurance

The Owner, at the Owner’s option, may purchase and maintain such insurance as will insure the Owner against loss of use of the Owner’s property due to fire or other hazards, however caused. The Owner waives all rights of action against the Contractor for loss of use of the Owner’s property, including consequential losses due to fire or other hazards however caused. If the Contractor requests in writing that insurance for risks other than those described herein or for other special hazards be included in the property insurance policy, the Owner shall, if possible, include such insurance, and the cost thereof shall be charged to the Contractor by appropriate Change Order.

The Owners shall file a certificate of insurance with the Contractor upon request.

Waivers of Subrogation

The Owner and Contractor waive all rights against (1) each other and any of their Subcontractors, Sub-subcontractors, agents and employees, each of the other, and (2) the Professional, Professional’s consultants, Separate Contractors described in Article 7, if any, and any of their Subcontractors, Sub-subcontractors, agents and employees, for damages caused by fire or other perils to the extent covered by property insurance obtained pursuant to this Paragraph 3.3 or other property insurance applicable to the

01/2005

GC, Page 10 of 37

Henderson - Biobehavioral Health Building
DGS 800-290/PSU 06-42744/BCJ 08001

12 November 2010
Section D
Work, except such rights as they have to proceeds of such insurance held by the Owner as fiduciary. The Owner or Contractor, as appropriate, shall require of the Professional, Professional’s consultants, Separate Contractors described in Article 7, if any, and the Subcontractors, Sub-subcontractors, agents and employees of any of them, by appropriate agreements, written where legally required for validity, similar waivers each in favor of other parties enumerated herein. The policies shall provide such waivers of subrogation by endorsement or otherwise. A waiver of subrogation shall be effective as to a person or entity even though that person or entity would otherwise have a duty of indemnification, contractual or otherwise, did not pay the insurance premium directly or indirectly, and whether or not the person or entity had an insurable interest in the property damaged.

A loss insured under Owner's property insurance shall be adjusted by the Owner as fiduciary and made payable to the Owner as fiduciary for the insureds, as their interests may appear, subject to requirements of any applicable mortgagee clause. The Contractor shall pay Subcontractors their just shares of insurance proceeds received by the Contractor, and by appropriate agreements, written where legally required for validity, shall require Subcontractors to make payments to their Sub-subcontractors in similar manner.

Partial occupancy or use in accordance with Paragraph 10.6 shall not commence until the insurance company or companies providing property insurance have consented to such partial occupancy or use by endorsement or otherwise. The Owner and the Contractor shall take reasonable steps to obtain consent of the insurance company or companies and shall, without mutual written consent, take no action with respect to partial occupancy or use that would cause cancellation, lapse or reduction of insurance.

3.4 PERFORMANCE AND PAYMENT BONDS

At the time of signing the Contract and before it becomes effective, the Contractor and its surety, acceptable to the Owner, shall execute two bonds each in the amount of 100% of the contract price of the Work awarded to the Contractor. The Bonds shall be written by a Surety authorized to do business in the Commonwealth of Pennsylvania and shall be delivered to the Owner prior to award of Contract and within three (3) days of the Owner's request thereof. The Attorney-in-Fact who signs the Bonds must be a resident of the Commonwealth of Pennsylvania and shall file with each Bond a certified and effectively dated copy of the Attorney-in-Fact's Power of Attorney.

One bond shall be a performance bond covering the faithful performance by the Contractor of all covenants and agreements on the part of the Contractor contained in this Contract.

The other bond shall be a labor and material payment bond protecting all parties that have performed labor or supplied material on this Contract from suffering any loss due to the failure of the Contractor to pay any or all obligations incurred under this Contract.

The Contractor shall pay all premiums for all bonds.

Upon the request of any person or entity appearing to be a potential beneficiary of bonds covering payment of obligations arising under the Contract, the Contractor or Owner shall promptly furnish a copy of the bonds or shall permit a copy to be made.

ARTICLE 4 - GOVERNING LAWS

4.1 GOVERNING LAW

The Contract shall be governed by the law of the Commonwealth of Pennsylvania. In the event litigation arises out of this Contract, the parties agree to submit any claim to the competent courts of Centre County, Pennsylvania.

4.2 COMPLIANCE WITH LAWS

The Contractor at all times shall observe and comply with all Federal, State and Local laws, by-laws, ordinances, codes and regulations, in any manner affecting the conduct of the Work or applying to any employees on the Project, as well as all orders or decrees which have been promulgated or enacted, or which may be promulgated or enacted during the progress of the Work, by any legal bodies or tribunals having authority or jurisdiction over the Work, materials, employees or the Contract.
Contractor shall indemnify and save harmless the Owner and all its officers, employees and agents from all suits, actions, or claims of any character or description brought for, made on account of, or arising from the violation of any such law, by-law, ordinance, regulation, order or decree.

4.3 PREVAILING WAGE ACT

The Contractor is hereby notified that this Contract is subject to the provisions, duties, obligations, remedies and penalties of the Pennsylvania Prevailing Wage Act, Act No. 442, August 15, 1961 (P.L. 987), and as amended August 8, 1983, Act No. 342; and said Act is incorporated herein by reference as fully as though the same were here set forth at length.

4.4 TAXES

The Contractor shall pay sales, consumer, use and similar taxes for the Work on portions thereof provided by the Contractor which are legally enacted when bids are received, whether or not yet effective or merely scheduled to go into effect.

The Contractor is obligated to pay all Pennsylvania sales tax with the exception of those items for which an exemption might be claimed under Sales and Use Tax Regulation 150 (61 Pa. Code SS31.11–SS31.16).

4.5 ROYALTIES AND PATENTS

The Contractor shall pay all royalties and license fees, and defend all suits or Claims for infringement of any patent rights and shall save the Owner harmless from loss on account thereof, except that the Owner shall be responsible for all such royalties and license fees and loss when a particular design or process, or the product of a particular manufacturer or manufacturers is specified; provided, however, if the Contractor has reason to believe the design, process or product specified constitutes an infringement of a patent, the Contractor shall be responsible for such royalties, license fees and loss unless the Contractor promptly gives such information to the Owner and the Professional.

ARTICLE 5 - STANDARDS, SUBSTITUTIONS, AND SHOP DRAWINGS

5.1 STANDARDS

Whenever a material, product or process is specified by reference to a governmental, trade association or similar standard, it shall comply with the requirements of the latest publication thereof, and amendment thereto, in effect on the bid date. Such standards are as effectively part of the Contract Documents as if therein printed.

5.2 SUBSTITUTIONS

The various materials, products or equipment specified in the Specifications are mentioned for the purpose of establishing a standard of quality and cost. It is not the intent to limit to any one product, but rather to set up the same as the standard desired or acceptable and to establish a basis of equality. Where trade or proprietary names, catalog numbers and manufacturers of materials, products or equipment are used or specified, whether or not followed by the words "or equal as approved by the Professional," materials, products or equipment to be equal in quality to that mentioned in the Specifications will be acceptable. It will be up to the Contractor, supplier and/or vendor to prove by the submission of proper data that their product is equal in quality to that specified.

These standards of quality were established and made only after careful study by the Professional and will, therefore, be strictly adhered to and all substandard materials, products or equipment will be rejected. Each Subcontractor, supplier and/or vendor shall in securing a substitution, submit a request in writing through the Contractor.

This request will then be forwarded to the Professional.

The Contractor shall obtain written approval of the Professional for all such substitutions of material, products, or equipment not less than five (5) working days before bids are due.
When submitting a request for a substitution, the requestor shall clearly indicate the item to be substituted, and shall include all calculations, catalog data, literature and/or drawings, so the substitution can be properly evaluated and processed in the shortest period of time.

Verbal communication regarding substitutions will not be construed as acceptance by the Professional and Owner, only written approvals on all substitutions will be valid.

The Professional will be the sole judge in evaluating and approving substitutions, and the Professional’s decisions with the Owner’s approval will be final.

No substitution for the above-named products or processes will be permitted after award of Contract, except as provided for below.

(i) The Contractor may submit substitute products or processes for consideration, fully documented as stated above, and accompanied by Contractor’s proposal the amount to be deducted from the Contract sum.

(ii) A substitution submitted by the Contractor for reason that a product is not available will not be considered unless written proof is submitted that a firm order for the product was placed within 45 days after Notice to Proceed.

5.3 SHOP DRAWINGS, PRODUCT DATA AND SAMPLES

Shop drawings, product data and samples are defined as follows:

5.3.1 Shop Drawings are drawings, diagrams, illustrations, schedules, performance charts, brochures and other data prepared by the Contractor, or any Subcontractor, manufacturer, supplier or distributor which illustrate some portion of the Work.

5.3.2 Product Data are illustrations, standard schedules, performance charts, instructions, brochures, diagrams and other information furnished by the Contractor to illustrate materials or equipment for some portion of the Work.

5.3.3 Samples are physical examples furnished by the Contractor to illustrate materials, equipment or workmanship, and to assist in the establishment of standards by which the Work will be judged.

Shop Drawings, Product Data and Samples are not Contract Documents. The purpose of their submittal is to demonstrate how the Contractor proposes to comply with the information given and the design concept outlined in the Contract Documents.

5.3.4 Shop Drawing Submittal Schedule: Based on the priorities of the construction schedule, the Contractor shall submit a shop drawing submittal schedule on or before the Second Regular Job Conference.

The Professional shall review and check the shop drawing submittal schedule within fifteen (15) days of receipt from the Contractor.

The Contractor shall thereafter submit all shop drawings, product data and samples in accordance with the approved submittal schedule.

The Contractor shall review all shop drawings, product data and samples for compliance with the Contract Documents and shall certify that the Contractor has done so by stamp, or otherwise, affixed to each copy thereof. Submittal data presented without such certification will be returned without review or other comment, and any delay resulting therefrom will be the Contractor’s responsibility. At the time of submission, the Contractor shall inform the Professional and Owner in writing of any deviation in the shop drawings, product data or samples from the requirements of the Contract Documents.

By approving and submitting shop drawings, product data and samples, the Contractor thereby represents that the Contractor has determined and verified all field measurements, field construction criteria, materials, catalog numbers and similar data, or will do so, and that the Contractor has checked and coordinated each shop drawing, product data and sample with the requirements of the Work and the Contract Documents and shall so certify as required above.
The Professional shall review, approve and process, subject to the right of review by the Owner, shop drawings, product data, samples, and other submissions of the Contractor as to compliance with the Contract Documents and for conformity to and harmony with the design concept of the Project and for compliance with the requirements of the Contract Documents. The Professional shall not approve any substitution of or deviation from specified materials and/or equipment without first obtaining the Owner’s consent.

The Professional shall return the approved shop drawings or detailed notation for resubmission if required, within twenty-one (21) days after receipt from the Contractor. The Professional shall act on any resubmissions within fifteen (15) calendar days of receipt thereof. A detailed log shall be maintained by the Professional as to time of receipt of the shop drawings and time of return with adequate notes as to their disposition.

If the Contractor considers any correction indicated on the revised shop drawings to constitute a change to the Contract Drawings or Specification, written notice shall be given promptly to the Owner and the Professional.

The Contractor shall make any corrections required and shall resubmit the required number of corrected copies of the shop drawings, product data, or new samples of materials until approved. The Contractor shall direct specific attention in writing to any new revisions other than the corrections requested on previous submissions. No Work requiring a shop drawing, product data, or sample submission shall be commenced until the submission has been approved. All such Work shall be in accordance with contract documents which shall include approved shop drawings, product data, and samples.

The approval of the shop drawings, product data or samples shall not relieve the Contractor of responsibility for any deviation from the requirements of the Contract Documents unless the Contractor has informed the Owner and the Professional in writing of such deviation at the time of submission and the Owner or the Professional has not objected to the specific deviation. The approval shall not relieve the Contractor from responsibility for errors or omissions in the shop drawings, product data, or samples. The approval of a separate item shall not indicate approval of an assembly in which the item functions.

The Owner reserves the right to review all Submittal data. No Work required by these submittals shall be commenced until the submittal has been approved by the Professional and Owner.

The approval of shop drawings, product data and samples by the Professional shall not be construed as a complete check, but will indicate only that the general method of construction and detailing is satisfactory. Approval of shop drawings, product data and samples will not relieve the Contractor of the responsibility for any error which may exist therein, and the Contractor shall be responsible for the dimensions and design of adequate connections, details, and the satisfactory construction of all Work.

Work done contrary to this procedure shall be at the risk and expense of the Contractor. All shop drawings used for fabrication and erection shall be those approved by the Professional, without change. If change is found to be necessary on any approved shop drawings or sample, it shall be resubmitted to the Professional for review and approval.

The number of copies of shop drawings and other submittals will be established at the Initial Job Conference. The Contractor shall bear the cost of all required shop drawing reproductions and scanning, if applicable. The project may opt to use an electronic submittal process and the Contractor shall bear the cost of all submissions in the required electronic .pdf format.

If the project opts to use an electronic submittal process the Contractor is required to submit a complete set of approved electronic submittals in .pdf format organized by CSI division to the Owner at the time of Substantial Completion.

All Operation and Maintenance data is required to be submitted in electronic .pdf format to the Owner subsequent to approval by the Professional. The Contractor is required to organize information by system and CSI division. Exact requirements to be outlined by the Owner. One hard copy may also be requested by the Owner.
ARTICLE 6 - KNOWLEDGE OF CONTRACT REQUIREMENTS

6.1 NOTICE

The Contractor, its Subcontractors and materialmen shall consult in detail the Project Manual, the General Conditions of the Contract, all Divisions and Sections of the Specifications, all Drawings, and all Addenda to the Project Manual for instructions and requirements pertaining to the Work, and at its and their cost shall provide all labor, materials, equipment and services necessary to furnish, install and complete the Work in strict conformance with all provisions thereof.

6.2 EXAMINATION AND CONDITIONS AT THE SITE

The Contractor is responsible for having visited the site and having ascertained and informed itself, its Subcontractors and materialmen, of all pertinent local conditions such as location, accessibility, and general character of the site or building, the character and extent of existing Work within and adjacent to the site, any other Work being performed thereon at the time of the submission of the Contractor's proposal, and subsurface conditions. Any failure to do so will not relieve the Contractor from responsibility for successfully performing the Work without additional expense to the Owner.

6.3 EXAMINATION OF CONTRACT DOCUMENTS

The Contractor will be held to have examined the Contract Documents, and Modifications thereto, as they may affect subdivisions of the Work and to have informed itself, its Subcontractors, Sub-subcontractors and materialmen of all conditions thereof affecting the prosecution of the Work.

The Scope of the Work for the Contract is not necessarily limited to the description of each section of the Specifications and the illustrations shown on the drawings. Include all minor items not expressly indicated in the Contract Documents, or as might be found necessary as a result of field conditions, in order to complete the Work as it is intended, without any gaps between the various subdivisions of Work of the Contractor, or between the Work of all Subcontractors.

The Contractor shall at once report to the Professional errors, inconsistencies or omissions discovered. The Contractor shall not be liable to the Owner or Professional for damage resulting from errors, inconsistencies or omissions in the Contract Documents unless the Contractor recognized such error, inconsistency or omission and failed to report it to the Professional. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission in the Contract Documents without such notice to the Professional, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the attributable costs for correction.

6.4 LABOR

The Contractor will be held to be thoroughly familiar with all conditions affecting labor in the location of the Project, including, but not limited to, unions, incentive pay, procurement, living and commuting conditions, and to have informed its Subcontractors and Sub-subcontractors thereof.

ARTICLE 7 - CONTRACT ADMINISTRATION

7.1 GENERAL ADMINISTRATION

The Professional will provide general administration of the Contract beginning with the execution of the Agreement between the Contractor and the Owner until expiration of the Contractor's one year guarantee period against defective materials, equipment and/or workmanship.

The Professional shall advise and consult with the Owner and will have authority to act on behalf of the Owner to the extent provided in the Contract Documents. The extent of the Professional's duties and responsibilities and the limitations of the Professional's authority as outlined hereunder shall not be modified without written agreement between the Owner and the Professional.

7.2 CONTRACT ADMINISTRATION COMMUNICATIONS AND INTERPRETATION

7.2.1 Communications: The Owner assumes no responsibility for any understanding given or representation made orally by the Owner's agents prior to the execution of this Contract,
unless such understanding(s) or representation(s) are expressly stated in the Contract. The Owner assumes no responsibility for any conclusions or interpretations made by the Contractor. Any failure by the Contractor to become acquainted with available information will not relieve the Contractor from responsibility for properly estimating the difficulty or cost of successfully performing the Work or mutually agreed changes thereto.

The Owner's instructions to the Contractor will generally be issued through the Professional except that the Owner reserves the right on appropriate occasions to issue instructions directly to the Contractor through the Owner's designated representative.

Communications by and with the Professional's consultants shall be through the Professional. Communications by and with Subcontractors and material suppliers shall be through the Contractor. Communications by and with the Owner's Separate Contractors shall be through the Owner.

All instructions affecting contract sum, contract time, or contract interpretation shall be confirmed expeditiously in writing with copies furnished to the Professional, the Owner's designated representatives, and the Contractor by the party issuing the instruction. No instruction affecting the Professional's design liability shall be issued without the Professional's prior written consent.

7.2.2 Interpretation: The Professional will be, in the first instance, the interpreter of the requirements of the Contract Documents. The Professional will, within a reasonable time, render such interpretation as the Professional may deem necessary for the proper execution or progress of the Work. All interpretations by the Professional shall be defined in writing and/or by drawing and shall be consistent with the intent of the Contract Documents. In its capacity as interpreter, the Professional will exercise its best efforts to insure faithful performance by the Contractor.

The Professional's decisions on matters relating to aesthetic effect will be final with the Owner's consent and if consistent with the intent expressed in the Contract Documents.

7.3 ACCESS TO AND INSPECTION OF THE WORK

The Professional, the Owner and their authorized representatives shall be provided full and safe access to the Work at all times by the Contractor for their observation and/or inspection of same.

The Professional, or an authorized and qualified representative, shall visit the project periodically as required by the Owner during periods of active construction, review the progress of the Work, and take such actions as in the Professional's judgment are necessary or appropriate to achieve the requirements of the Contract Drawings and Specifications in the Work of the Contractor, including advising the Owner as to particular matters to watch and guard against. The Professional will have its consultants visit the site periodically as required during their respective phases of the Work at such intervals as may reasonably be deemed necessary by the Owner and the Professional, to review their respective phases of the Work in order to achieve the requirements of the Contract Drawings and Specifications.

In addition to the above, the Professional shall be required to attend, at the determination of the Owner, any and all project site conferences dealing with interpretation of the Contract Documents.

The Owner shall be consulted by the Contractor on matters pertaining to the Work and shall transmit instructions of the Professional regarding the Work to the Contractor.

The Owner will, in addition to the Professional's inspection, inspect all Work under Contract. While the Owner will assist the Contractor in obtaining additional information in explanation of the Contract Documents and will serve as liaison between the Contractor and the Professional, the Owner is not empowered to authorize deviations from the Contract, except by a written modification as identified in Paragraph 1.1, nor to enter into the Contractor's area of responsibility for supervision and construction means, methods, techniques, sequences, procedures or coordination or for safety of persons and property. The fact that the Owner may have permitted faulty Work or Work not in accordance with the Contract Documents to be performed shall not relieve the Contractor from any responsibility to perform fully in accordance with the Contract.
The Work will be subject to inspection by the Owner and by representatives of the Professional as outlined above; however, such representatives are not authorized to make oral changes in any provision of the Drawings or Specifications except as provided in Article 9, Changes in the Work. Changes resulting from such inspections will be processed in the manner prescribed in Article 9. The absence or presence of the Owner shall not relieve the Contractor from any requirements of the Contract.

The Owner reserves the right to inspect, at their sources, all materials, supplies or services not manufactured or performed within the Contractor’s on-site facility. Such inspection shall not constitute acceptance, nor shall it replace in any way the Contractor’s responsibility for inspection or requirement to furnish acceptable materials.

The Owner will notify the Contractor of any non-compliance with the Contract Documents and the action required; and, the Contractor shall take immediate corrective action. If the Contractor fails or refuses to take prompt action, the Owner may issue an order stopping all or part of the Work until the Contractor takes appropriate action. No part of the time lost due to any such stop orders shall be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

7.4 SEPARATE CONTRACTS

The Owner reserves the right to award other, separate contracts in connection with other portions of the Project under these or similar conditions of the Contract and/or to perform construction or operations related to the Project with the Owner’s own forces.

When separate contracts are awarded for different portions of the Project, the term “this Contractor” shall mean the Contractor referred to in these Contract Documents, and the term “Separate Contractor” shall mean the Contractor who executes each separate Owner/Contractor Agreement.

If part of this Contractor’s Work depends for proper execution or results upon construction or operations by the Owner or a Separate Contractor, this Contractor shall, prior to proceeding with that portion of the Work, promptly report to the Professional apparent discrepancies or defects in such other construction that would render it unsuitable for such proper execution and results. Upon receipt of such report, the Professional shall make a determination as to the unsuitability of such other construction. Failure of this Contractor to so report shall constitute an acknowledgment that the Owner’s or Separate Contractor’s completed or partially completed construction is fit and proper to receive the Contractor’s Work, except as to defects not then reasonably discoverable and which may develop in the Owner’s or Separate Contractor’s construction after the execution of this Contractor’s Work.

This Contractor shall promptly remedy damage wrongfully caused by this Contractor to completed or partially completed construction or to property of the Owner or Separate Contractors. Should this Contractor cause damage to the Work or property of any Separate Contractor on the Project, this Contractor shall, upon due notice, endeavor to settle with such other Contractor by agreement. If such Separate Contractor sues the Owner on account of any damage alleged to have been so sustained, the Owner shall notify this Contractor who shall defend such proceedings and pay all costs in connection therewith, and if any judgment against the Owner arises therefrom, this Contractor shall pay or satisfy it.

This Contractor shall afford the Owner and Separate Contractors reasonable opportunity for introduction and storage of their materials and equipment and performance of their activities and shall connect and coordinate this Contractor’s construction and operations with theirs as required by the Contract Documents.

7.5 CLAIMS AND DISPUTES

7.5.1 Claims: Claims by either party must be made within twenty-one (21) days after occurrence of the event giving rise to such Claim or within twenty-one (21) days after the claimant first becoming aware or reasonably should have become aware of the condition giving rise to the Claim, whichever is later. Claims must be made by written notice. An additional Claim made after the initial Claim has been implemented by Change Order will not be considered unless submitted in a timely manner.

Pending final resolution of a Claim unless otherwise agreed in writing, the Contractor shall proceed diligently with performance of the Contract and the Owner shall continue to make payments in accordance with the Contract Documents.
7.5.2 Claims for Concealed or Unknown Conditions: If conditions are encountered at the site which are (1) subsurface or otherwise concealed physical conditions which differ materially from those indicated in the Contract Documents or discoverable by the Contractor or (2) unknown physical conditions of an unusual nature, which differ materially from those ordinarily found to exist and generally recognized as inherent in construction activities of the character provided for in the Contract Documents, then notice by the observing party shall be given to the other party promptly before conditions are disturbed and no later than forty-eight (48) hours after first observance of the conditions. The Professional will promptly investigate such conditions and, if they differ materially and cause an increase or decrease in the Contractor's cost of, or time required for, performance of any part of the Work, will recommend an equitable adjustment in the Contract Sum or Contract Time, or both. If the Professional determines that the conditions at the site are not materially different from those indicated in the Contract Documents or discoverable by the Contractor and that no change in the terms of the Contract is justified, the Professional shall so notify the Owner and Contractor in writing, stating the reasons. Claims by either party in opposition to such determination must be made within twenty-one (21) days after the Professional has given notice of the decision.

The failure by the Contractor to make the written notice and claims as provided in this subparagraph shall constitute a waiver by the Contractor of any claim arising out of or relating to such concealed or unknown condition.

7.5.3 Claims for Additional Cost: If the Contractor wishes to make Claim for an increase in the Contract Sum, the Contractor shall give written notice of such claim to the Professional and the Owner within twenty-one (21) days after the occurrence of the event or first appearance of the condition giving rise to such Claim and before proceeding to execute the Work. The failure by the Contractor to give such notice within the time permitted and prior to executing the Work shall constitute a waiver of claim for additional compensation. Prior notice is not required for Claims relating to an emergency endangering life or property arising under Paragraph 8.5.

In connection with any claim by the Contractor against the Owner for compensation in excess of the Contract Price, any liability of the Owner for the Contractor's costs shall be strictly limited to direct costs incurred by the Contractor and shall in no event include indirect costs or consequential damages of the Contractor. The Owner shall not be liable to the Contractor for claims of third parties, including Subcontractors, unless and until liability of the Contractor has been established therefore in a court of competent jurisdiction.

7.5.4 Claims for Additional Time: If the Contractor wishes to make Claim for an increase in the Contract Time, written notice as provided herein shall be given to the Professional and the Owner at the time of any Change Order proposal submitted. If the Contractor believes additional time is involved for reasons including but not limited to (1) changes ordered to the Contract or because of (2) strikes, (3) lockouts, (4) fire, (5) unusual delay in transportation, (5) or any cause beyond the Contractor's control, which constitute a justifiable delay, Claim shall be filed in accordance with the procedure established herein.

If unusual inclement weather conditions are the basis for a Claim for additional time, such Claim shall be documented by data substantiating that weather conditions were abnormal for the period of time and could not have been reasonably anticipated, and that weather conditions prevented the execution of major and/or critical items of the Work.

Unusual inclement weather as used herein means unusually severe weather which is beyond the normal weather recorded and expected for the locality and/or the season or seasons of the year. Normal weather shall be determined based on records for the closest stations of the United States Environmental Data Service and for a period of ten (10) years.

Any claim for extension of time on account of labor strike or lock-out shall be supported by a certificate of all facts concerning the strike, including, but not limited to, the dates, the craft(s) concerned, the reason for the strike, efforts to resolve the dispute, and efforts to minimize the impact of the strike on progress.

Any claim for extension of time on account of delays in transportation, or for failure of
suppliers, shall be supported by a certificate of all the facts involved, demonstrating that the delays were beyond the Contractor's control and including, but not limited to, the Contractor's efforts to overcome such delays.

If the Contractor fails to make such claim as required in this subparagraph within twenty-one (21) days of such occurrence giving rise to the claim, any claim for extension of time shall be waived.

7.5.5 Injury or Damage to Person or Property: If either party to the Contract suffers injury or damage to person or property because of an act or omission of the other party, of any of the other party’s employees or agents, or of others for whose acts such party is legally liable, written notice of such injury or damage, whether or not insured, shall be given to the other party within a reasonable time not exceeding twenty-one (21) days after first becoming aware of such injury or damage. The notice shall provide sufficient detail to enable the other party to investigate the matter. If a Claim for additional cost or time relates to this Claim is to be asserted, it shall be filed as provided in Subparagraphs 7.5.3 or 7.5.4 respectively.

7.5.6 Decision of the Professional: Claims, including those alleging an error or omission by the Professional, shall be referred initially to the Professional for action as provided in Subparagraph 7.5.7. A decision by the Professional, as provided in Subparagraph 7.5.7, shall be required as a condition precedent to litigation of a Claim between the Contractor and Owner as to all such matters arising prior to the date final payment is due, regardless of whether such matters relate to execution and progress of the Work or (2) the extent to which the Work has been completed. The decision by the Professional in response to a Claim shall not be a condition precedent to litigation in the event (1) the position of Professional is vacant, (2) the Professional has not received evidence or has failed to render a decision within agreed time limits, (3) the Professional has failed to take action required under Subparagraph 7.5.7 within thirty (30) days after the Claim is made, (4) forty-five (45) days have passed after the Claim has been referred to the Professional.

7.5.7 Resolution of Claims and Disputes: The Professional will review Claims and take one or more of the following preliminary actions within ten (10) days of receipt of a Claim: (1) request additional supporting data from the claimant, (2) submit a schedule to the parties indicating when the Professional expects to take action, (3) reject the Claim in whole or in part, stating reasons for rejection, (4) recommend approval of the Claim by the other party or (5) suggest a compromise. The Professional may also, but is not obligated to, notify the surety of the nature and amount of the Claim.

If a Claim has been resolved, the Professional will prepare or obtain appropriate documentation.

If a Claim has not been resolved, the party making the Claim shall, within ten (10) days after the Professional's preliminary response, take one or more of the following actions: (1) submit additional supporting data requested by the Professional, (2) modify the Initial Claim or (3) notify the Professional that the Initial Claim stands.

If a Claim has not been resolved after consideration of the foregoing and of further evidence presented by the parties or requested by the Professional, the Professional will notify the parties in writing that the Professional's decision will be made within seven (7) days. Upon expiration of such time period, the Professional will render to the parties the Professional's written decision relative to the Claim, including any change in the Contract Sum or Contract Time or both. If there appears to be a possibility of a Contractor's default, the Professional may, but is not obligated to, notify the surety and request the surety's assistance in resolving the controversy.

7.6 CONTRACT TERMINATION

7.6.1 Termination by Contractor: If the Work is stopped for a period of ninety (90) days under an order of any court or other public authority having jurisdiction, or as a result of an act of government, such as a declaration of a national emergency making materials unavaiable, through no act or fault of the Contractor or a Subcontractor or their agents or employees or
any other persons performing any of the Work under a contract with the Contractor, then the Contractor may, upon ten (10) additional days' written notice to the Owner and the Professional, terminate the Contract and recover from the Owner payment for all Work executed and for any loss sustained upon any materials, equipment, tools, construction equipment and machinery, including reasonable profit associated with such Work or losses and reasonable expenses resulting from such termination.

If the cause of the Work stoppage is removed prior to the end of the ten (10) day notice period, the Contractor may not terminate the Contract.

7.6.2 Termination by Owner: If the Contractor refuses or fails, except in cases for which extension of time is provided, to supply enough properly skilled workmen or proper materials to perform the Work, or disregards laws, ordinances, rules, regulations or orders of any public authority having jurisdiction, or otherwise is in violation of a provision of the Contract Documents, or fails to so prosecute the Work as to insure its completion, within the time, or any extension thereof, specified in this Contract, then the Owner may, without prejudice to any right or remedy and after giving the Contractor and its surety ten (10) days' written notice, terminate the Work and services of the Contractor and take possession of the site and of all materials, equipment, tools, construction equipment and machinery thereon owned by the Contractor. In such case, the Contractor shall not be entitled to receive any further payment until the Work is finished.

If the Contractor shall generally not pay its debts as they become due or shall admit in writing its inability to pay its debts, or shall make a general assignment for the benefit of creditors; or if the Contractor shall commence any case, proceeding or other action seeking to have an order for relief entered in its behalf as debtor or to adjudicate it as bankrupt or insolvent, or seeking reorganization, arrangement, adjustment, liquidation, dissolution or composition of it or its debts under any law relating to bankruptcy, insolvency, reorganization or relief of debtors or seeking appointment of a receiver, trustee, custodian or other similar official for it or for all or any substantial part of its property; or if the Contractor shall take any action to authorize or in contemplation of any of the actions set forth above in this paragraph, then this Agreement will automatically terminate upon written notification by Owner to Contractor and its surety.

Should the surety fail to respond within fifteen (15) days following the date of the notice of termination given to the surety and fail to pursue completion of the Work with diligence acceptable to the Owner, the Owner may arrange for completion of the Work and deduct the cost thereof from the unpaid Contract Sum remaining, including the cost of additional professional services made necessary by such default or neglect, in which event no further payment shall then be made by the Owner until all costs of completing the Work shall have been paid.

If the unpaid balance of the Contract Sum exceeds the costs of finishing the Work, including compensation for the Professional's additional services made necessary thereby, such excess shall be paid to the Contractor. If such costs exceed the unpaid balance, the Contractor or its surety shall pay the difference to the Owner. This obligation for payment shall survive the termination of the Contract.

7.6.3 Termination for Convenience of Owner: Prior to, or during the performance of the Work, the Owner reserves the right to terminate the Contract for unforeseen causes including but not limited to court orders, loss of funding, acts of the federal government to discontinue the Work, etc., that may occur. Upon such an occurrence, the following procedures will be adhered to:

7.6.3.1 The Owner will immediately notify the Professional and the Contractor in writing, specifying the effective termination date of the Contract.

7.6.3.2 After receipt of the notice of termination, the Contractor shall immediately proceed with the following obligations, regardless of any delay in determining or adjusting any amounts due at that point in the Contract:

(1) Stop all Work.
(2) Place no further subcontracts or orders for materials or services.
(3) Terminate all subcontracts.
(4) Cancel all material and equipment orders as applicable.
(5) Take action that is necessary to protect and preserve all property related to this Contract which is in the possession of the Contractor.

7.6.3.3 Within one hundred eighty (180) days of the date of the notice of termination, the Contractor shall submit a final termination settlement proposal to the Owner based upon costs up to the date of termination, reasonable profit on Work done only, and reasonable demobilization costs. If the Contractor fails to submit the proposal within the time allowed, the Owner may determine the amount due to the Contractor because of the termination and shall pay the determined amount to the Contractor.

7.6.3.4 If the Contractor and the Owner fail to agree on the settlement amount, the matter will be handled as a dispute through the procedures as outlined in Subparagraphs 7.5.6 and 7.5.7.

7.6.4 Written Notice: Written notice shall be considered to have been duly given if delivered in person to the individual or member of the firm or to an officer of the corporation for whom it is intended, or if delivered at or sent by United States mail to the last business address known.

ARTICLE 8 - CONSTRUCTION

8.1 CONSTRUCTION SCHEDULE, FIELD MEASUREMENTS AND SUPERVISION

8.1.1 Construction Schedule: The Contractor, promptly after being awarded the Contract, shall prepare and submit for approval by the Professional, a construction schedule for the Work. The schedule shall not exceed time limits as contained in the Contract Documents, shall be revised at appropriate intervals as required by the conditions of the Work and Project, shall be related to the entire Project to the extent required by the Contract Documents, and shall provide for expeditious and practicable execution of the Work.

The construction schedule shall be coordinated with the Contractor's shop drawing submittal schedule.

8.1.2 Field Measurements: The Contractor shall take field measurements and verify field conditions and shall carefully compare such field measurements and conditions and other information known to the Contractor with the Contract Documents before commencing activities. Errors, inconsistencies or omissions discovered shall be reported to the Professional at once.

8.1.3 Supervision: The Contractor shall supervise and direct the Work. The Contractor shall be solely responsible for all construction means, methods, techniques, safety, sequences and procedures, and for coordinating all portions of the Work under the Contract. The Contractor shall be responsible for inspection of portions of Work already performed under this Contract to determine that such portions are in proper condition to receive subsequent Work.

The Contractor shall employ a competent superintendent who shall be in attendance at the Project site during the progress of the Work. The superintendent shall be satisfactory to the Owner, and shall not be changed except with the written approval of the Owner unless the superintendent leaves the employment of the Contractor. The superintendent shall represent the Contractor and shall have full authority to act on the Contractor's behalf. All communications given to the superintendent shall be as binding as if given to the Contractor. All oral communications affecting contract time, contract cost and contract interpretation will be confirmed in writing.

8.2 SUBCONTRACTS

As soon as practicable after the execution of the Contract, the Contractor shall submit to the Professional, for approval, a list of all Subcontractors, including those who are to furnish materials or equipment; that
the Contractor and/or its major Subcontractors propose to employ in the construction of the Project. The Contractor shall not employ any Subcontractor to whom the Professional or Owner may have an objection.

A change in any approved Subcontractor or the addition of any new Subcontractor can only be made with the written approval of the Owner and Professional.

The Contractor agrees to bind every Subcontractor, and every Subcontractor agrees to be bound, by the terms of the Agreement, the General Conditions of the Contract, and the Drawings and Specifications insofar as they are applicable to the Subcontractor's respective portion of the Work. The Contractor shall further more fully inform each of its Subcontractors, prior to executing an agreement with, conformance with related documents and to submit Cost Estimates and Change Order proposals in complete and full analytical detail when so required or requested. The Contractor shall indemnify the Owner for any Subcontractor's claim which may result from the failure of the Contractor to incorporate the provisions of this Contract in the Contractor's agreements with any of its Subcontractors.

8.2.1 **Contingent Assignment of Subcontracts:** Each subcontract agreement for a portion of the Work is hereby assigned by the Contractor to the Owner provided that:

8.2.1.1 Assignment is effective only after termination of the Contract by the Owner for cause pursuant to Subparagraph 7.6.2 and only for those subcontract agreements which the Owner accepts by notifying the Subcontractor in writing.

8.2.1.2 Assignment is subject to the prior rights of the surety obligated under bond relating to the Contract.

8.3 **PERMITS, FEES AND NOTICES**

The Contractor shall secure and pay for, with the exception of the building permit, all other permits, fees, licenses and inspections necessary for the proper execution and completion of the Work which are customarily secured after execution of the Agreement and which are legally required.

It is not the Contractor's responsibility to ascertain that the Contract Documents are in accordance with applicable laws, statutes, ordinances, building codes, and rules and regulations. However, if the Contractor observes that portions of the Contract Documents are at variance therewith, the Contractor shall promptly notify the Professional and Owner in writing, and necessary changes shall be accomplished by appropriate modification.

If the Contractor performs Work knowing it to be contrary to laws, statutes, ordinances, building codes, and rules and regulations without such notice to the Professional and Owner, the Contractor shall assume full responsibility for such Work and shall bear the attributable costs.

8.4 **ACTS AND OMISSIONS**

The Contractor shall be responsible for acts and omissions of the Contractor's employees and Subcontractors, their agents and employees and other persons performing portions of the Work under a contract with the Contractor.

The Contractor shall not be relieved of obligations to perform the Work in accordance with the Contract Documents either by activities or duties of the Professional in the Professional's administration of the Contract, or by tests, inspections or approvals required or performed by persons other than the Contractor.

8.5 **PROTECTION OF PERSONS AND PROPERTY**

8.5.1 **OSHA:** It shall be the duty and responsibility of the Contractor and all its Subcontractors and their agents and employees, and other persons performing portions of the Work under a contract with the Contractor to be familiar and comply with all requirements of Public Law 91-596, the Occupational Safety and Health Act of 1970 (OSHA) and all amendments thereto, and to enforce and comply with all of the provisions of this Act.
8.5.2 Safety: Safety is the utmost importance to the Owner. Therefore, at a minimum, the Owner requires the following:

A. The Contractor must provide a site specific written safety program. The safety plan must address all public interfaces, critical activities, and overall project safety. The first pay application will not be processed until this safety plan submission is received.

B. The Contractor's on-site superintendent must be 30-hour OSHA certified. Proof of certification is required. Date of certification must be within (6) years of the start of the project.

C. The Contractor's Safety Director must visit the site on a monthly basis. Inspection report from the site visit must be distributed to the Owner.

D. 100% eye protection is required on the construction site. Eye protection must be ANSI approved safety glasses.

E. OSHA recordable accident data must be submitted to the Owner prior to final payment.

Note: Receiving a satisfaction rating of 'Poor' in the safety section of the contractor performance evaluation conducted during construction or after completion of the project is grounds for immediate complete (all trades) removal from the Office of Physical Plant contractor prequalification listing.

8.5.3 Emergencies: In an emergency affecting safety of persons or property, the Contractor shall act, at its discretion, to prevent threatened damage, injury or loss. Additional compensation or extension of time claimed by the Contractor on account of an emergency shall be considered in accordance with Paragraph 7.5 and Article 9.

8.5.4 Precautions: The Contractor shall take appropriate precautions for safety of and shall provide necessary protection to prevent damage, injury or loss to:

8.5.4.1 Employees of the Owner at the Work and other persons who may be affected thereby.

8.5.4.2 The Work and materials and equipment to be incorporated therein, whether in storage on or off the site, under care, custody or control of the Contractor or the Contractor's Subcontractors or Sub-subcontractors.

8.5.4.3 Other property at the site or adjacent thereto, such as trees, shrubs, lawns, walks, pavements, roadways, structures and utilities not designated for removal, relocation or replacement in the course of construction.

The Contractor shall erect and maintain, as required by existing conditions and performance of the Contract, all necessary safeguards for safety and protection, including posting of danger signs, installing project fencing, and other warnings against hazards.

When the use of explosives are necessary for execution of the Work and such use is approved by the Owner, the Contractor shall conform to the procedures specified.

The Contractor shall not load or permit any part of the construction or site to be loaded so as to endanger its safety.

8.5.5 Hazardous Material: The Contractor and all its Subcontractors and their agents and employees and other persons performing portions of the Work under a contract with the Contractor shall have no responsibility for the discovery, presence, handling, removal or disposal of, or exposure of persons to hazardous materials in any form at the Project site, including but not limited to asbestos, asbestos products, polychlorinated biphenyl (PCB) or other toxic material.

If the Contractor encounters or suspects hazardous or toxic material, the Contractor shall advise the Owner immediately.
The Work in the affected area shall not be resumed by the Contractor until the hazardous material has been removed or rendered harmless by the Owner.

8.5.6 **Property Damage Repair:** The Contractor shall promptly remedy any damage and loss (other than damage or loss insured under property insurance required by the Contract Documents) to property referred to in Subparagraphs 8.5.4.2 and 8.5.4.3 caused in whole or in part by the Contractor, a Subcontractor, their agents and employees or any other persons performing portions of the Work under a contract with the Contractor.

### 8.6 MATERIALS AND WORKMANSHIP

The Contractor shall provide and pay for labor, materials, equipment, tools, construction equipment and machinery, water, heat, utilities, transportation and other facilities and services necessary for proper execution and completion of the Work, whether temporary or permanent and whether or not incorporated or to be incorporated in the Work.

All Work shall be executed in accordance with the Contract Documents, complete in all parts and in accordance with approved practices and customs, the finish specified and of the best workmanship. Unless otherwise specified, all materials and equipment incorporated in the Work under the Contract shall be new.

The Contractor shall provide, without extra charge, all incidental items required as a part of the Work, even though not particularly specified nor indicated and, if the Contractor has good reason for objecting to the use of a material, appliance, or method of construction as shown or specified, the Contractor shall register its objections to the Professional, in writing, sending a copy to the Owner; otherwise, the Contractor shall proceed with the Work, with the understanding that a satisfactory job is required.

8.6.1 **Use of Site:** The Contractor shall confine operations at the site to areas indicated in the Contract Documents and shall not unreasonably encumber the site with materials or equipment.

Subject to prior approval of the Owner, the Contractor may use spaces within the building for shops and the storage of materials and equipment. Every space so used shall be repaired, patched, cleaned and restored to new condition by the Contractor.

8.6.2 **Cutting and Patching:** The Contractor shall be responsible for cutting, fitting or patching required to complete the Work or to make its parts fit together properly.

The Contractor shall not damage or endanger any portion of the Work or fully or partially completed construction of the Owner or Separate Contractors by cutting, patching or otherwise altering such construction, or by excavation. The Contractor shall not cut or otherwise alter such construction by the Owner or a Separate Contractor except with consent of the Owner and of such Separate Contractor; such consent shall not be unreasonably withheld. The Contractor shall not unreasonably withhold from the Owner or a Separate Contractor the Contractor's consent to cutting or otherwise altering the Work.

The Contractor or a Subcontractor or Sub-subcontractor requiring the cutting of openings in, or relocation of, Work installed by others shall have such openings cut and patched and relocations made by the trade skilled in performing the particular Work; and such cutting, patching and relocation shall be at the expense of the Contractor, Subcontractor, or Sub-subscontractor requiring the opening or relocation.

### 8.7 TESTS AND INSPECTIONS

Tests, inspections and approvals of portions of the Work required by the Contract Documents or by laws, ordinances, rules, regulations or orders of authorities having jurisdiction shall be made at an appropriate time. The Contractor shall schedule and coordinate such tests, inspections and approvals with the independent testing laboratory. The Owner or Owner's agent will retain the testing services unless indicated otherwise by the contract documents. The Contractor shall give the Professional timely notice of when and where tests and inspections are to be made so the Professional may observe such procedures.
In addition, the Owner or the Professional may require special inspection, testing or approval of material or Work for compliance with the requirements of the Contract Documents. Upon direction of the Owner and Professional, the Contractor shall promptly arrange for such special testing, inspection or approval procedure. Should the material or Work fail to comply with the requirements of the Contract Documents, the Contractor shall bear all costs of the testing, inspection or approval as well as the cost of replacement of unsatisfactory material or Work as provided by Paragraph 8.8; otherwise, the Owner shall bear such costs and an appropriate Change Order shall be issued.

8.8 UNCOVERING, REJECTION AND CORRECTION OF WORK

8.8.1 Uncovering of Work: If any portion of the Work is covered contrary to the Professional’s or the Owner’s request or to the requirements of the Contract Documents, it must, if requested by the Professional or Owner, be uncovered for observation by the Professional or Owner. All costs of uncovering, recovering and replacing of Work not installed in accordance with the Contract Documents shall be borne by the Contractor and with no change in Contract Time.

Any other portion of the Work requested to be uncovered by the Professional or the Owner and found not to be in accordance with the Contract Documents shall be replaced by the Contractor. The Contractor shall bear all the costs of uncovering and replacing of such Work. If the portion of Work uncovered is found to be in accordance with the Contract Documents, the costs of uncovering and recovering shall be paid by the Owner by appropriate Change Order.

8.8.2 Rejection and Correction of Work: Any Work rejected by the Professional or the Owner or found not to be in accordance with the Contract Documents shall be corrected promptly by the Contractor at its cost and with no change in Contract Time.

The Contractor shall bear the cost of correcting destroyed or damaged construction, whether completed or partially completed, of the Owner or separate Contractors caused by the Contractor’s correction or removal of Work which is not in accordance with the requirements of the Contract Documents.

If the Contractor fails to correct rejected or nonconforming Work, the Owner may correct it in accordance with Paragraph 8.9.

8.8.3 Acceptance of Nonconforming Work: If the Owner prefers to accept Work found not to be in accordance with the Contract Documents, the Owner may do so, in which case the Contract Sum will be reduced downward appropriately as determined by the Owner.

8.9 OWNER’S RIGHT TO STOP AND/OR CARRY OUT THE WORK

8.9.1 Owner’s Right to Stop the Work: If the Contractor fails to correct rejected or nonconforming Work as required in Subparagraph 8.8.2 or fails to carry out Work in accordance with the Contract Documents the Owner may, in writing, order the Contractor to stop the Work, or any portion thereof until the proper corrective action has been implemented.

8.9.2 Owner’s Right to Carry Out the Work: If the Contractor fails or neglects to carry out the Work in accordance with the Contract Documents, or ceases Work for a period of seven (7) consecutive days, the Owner may, without prejudice to other remedies the Owner may have, perform or cause to be performed the Work.

In such case an appropriate Change Order shall be issued deducting from payments then or thereafter due the Contractor the cost of performing Work pursuant to this subsection. If payments then or thereafter due the Contractor are not sufficient to cover such amounts, the Contractor shall pay the difference to the Owner.

8.10 CLEANUP

The Contractor shall keep the premises clean at all times of dirt, rubbish and debris resulting from the Work, and shall remove rubbish and debris in metal containers at the end of each working day. The Contractor shall remove rubbish and cartons resulting from the installation of fixtures and equipment. Prior to substantial completion of the Work, the Contractor shall do the final cleaning and polishing of the...
surfaces of the Contractor's installations as may be required by the various Specifications sections. The Contractor, in addition, shall employ a professional cleaning organization to remove all paint and stains from glass, and to wash all glass, throughout the Work, to clean and polish the finished surface of all fixtures, equipment and accessories and to vacuum clean all floors.

If the Contractor fails to clean up as outlined above, the Owner may do so and the cost thereof shall be charged to the Contractor.

8.11 CONSTRUCTION WASTE MANAGEMENT

The contractor is required to recycle and/or salvage 75% of construction, demolition, and land clearing waste. A waste management plan is to be developed for the project which outlines how you will achieve the required recycling rate, including materials to be recycled or salvaged, materials handling requirements, and how you will communicate the plan to your crews and subcontractors. The waste management plan is to be approved by the OPP Project Leader and submitted with the initial pay application.

At the end of the project, prior to final payment, the contractor is required to submit a calculation documenting that the project achieved a 75% diversion rate. Final payment will be held until this documentation is received. The documentation should include a tabulation of the total waste material, quantities diverted and the means by which diverted. A signature declaring that the requirements have been met must be included.

If the 75% diversion requirement is not met it will be documented on the contractor evaluation and this failure to meet the requirement is grounds for removal from the prequalification list.

If this project is attempting to achieve LEED certification, the LEED process to achieve the Construction Waste Management credit(s) supersedes this section.

ARTICLE 9 - CHANGES IN THE WORK

9.1 CHANGES

Except as provided in this article, no order, oral statement or direction of the Professional or the Owner shall be treated as a Change Order or entitle the Contractor to an adjustment to the Contract Sum and/or the Contract Time.

The Owner, without invalidating the Contract, may order changes in the Work within the general scope of the Contract consisting of additions, deletions or other revisions, the Contract Sum and the Contract Time being adjusted accordingly. All such changes in the Work shall be authorized by Change Order and shall be performed under the applicable conditions of the Contract Documents. If such changes cause an increase or decrease in the Contractor's cost of, and/or time required for, performance of the Contract, an equitable adjustment shall be made and confirmed in writing in a Change Order.

9.2 CHANGE ORDERS

A Change Order is a written order to the Contractor, signed by the Owner and issued after execution of the Contract, authorizing a change in the Work and/or an adjustment in the Contract Sum and/or the Contract Time. The Contract Sum and the Contract Time may be changed only by Change Order. A Change Order signed by the Contractor indicates the Contractor's agreement therewith, including the adjustment in the Contract Sum and/or the Contract Time.

It is recognized by the parties hereto and agreed by them that the Specifications and Drawings may or may not be complete or free from errors, omissions and imperfections or require changes or additions in order for the Work to be completed in accordance with the Contract Documents and to the satisfaction of Owner and that, accordingly, it is the express intention of the parties, notwithstanding any other provisions in this Contract, that any errors, omissions or imperfections in such Specifications and Drawings or any changes in or additions to same or to the Work ordered by Owner and any resulting delays in the Work or increases in Contractor's costs and expenses, shall not constitute or give rise to
any claim, demand or cause of action of any nature whatsoever in favor of Contractor, whether for breach of contract, quantum meruit, or otherwise; provided, however, that Owner shall be liable to Contractor for the sum stated to be due Contractor in any Change Order approved and signed by both parties, it being agreed hereby that such sum, together with any extension of time contained in said Change Order, shall constitute full compensation to Contractor for all costs, expenses and damages to Contractor, whether direct, consequential or otherwise in any ways incident to, arising out of, or resulting directly or indirectly from the Work performed by Contractor under such Change Order.

9.3 CHANGE ORDER CONTRACT SUM ADJUSTMENTS

Adjustments in the contract price for Work covered by a Change Order shall be computed on the basis of one or more of the following procedures. The Contractor shall have a maximum time of fourteen (14) calendar days to submit change order pricing, unless otherwise directed by the Owner.

9.3.1 Unit Prices: Unit prices as stated in the Contract Documents or subsequently mutually agreed upon by the Owner and the Contractor for the increase or reduction in the Work or portion thereof.

Unit prices shall be inclusive of all costs and shall be applied to units of measure as defined in the Contract Documents for each category of Work.

9.3.2 Lump Sum: A lump sum agreed upon by the Owner and Contractor based on an estimated cost of the increase or reduction in the Work properly itemized and supported by sufficient substantiating data to permit evaluation.

9.3.3 Actual Cost: The actual cost of the Work as determined from job records after the completion of the extra Work. For Work done under this paragraph, the Contractor shall maintain and submit to the Owner for review and approval as directed by the Owner, accurate accounts of all costs and supporting data. There shall be a lump sum cost-not-to-exceed agreed upon by the Owner and Contractor before this provision is used.

9.3.4 Net Cost of Increase or Reduction in the Work: The net cost of the estimated or actual cost of the Work shall be the actual or prorated cost of:

9.3.4.1 Labor at the prevailing rate of wages and fringe benefits.

9.3.4.2 Materials entering permanently into the Work, including delivery to the site.

9.3.4.3 The ownership or rental cost of construction equipment at actual cost, prorated for the time necessary for the Work.

9.3.4.4 Power and consumable supplies for the operation of power equipment at actual cost, prorated for the time necessary for the Work.

9.3.4.5 Insurances and bonds only when supported by paid invoice.

9.3.4.6 When a change in the Work includes a category or categories of Work both added to and deleted from the Contract, the total quantities of added Work and of deleted Work shall be determined separately for each category and the appropriate Unit Price or net cost of the Work shall be the difference between the two total quantities.

9.3.5 Gross Cost of Increase or Reduction in the Work: The gross cost to the Owner for the estimated or the actual cost of the Work performed by the Contractor shall include the net cost of the Work to the Contractor plus an allowance for overhead and profit. The Contractor will be allowed a maximum markup for overhead and profit of 15% on labor only. The Contractor will be allowed a maximum markup for overhead and profit of 10% on material and equipment (not including sales tax). Markup on sales tax is not permitted.

The gross cost to the Owner for the estimated or actual cost of the Work performed by a Subcontractor shall include the net cost of the Work to the Subcontractor plus an allowance for overhead and profit. The Subcontractor will be allowed a maximum markup for
overhead and profit of 15% on labor only. The Subcontractor will be allowed a maximum markup for overhead and profit of 10% on material and equipment (not including sales tax). Markup on sales tax is not permitted. The Contractor will be allowed overhead and profit not to exceed 10% of the Subcontractor's cost.

9.3.6 If no mutual agreement can be reached between the Owner and the Contractor as to the method to complete the Work covered by a Change Order, the change in the Contract Price, if any, shall then be determined on the basis of the reasonable expenditures or savings of those performing, deleting, or revising the Work attributable to the change. In such case, the Contractor shall prepare, in such form and with such contents and details as the Owner requires, an itemized accounting of such expenditures or savings, plus appropriate supporting data for inclusion in a Change Order. Reasonable expenditures or savings shall be limited to the following: reasonable costs of materials, supplies, or equipment, including delivery costs; reasonable costs of labor and fringe benefits required by agreement or custom; reasonable rental or Owner costs of machinery and equipment exclusive of hand tools whether rented from the Contractor or others; actual costs of premiums for all bonds and insurance only when supported by paid invoice specific to change, permit fees, and sales, use, or other taxes related to the Work. In no event shall any expenditure or savings associated with the Contractor's home office or other non-job site overhead expense be included in any change in the Contract Price. Allowance for overhead and profit shall be determined in accordance with Subparagraph 9.3.5.

9.3.7 If a Change Order submission is rejected and the work is considered part of the Contract Price by the Professional and Owner, work shall be considered a claim to the Contract. Pending final resolution of a Claim, unless otherwise agreed in writing, the Contractor shall proceed diligently with performance of the Contract. If the Contractor refuses to complete the work the Owner may proceed in accordance with Subparagraph 8.9.2.

9.3.8 Mark-up for overhead and profit on bond premium increases due to Change Orders is not allowed.

9.4 CHANGE ORDER CONTRACT TIME ADJUSTMENTS

Adjustments in the time required for performance of the Contract for Work covered by a Change Order shall be as agreed upon by the Owner and the Contractor as part of the Change Order. If the parties are unable to agree on the time extension or reduction, the Professional shall make a determination of the time extension or reduction to be allowed for a change.

9.5 MINOR CHANGES IN THE WORK

The Professional, with the Owner's approval, will have authority to order minor changes in the Work not involving an adjustment in the Contract Sum or an extension of the Contract Time. Such changes will be effected by written order which the Contractor shall carry out promptly.

9.6 NOTICE TO SURETY: CONSENT

The Contractor shall notify and obtain the consent and approval of the Contractor's surety with reference to all Change Orders if such notice, consent or approval are required by the Contractor's surety or by law. The Contractor's execution of the Change Order shall constitute the Contractor's warranty to the Owner that the surety has been notified of and consents to such Change Order, and the surety shall be conclusively deemed to have been notified of such Change Order and to have expressly consented thereto.

9.7 EFFECT OF EXECUTED CHANGE ORDER

The execution of a Change Order by the Contractor shall constitute conclusive evidence of the Contractor's agreement to the ordered changes in the Work, this Contract as thus amended, the Contract Price and the Contract Time. The Contractor, by executing the Change Order, waives and forever releases any claim against the Owner for additional time or compensation for matters relating to or arising out of or resulting from the Work included within or affected by the executed Change Order.
ARTICLE 10 - CONTRACT COMPLETION TIME

10.1 NOTICE TO PROCEED

The Contract Time will begin on the date designated in the Notice to Proceed issued by the Owner and the Contractor is required to complete the Work in the time stated therein and in the Agreement.

10.2 PROGRESS AND COMPLETION

Time limits stated in the Contract Documents are of the essence of the Contract. By executing the Agreement the Contractor confirms that the Contract Time is a reasonable period for performing the Work.

The Contractor shall proceed expeditiously with adequate forces and shall achieve Substantial Completion within the Contract Time.

10.3 DELAYS AND EXTENSIONS OF TIME

If the Contractor is delayed at any time in progress of the Work by an act or neglect of the Owner or Professional, or of an employee of either, or of a separate Contractor employed by the Owner, or by changes ordered in the Work, or by labor disputes, fire, unavoidable casualties or other causes beyond the Contractor's control, or by delay authorized by the Owner, or by other causes which the Professional determines may justify delay, then the Contract Time shall be extended by Change Order for such reasonable time as the Professional may determine with the Owner's approval.

Claims relating to time shall be made in accordance with applicable provisions of Subparagraph 7.5.

This Paragraph 10.3 does not preclude recovery of damages for delay by the Owner under other provisions of the Contract Documents.

Apart from extension of time, no payment or claim for damages shall be made to the Contractor as compensation for damages for any ordinary delays or hindrances from any cause whatsoever in the progress of the Work, notwithstanding whether such delay be avoidable or unavoidable.

10.4 COMPLETION AND LIQUIDATION DAMAGES

The Contractor shall substantially complete all of the Work included in the Contract Documents ready for the Owner's use and occupancy, in the Contract Time noted in the Contractor's Form of Proposal and the Agreement subject to extensions of Contract Time as provided in Paragraph 10.3 above. Pursuant to the provisions of Paragraph 10.4, for each calendar day's delay in said completion, the Contractor shall pay to the Owner as liquidated damages, and not as a penalty, the sum in the amount noted in the Project Manual and the Agreement. The Contractor and its surety shall be liable for the amount thereof.

Any delay attributable to lack of coordination or cooperation by or between the Contractor and its Subcontractor(s) will not be recognized by the Owner as the basis for any claim for increase in the Contract Sum or Contract Time.

10.5 SUBSTANTIAL COMPLETION

When the Contractor considers that the Work, or a portion thereof which the Owner wishes or agrees to accept separately, is substantially complete in accordance with Paragraph 1.15, the Contractor shall prepare for submission to the Professional and the Owner a list of items to be completed or corrected. The failure to include any items on such list does not alter the responsibility of the Contractor to complete all Work in accordance with the Contract Documents. When the Professional and the Owner, on the basis of an inspection, determine that the Work is substantially complete, the Professional or Owner will then prepare a Substantial Completion Inspection Report which shall establish the Date of Substantial Completion; shall state the responsibilities of the Owner and the Contractor for maintenance, heat, utilities, operation of permanent equipment, warranty and insurance; and shall fix the time within which the Contractor shall complete the items listed therein. The Substantial Completion Inspection Report shall be submitted to the Contractor as their notification of the responsibilities assigned to each of them.
The Contractor shall be charged with any cost for reinspection resulting from substantial differences between the Contractor’s list of items to be completed or corrected and the list of items resulting from the Professional and Owner’s inspection.

10.6 PARTIAL OCCUPANCY

The Owner may take occupancy or make use of any substantially completed portion of the Work at any stage.

The procedures for the preparation of a list of items to be completed or corrected, Partial Occupancy Inspection and Inspection Reports are to be followed as outlined in Paragraph 10.5 above.

The Contractor agrees that the Owner may place and install as much material, equipment and furnishings as is possible during construction without interfering with orderly progress of the Work and prior to use and occupancy of the various parts of the Work, and further agrees that such placing and installation shall not evidence completion of the Work or signify the Owner’s acceptance of the Work or any part thereof.

Partial occupancy or use of a portion or portions of the Work shall not constitute acceptance of Work not complying with the requirements of the Contract Documents.

ARTICLE 11 - PAYMENTS AND COMPLETION

11.1 SCHEDULE OF VALUES

Upon execution of the Agreement between the Owner and the Contractor, the Contractor shall submit to the Professional for approval, a breakdown of the Contract price itemizing material and labor for the various classifications of the Work. The breakdown will be used as the basis for the progress payments of the Contract.

The schedule shall be tabulated into subcontracts and trades, for each of which the Quantity, Labor, Material, Other Cost and resulting final Cost per Unit shall be indicated. Labor, Material, Other Cost, Cost per Unit and Quantity generally include but are not necessarily limited to the following:

11.1.1 Quantity: Total number of items for each portion or Unit of Work as determined from the Contract Documents.
11.1.2 Labor: On-site labor required for the handling and installation of material from point of delivery at site.
11.1.3 Material: Cost of material as delivered to site for installation and erection.
11.1.4 Other Costs: Rental equipment, depreciation, site office, administration, overhead and profit, testing, survey and layout, samples and other costs not included in Labor and Material.
11.1.5 Cost per Unit: Total of Labor, Material and Other Cost for each portion or Unit of Work derived from the total Quantity of same.

The Contractor’s monthly application for payment shall reflect the same items as outlined above. Unit costs shall be realistic for their part of the Work.

11.2 APPLICATIONS FOR PAYMENT

Except as otherwise agreed in writing by the parties, and except for any amounts withheld or disallowed due to deficiencies or errors in documentation as defined in Paragraph 11.5 below, payment of progress and final payment applications shall be due from the Owner forty-five (45) days after the end of a billing period or forty-five (45) days after delivery of the Application for Payment, whichever is later.

Within ten (10) calendar days of the effective date hereof, the Contractor shall submit to the Owner and to the Professional a Schedule of Values allocating the Contract Price to the various portions of the Work. The Contractor's Schedule of Values shall be prepared in such form, with such detail, and supported by such data as the Professional or the Owner may require to substantiate its accuracy. The Contractor
shall not imbalance its Schedule of Values nor artificially inflate any element thereof. The violation of this provision by the Contractor shall constitute a material breach of this Contract. The Schedule of Values shall be used only as a basis for the Contractor’s Applications for Payment and shall only constitute such basis after it has been acknowledged in writing by the Professional and the Owner.

Ten (10) days before the date established for each progress payment submittal to the Owner, the Contractor shall submit to the Professional an itemized Application Certificate of Payment for construction activities completed in accordance with the approved Schedule of Values and which shall reflect the appropriate retainage as outlined.

Such application shall be supported by such data substantiating the Contractor’s right to payment as the Owner may require, including weekly payroll certification (Commonwealth of Pennsylvania Department of Labor and Industry form LIPW-126) if applicable.

Such applications may include requests for payment on account of changes in the Work which have been properly authorized by Change Order and fully executed.

Such applications shall not include requests for payment of amounts the Contractor does not intend to pay to a Subcontractor or material supplier because of a dispute or other reason.

The Contractor warrants that title to all Work covered by an Application Certificate of Payment will pass to the Owner at the time of payment. The Contractor further warrants that upon submittal of an Application Certificate of Payment all Work for which Certificates of Payment have been previously issued and payments received from the Owner shall be free and clear of liens, Claims, security interests or encumbrances in favor of the Contractor, Subcontractors, material suppliers, or other persons or entities making a Claim by reason of having provided labor, materials and equipment relating to the Work.

This provision shall not be construed as relieving the Contractor from the sole responsibility for the care and protection of materials and Work upon which payments have been made or the restoration of any damaged Work, or as a waiver of the right of the Owner to require the fulfillment of all of the terms of the Contract.

Payments to the Contractor shall not be construed to release the Contractor or its surety from any obligations under this Contract.

A Certificate of Payment, a progress payment, or partial or entire use or occupancy of the Project by the Owner shall not constitute acceptance of Work not in accordance with the Contract Documents.

11.3 PAYMENTS FOR STORED MATERIAL

Payments on account of materials or equipment not incorporated in the Work but delivered and suitably stored at the site, or at some other location agreed upon in writing, will be made by the Owner subject to the following conditions:

11.3.1 Such materials or equipment shall have been fabricated or assembled specifically for the Project and delivered to storage no earlier than needed for the orderly progress of the Work as demonstrated by the Progress Schedule.

11.3.2 Title to such materials or equipment shall pass to the Owner pursuant to the Contractor’s bill of sale which shall contain a guarantee of replacement thereof in the event of damage thereto or disappearance thereof due to any cause. Payment by the University for stored material will be made only upon receipt of the Contractor’s paid-in-full invoice from the manufacturer or supplier.

11.3.3 In the case of off-site storage, the Contractor shall also provide consent of Surety to such payment and insurance of such materials or equipment against the perils set forth in Paragraph 3.3, both while in storage and during transportation to the site.

11.3.4 Raw materials or other materials or equipment readily duplicated or usable on other projects will be paid for only after the materials are incorporated into the Project.

11.3.5 Any other documentation as requested by the Owner.

01/2009

GC, Page 31 of 37
11.4 CERTIFICATES OF PAYMENT

Based on observations of the Work, the Professional, will either recommend, within seven (7) days (except as otherwise provided in Paragraph 11.5.8 below) after receipt from the Contractor, approval of payment on the Application Certificate of Payment or notify the Contractor and Owner in writing of the Professional's reason(s) for withholding its recommendation in whole or in part as provided in Paragraph 11.5 below.

The Professional shall mark the Certificate of Payment so as to indicate the disapproval of those items for which payment is to be withheld or disallowed and to indicate the corrected values, and shall forward the Certificate of Payment to the Owner for further processing, except that, should the Professional disapprove payment of the entire progress payment, the disapproved Certificate of Payment will be returned to the Contractor, with notification of said return provided to the Owner by the Professional. Approval of the Certificate of Payment shall constitute a representation by the Professional to the Owner that the Work has progressed to the point indicated on the Application, and that to the best of the Professional's knowledge, information and belief, the quality of the Work is in accordance with the Contract Documents.

The foregoing representations are subject to an evaluation of the Work for conformance with the Contract Documents upon Substantial Completion, to results of subsequent tests and inspections, to minor deviations from the Contract Documents correctable prior to completion and to specific qualifications expressed by the Professional. The issuance of a Certificate of Payment will further constitute a representation that the Contractor is entitled to payment in the amount certified. However, the issuance of a Certificate of Payment will not be a representation that the Professional has (1) made exhaustive or continuous on-site inspections to check the quality and quantity of the Work, (2) reviewed construction means, methods, techniques, sequences or procedures, (3) reviewed copies of requisitions received from Subcontractors and material suppliers and other data requested by the Owner to substantiate the Contractor's right to payment or (4) made examination to ascertain how or for what purpose the Contractor has used money previously paid on account of the Contract Sum. Upon Substantial Completion of the Work and upon written request of the Contractor, certification by the Professional and approval of the Owner, retainage for the uncompleted portion of the Work may be reduced to a percentage mutually agreed upon by all parties.

11.5 WITHHOLDING OF PAYMENT

The Professional or the Owner may decline to make payment, may withhold funds, and if necessary, demand the return of some or all of the amounts previously paid to the Contractor or nullify that part of any Application Certificate of Payment to such extent as may be necessary to protect the Owner from loss because of any of the following:

11.5.1 Defective Work not yet remedied by the Contractor or defective work, in the opinion of the Owner, not likely to be remedied by the Contractor.

11.5.2 Third party claims filed or reasonable evidence indicating probable filing of such claims.

11.5.3 Failure of the Contractor to make payments promptly and properly to Subcontractors or others.

11.5.4 Any evidence that the Work cannot be completed for the unpaid balance of the Contract Sum.

11.5.5 Damage to the Owner, another Contractor, or any third party.

11.5.6 Any evidence that the Work will not be completed within the Contract Time, and that the unpaid balance would not be adequate to cover actual or liquidated damages for the anticipated delay.

11.5.7 Failure to carry out the Work in accordance with the Contract Documents.

11.5.8 Errors in Documentation: If a Certificate of Payment is filled out incorrectly or incompletely, or if there is any other defect or improperity in a Certificate of Payment, the Professional or Owner shall give written notice to the Contractor within ten (10) working days after receipt.
of the Certificate, and the Owner shall make payment for the correct amount to the Contractor provided the Certificate of Payment is approved by the Professional in accordance with this Agreement.

11.5.9 Lack of required submissions as outlined in the General Conditions of the Contract.

If the Contractor and Professional cannot agree on a revised amount, the Professional will promptly issue a Certificate of Payment for the amount which the Professional is able to recommend to the Owner.

When the above reason(s) for withholding recommendation or nullifying any part of a Certificate of Payment are removed, recommendation and payment will be made for amounts previously withheld.

11.6 PAYMENTS TO SUBCONTRACTORS

Upon receipt of payment from the Owner, the Contractor shall promptly pay each Subcontractor, out of the amount paid to the Contractor the amount to which said Subcontractor is entitled, reflecting percentages actually retained from payments to the Contractor on account of such Subcontractor’s portion of the Work. The Contractor shall, by appropriate agreement with each Subcontractor, require each Subcontractor to make payments to Sub-subcontractors in similar manner.

The Professional or Owner will, on request, furnish to a Subcontractor, if practicable, information regarding percentages of completion or amounts applied for by the Contractor and action taken thereon by the Professional and Owner on account of portions of the Work done by such Subcontractor.

Neither the Owner nor Professional shall have an obligation to pay or to see to the payment of money to a Subcontractor.

Payment to material suppliers by the Contractor shall be treated in a manner similar to that provided above.

11.7 FAILURE OF PAYMENT

If the Professional does not recommend approval of payment, through no fault of the Contractor, within fourteen (14) days after receipt of the Contractor’s Application of Payment, or if the Owner does not pay the Contractor within a reasonable time the amount certified by the Professional, then the Contractor may, upon seven (7) additional days’ written notice to the Owner and Professional, stop the Work until payment of the amount owing has been received. The Contract Time shall be extended appropriately and the Contract Sum shall be increased by the amount of the Contractor’s reasonable costs of shutdown, delay and start-up, which shall be accomplished as provided in Article 9.

11.8 FINAL COMPLETION AND FINAL PAYMENT

11.8.1 Notification: When the Work is completed, the Contractor shall notify the Professional and Owner in writing that the Work will be ready for final inspection on a definite date. Upon verification by the Professional that the Work is ready for final inspection and acceptance, the Professional and Owner will make a final inspection and, when the Work is found acceptable under the Contract Documents and the Contract is fully performed, the Owner will make final payment to the Contractor.

11.8.2 Final Payment Documentation: The final payment for the remaining retained percentage shall not become due until the Contractor submits to the Professional for transmittal to the Owner (1) an affidavit that all payrolls, bills for materials and equipment, and other indebtedness connected with the Work for which the Owner or the Owner’s property might in any way be responsible, have been paid or will be paid or otherwise satisfied within thirty (30) days after receipt of final payment from the Owner, (2) consent of surety to final payment, (3) Certificate of Completion and Release of Liens, (4) MBE/WBE participation data, (5) OSHA recordable accident data, (6) construction waste management documentation, and (7) all maintenance manuals, as-built drawings and warranty certificates that may be required. If any third party fails or refuses to provide a release of claim or waiver of lien as required by Owner, the Contractor shall furnish a bond satisfactory to the Owner to indemnify the Owner from liability.
11.8.3 Final Payment: Acceptance of final payment by the Contractor shall constitute a waiver of all claims by the Contractor except those specifically enumerated in writing previously and identified in writing as unsettled at the time of final payment.

The making of final payment shall constitute a waiver of claims by the Owner except those arising from any of the following:

11.8.3.A Liens, Claims, security interests or encumbrances arising out of the Contract and unsettled.

11.8.3.B Failure of the Work to comply with the requirements of the Contract Documents.

11.8.3.C Terms of special warranties required by the Contract Documents.

ARTICLE 12 - CONTRACT WARRANTY PERIOD

12.1 WARRANTY

Except as otherwise specified, the Contractor warrants and guarantees all Work against defects in materials, equipment and/or workmanship for a period of one (1) year from the date of Substantial Completion of the entire Project or Partial Occupancy of any portion thereof and for that period of time noted in any special or extended warranty.

This period of one (1) year shall be extended with respect to portions of the Work first performed after Substantial Completion by the period of time between Substantial Completion and the actual performance of the Work.

If building commissioning work is not complete at the time of substantial completion, the warranty period for all related building systems may be extended by the Owner. Documentation by the Owner shall be submitted at the time of substantial completion indicating the building systems not yet properly commissioned. Once the building systems have been completed to the satisfaction of the Owner, a letter will be issued by the Owner indicating the listing of building systems and equipment with the revised warranty period. The Contractor’s warranty excludes remedy for damage or defect caused by abuse, modifications not executed by the Contractor, Improper or insufficient maintenance, improper operation or normal wear and tear under normal usage.

This warranty and guarantee is not the exclusive remedy of the Owner but is in addition to the general obligation of the Contractor to faithfully perform the Contract, and it in no way limits the responsibility of the Contractor for faulty materials or workmanship.

12.2 CORRECTION OF DEFECTS

Upon receipt of written or verbal notice from the Owner or Professional of the discovery of any defects in materials, equipment and/or workmanship, the Contractor shall remedy the defects and replace any property damaged therefrom occurring within the warranty and guarantee period. Any defects discovered in materials, equipment and/or workmanship which are included in any manufacturer’s written warranty certificate shall be remedied in accordance with the manufacturer’s recommendations and procedures.

If any of the Work is found to be not in accordance with the requirements of the Contract Documents, including substitutions not properly approved and authorized, such Work will be considered defective and shall be corrected promptly by the Contractor after receipt of notice from the Owner or Professional.

If the Contractor, after notice, fails to proceed promptly and remedy such defects within thirty (30) days or within another period of time which has been agreed to in writing, in compliance with the terms of the warranty and guarantee, the Owner may have the defects corrected and the Contractor and its surety shall be liable for all expenses incurred.

12.3 ONE-YEAR INSPECTION

Prior to the expiration of the one (1) year guarantee period against defective materials, equipment and/or workmanship, the Professional and Owner shall conduct an inspection to determine any other defects in
material, equipment and/or workmanship not previously noticed and corrected as outlined in Paragraph 12.2 above.

Should any additional defects be discovered, the Contractor, upon receipt of written notice from the Professional or Owner, shall promptly remedy the defects and replace any property damaged therefrom.

If the Contractor, after notice, fails to proceed promptly and remedy such defects within thirty (30) days or within another period of time which has been agreed to in writing, in compliance with the terms of the warranty and guarantee, the Owner may have the defects corrected and the Contractor and its surety shall be liable for all expenses incurred.

ARTICLE 13 - EQUAL EMPLOYMENT OPPORTUNITY

13.1 NON-DISCRIMINATION CLAUSE

During the term of this Contract, Contractor agrees as follows:

13.1.1 Contractor shall not discriminate against any applicant for employment or any independent Contractor or any other person because of race, color, religious creed, ancestry, national origin, age, or sex. Contractor shall not discriminate against any employee or independent Contractor or other person because of race, color, religious creed, ancestry, national origin, age, or sex.

Contractor shall take affirmative action to ensure that applicants are employed, and that employees or agents are treated during employment, without regard to their race, color, religious creed, ancestry, national origin, age, or sex. Such affirmative action shall include, but is not limited to, the following: Employment upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training.

Contractor shall post in conspicuous places, available to employees, agents, applicants for employment and other persons, notices to be provided by the contracting agency setting forth the provisions of this non-discrimination clause.

13.1.2 Contractor shall in solicitations or advertisements placed by it or on its behalf state all qualified applicants will receive consideration for employment without regard to race, color, religious creed, ancestry, national origin, age, or sex.

13.1.3 Contractor shall send each labor union or workers’ representative with which it has a collective bargaining agreement or other contract or understanding, a notice advising said labor union or workers’ representative of its commitment to this non-discrimination clause and shall post copies of the notice in conspicuous places available to employees and applicants for employment. Similar notices shall be sent to every other source of recruitment utilized by Contractor.

13.1.4 It shall be no defense to a finding of a non-compliance with Executive Order 1972-1 or any regulations issued by the Pennsylvania Human Relations Commission or this non-discrimination clause that recipient had delegated some of its employment practices to any union, training program or other source of recruitment which prevents it from meeting its obligations.

13.1.5 Where the practices of a union or any training program or other source of recruitment will result in the exclusion of minority group persons, so that Contractor will be unable to meet its obligations under Executive Order 1972-1 or any regulations issued by the Pennsylvania Human Relations Commission or this non-discrimination clause, the Contractor shall then employ and fill vacancies through other employment procedures without regard to race, color, religious creed, ancestry, national origin, sex, or age, taking affirmative action to obtain qualified minority group persons.

13.1.6 Contractor shall comply with all rules, regulations and orders issued by the Governor, the Attorney General, and the Human Relations Commission relating to laws, prohibiting discrimination in hiring or employment opportunities. In the event of Contractor’s non-compliance with the non-discrimination clause of this Contract or with any such rules, regulations or orders, this Contract may be cancelled, terminated or suspended in whole or
in part, and recipient may be declared ineligible for further Commonwealth contracts, and such other sanctions may be imposed and remedies invoked as provided by rule, regulation or order of the Governor, Attorney General, or the Human Relations Commission, or as otherwise provided by law.

13.1.7 Contractor shall furnish all information and reports required by the Governor, Attorney General, and the Human Relations Commission and will permit access to its books, records and accounts by the contracting agency and the Human Relations Commission, for purposes of investigation to ascertain compliance with provisions of Executive Order 1972-1 or any regulations issued by the Pennsylvania Human Relations Commission or this non-discrimination clause.

13.1.8 Contractor shall actively recruit minority Subcontractors or Subcontractors with substantial minority representation among their employees.

13.1.9 Contractor shall include the provisions of Paragraphs 13.1.1 through 13.1.10 in every Subcontract or Purchase Order, so that such provisions will be binding upon each Subcontractor or vendor or other person.

13.1.10 The terms used in this non-discrimination clause shall have the same meaning as in the Contract Compliance Regulations issued by the Pennsylvania Human Relations Commission, 16 Pa. Code Ch. 49.

ARTICLE 14 - MISCELLANEOUS PROVISIONS

14.1 RIGHTS AND REMEDIES

Duties and obligations imposed by the Contract Documents and rights and remedies available thereunder shall be in addition to and not a limitation of duties, obligations, rights and remedies otherwise imposed or available by law.

No actions or failure to act by the Owner, Professional or Contractor shall constitute a waiver of a right or duty afforded them under the Contract, nor shall such action or failure to act constitute approval of or acquiescence in a breach thereunder, except as may be specifically agreed in writing.

14.2 INDEMNIFICATION

To the fullest extent permitted by law, the Contractor shall appear for and defend, indemnify, and hold harmless the Owner, Professional, Professional's consultants, and agents and employees of any of them from and against claims, damages, losses, and expenses, including but not limited to attorneys' fees, arising out of or resulting from performance of the Work, of whatsoever nature caused in whole or in part by the Contractor, a Subcontractor, anyone directly or indirectly employed by them or anyone for whose acts they may be liable, regardless of whether or not such claim, damage, loss, or expense is caused in part by a party indemnified hereunder. Such obligation shall not be construed to negate, abridge, or reduce other rights or obligations of indemnity which would otherwise exist as to a party or person described in this Paragraph 14.2.

In claims against any person or entity indemnified under this Paragraph 14.2 by an employee of the Contractor, a Subcontractor, anyone directly or indirectly employed by them or anyone for whose acts they may be liable, the Indemnification obligation under this Paragraph 14.2 shall not be limited by a limitation on amount or type of damages, compensation or benefits payment by or for the Contractor or a Subcontractor under workers' or workmen's compensation acts, disability benefit acts or other employee benefit acts.

The obligations of the Contractor under this Paragraph 14.2 shall not extend to the liability of the Professional, the Professional's consultants, and agents and employees of any of them arising out of (1) the preparation or approval of maps, drawings, opinions, reports, surveys, Change Orders, designs or specifications, or (2) the giving of or the failure to give directions or instructions by the Professional, the Professional's consultants, and agents and employees of any of them, provided such giving or failure to give is the primary cause of the injury or damage.

The status of the Contractor in the Work to be performed by it under this Contract is that of an Independent Contractor and as such the Contractor shall properly safeguard against any and all personal
injury including death, or damage to the public, to public and private property, materials, and things; and as such, the Contractor alone shall be responsible for any and all damage, loss, or injury to persons or property that may arise or be incurred in or during the conduct or progress of said Work without regard to whether or not the Contractor, its Subcontractors, Agents, or Employees have been negligent; and the Contractor shall keep the Owner and Professional indemnified from and discharged of and from any and all responsibility and liability for risks and casualties of every description, as provided in the Agreement between the Owner and the Contractor.

GENERAL CONDITIONS OF THE CONTRACT: JANUARY 2009
SECTION D1
NOTIFICATION OF CONTRACT REQUIREMENTS PERTAINING TO THE PREVAILING WAGE ACT

1. The Contractor shall pay no less than the wage rates as determined in the decision of the Secretary of Labor and Industry and shall comply with the conditions of the Pennsylvania Prevailing Wage Act approved August 15, 1961 (Act No. 442), as amended August 9, 1963 (Act No. 342), and the Regulations issued pursuant thereto, to assure the full and proper payment of said rates.

2. Such workmen shall be paid no less than such general prevailing minimum wage rates and such other provisions to assure payment thereof as heretofore set forth in this Section.

3. The Contract provisions shall apply to all work performed on the Contract by the Contractor and to all work performed on the Contract by all Subcontractors.

4. The Contractor shall insert in each of its subcontracts all of the stipulations contained in these required provisions and such other stipulations as may be required.

5. No workmen may be employed on the public work except in accordance with the classifications set forth in the decisions of the Secretary. In the event that additional or different classifications are necessary, the procedure set forth in Section 7 of these Regulations shall be followed.

6. All workmen employed or working on the public work shall be paid unconditionally, regardless of whether any contractual relationship exists or the nature of any Contractor, Subcontractor and workmen, not less than once a week without deduction or rebate, on any account, either directly or indirectly, except authorized deductions, the full amounts due at the time of payment, computed at the rates applicable to the time worked in the appropriate classification. Nothing in the Contract, the Act, or these Regulations shall prohibit the payment of more than the general prevailing minimum wage rates as determined by the Secretary to any workman on public work.

7. The Contractor and each Subcontractor shall post for the entire period of construction the wage determination decisions of the Secretary, including the effective date of any changes thereof, in a prominent and easily accessible place or places at the site of the work and at such a place or places used by them to pay workmen their wages. The posted notice of wage rates must contain the following information:
   a. Name of project.
   b. Name of public body of which it is being constructed.
   c. The crafts and classifications of workmen listed in the Secretary's general prevailing minimum wage rate determinations for the particular project.
   d. The general prevailing minimum wage rates determined for each craft and classification and the effective date of any changes.
   e. A statement advising workmen that if they have been paid less than the general prevailing minimum wage rate for their job classification or that the Contractor and/or Subcontractor are not complying with the Act or these Regulations in any manner whatsoever, they may file a protest with the Secretary of Labor and Industry. Any workmen paid less than the rate specified in the Contract shall have a civil right of action for the difference between the wage paid and the wages stipulated in the Contract, which right of action must be exercised within six (6) months from the occurrence of the event creating such right.
8. The Contractor and all Subcontractors shall keep an accurate record showing the name, craft and/or classification, number of hours worked per day, and the actual hourly rate of wage paid (including employee benefits) to each workman employed by him in connection with the public work, and such record must include any deductions from each workman. The record shall be preserved for two years from the date of payment and shall be open at all reasonable hours to the inspection of the public body awarding the contract and to the Secretary or his duly authorized representative.

9. Apprentices shall be limited to such numbers as shall be in accordance with a bona fide apprenticeship program registered with and approved by the Pennsylvania Apprenticeship and Training Council, and only apprentices whose training and employment are in full compliance with the provisions of the Apprenticeship and Training Act approved July 14, 1961 (Act No. 304), and the Rules and Regulations issued pursuant thereto shall be employed on the public work project. Any workman using the tools of a craft who does not qualify as an apprentice within the provisions of this Subsection shall be paid the rate predetermined for journeymen in that particular craft and/or classification.

10. Wages shall be paid without any deductions except authorized deductions. Employers not parties to a contract requiring contributions for employee benefits which the Secretary has determined to be included in the general prevailing minimum wage rate shall pay the monetary equivalent thereof directly to the workmen.

11. Payment of compensation to workmen for work performed on public work on a lump-sum basis, or a piecework system, or a price certain for the completion of a certain amount of work, or the production of a certain result shall be deemed a violation of the Act and these Regulations, regardless of the average hourly earnings resulting therefrom.

12. Each Contractor and each Subcontractor shall file a statement each week and a final statement at the conclusion of the work on the Contract with the contracting agency, under oath, and in form satisfactory to the Secretary, certifying that all workmen have been paid wages in strict conformity with the provisions and if any wages remain unpaid to set forth the amount of wages due and owing to each workman respectively.

13. The provisions of the Act and these Regulations shall be incorporated by reference in the Contract.

TAX INFORMATION

Per the PA Sales and Use Tax Regulation 150 (61 Pa Code SS31.11-SS31.16), Contractor is not required to pay sales tax or use tax on “building machinery and equipment” (or services to such property) which is transferred to The Pennsylvania State University an exempt entity, under this contract.

- Air Handling Units
- Fans
- HVAC Controls- Head End and Devices
- Fire Alarm System
- Chillers
- Boilers
- Grilles, Registers and Diffusers
- Dampers and Actuators
- Plumbing Fixtures
- Pumps
- Electrical Switchgear
- Electrical Panel boards
- Lighting Fixtures
- Fire Alarm- Head End and Devices
- Communication Equipment
- Public Affairs Equipment
- Casework and Furniture
- Louvers

Building machinery and equipment includes: boilers, chillers, air cleaners, humidifiers, fans, switch gear, pumps, telephones, speakers, horns, motion detectors, dampers, actuators, grills, registers, traffic signals, sensors, card access devices, guard rails, medical devices, floor troughs and grates, and laundry equipment together with integral coverings and enclosures. The term does not include guard rail posts, pipes, fittings, pipe supports and hangers, underground tanks, wire, conduit receptacles and junction boxes, insulation, duct work and coverings thereof.

Note: The above listing is to be used for informational purposes only. For specific determinations, contractors are encouraged to contact the Pennsylvania Department of Revenue directly.

The Pennsylvania State University will provide the appropriate documentation upon request for those building machinery and equipment items as listed above that are applicable to this contract and no sales or use tax is due on those items. Contractor, however, must pay sales tax when it purchases all other materials in this contract.

SECTION F [C]

GENERAL CONDUCT OF THE WORK AND SPECIAL REQUIREMENTS

General Project Description

The construction of a new 4 story (plus ground floor below grade) 93,915+/- SF mixed used office/classroom building. Construction is anticipated to occur over the duration of 22-23 months starting December 2010 to October 2012. This project includes the construction of a new 4 story (plus ground floor below grade) 93,915+/- SF mixed used office/classroom building, an underground lecture hall with a lawn terrace above, site work, demolition and abatement of the existing Henderson Bridge Building.

Construction features include cast in place basement walls, structural steel slab-on deck, brick/stone exterior, slate and vegetative roofing systems and curtain wall and storefront systems.

General Project Organization

OWNER: The Pennsylvania State University

ARCHITECT: Bohlin Cywinski Jackson

CONSTRUCTION MANAGER: Massaro CM Services, LLC

CONTRACTORS: The project is organized into the following bid packages and it is intended that prime contracts will be issued for these activities.

- Hazardous Material Abatement 800-290.HA1.1
- Demolition 800-290.BD2.1
- General Trades Work 800-290.GC3.1
- Fire Protection 800-290.5
- Plumbing 800-290.3
- HVAC 800-290.2
- Electrical 800-290.EL1.4
- Telecommunications 800-290.TL2.4
- Landscaping 800-290.LA4.1

Bids shall be based on any one of the specified products. Bidders shall not use a product contemplated for substitution to establish bidder's bid proposal price. Where one product only is named, such designation has been made in order to match existing products exactly or to otherwise suit the Owner's purposes.

The Construction Manager shall be responsible for the overall coordination process, control of the site, sequence of work and monitoring the progress of the work for all of the other Prime Contractors, Subcontractors and material suppliers involved in the project.

F-01 General

A. This section contains special instructions relating to the execution of the work shown on the drawings and required by the specifications, and is applicable to all Contracts.

B. Each Prime Contractor is required to provide a full time safety person/competent person on site trained to the level of achieving OSHA 30 hour certification. All
other supervision (project manager, engineers, superintendents and foremen) should be trained to a minimum level of OSHA 10 hour certification.

C. The project will have one construction entrance that will be paved from College Avenue to the main jobsite gate. It will be the responsibility of the General Trades prime contractor to clean and maintain the entrance road and entrance area at all times, this entrance may be shut down at any time by the construction manager if compliance is not maintained. Maintenance includes but is not necessarily limited to; snow removal, construction debris removal and general trash removal. (See attached Site Logistics Plan.)

D. A full time flagger employed by the Construction Manager will be stationed at the gate nearest College Avenue for pedestrian safety, traffic control and delivery verification and coordination.

E. Site access via truck will be limited to an overall height of 14’-0”.

F. Due to space and logistics limitations, only fully loaded trailer trucks will be allowed to enter the job site. Partial deliveries should be route through each Prime Contractor’s shop and delivered by smaller stake bed and pick-up trucks.

G. The construction entrance will include a truck/tire wash station to limit/eliminate all mud and debris on adjacent roadways. The wash station will be provided and maintained by the General Trades prime contractor for the project duration.

H. The Construction Manager will install, the site perimeter fence (as detailed on site logistics plan, fence fabric, initial tree protection, temporary walks, temporary construction road, and a stone base over fabric on all areas inside the construction fence and outside the building footprint/shored area. It is the responsibility of each Prime Contractor to maintain/replace to original the stone base/fabric after any excavation inside the construction fence.

I. It will be the responsibility of each Prime Contractor to backfill/replace (to original condition)/maintain/clean any site condition (concrete, asphalt, grass, landscaping, etc) disturbed during any work that takes place outside the construction fence. Daily cleaning is required. All necessary pedestrian or vehicle detour signage is the responsibility of the Prime Contractor doing the work and must be coordinated with Construction Manager and PSU.

J. All construction activity including demolition and hauling will occur during defined work periods. In general this work period starts at 7:00AM and concludes at 3:30PM. No workers or trades personnel will be permitted on site ½ hour prior to normal work periods or longer than ½ hour after normal work periods. Construction activity outside the normal work periods must be approved by the Construction Manager with a minimum of 48 hours notice.

K. Erosion and sedimentation will be governed by the NPDES permit submission. Comprehensive Erosion and Sediment Control documents are included in the construction documents and as such will be the responsibility of the General Trades Contractor to install and the General Trades Contractor to maintain. The General Trades Contractor will be a co-permittee to the NPDES Permit. All regulations required by the NPDES permit will be strictly enforced. These regulations control all construction activities and their potential impact on air and water quality and the containment of all sediment within the boundaries of the construction site.

L. It is the responsibility of each Prime Contractor to make sure their employees and subcontractors understand all job site rules and safety procedures and come to the
site prepared to complete their scheduled work with clear direction from the Prime Contractor on the scope of work to be performed, schedule, current drawings, specifications and sketches.

F-02 Definitions

A. Wherever the Contract Documents contain the terms “work,” “building,” “structure,” “project,” or words like import are used, it shall be understood to refer to and designate all construction materials and labor, complete and ready for use, within the limits of the contract lines as shown on the plot plan and specified.

B. “Provide” as used in the specification documents shall be understood to mean furnish and install complete and ready for use.

F-03 Project Coordination

A. The Construction Manager shall be responsible for the overall coordination, control, and progress of the work for all of the other Prime Contractors, Subcontractors, and material suppliers involved in the project.

B. The General Trades Contractor shall be responsible for preparing the progress schedule indicating the sequence and time required for the varied disciplines of the work. The progress schedule shall be submitted by the General Trades Contractor to the other Prime Contractors requesting their sequence and time requirement input. The Prime Contractors will be required to either approve the progress schedule submitted by the General Trades Contractor or give comments for correction.

After approval by all Prime Contractors, one progress schedule showing all disciplines shall be prepared. The completed progress schedule shall then be submitted to the Contraction Manager and Professional for review and approval. The approved progress schedule shall then be issued by the General Trades Contractor to all Prime Contractors, the Professional, and the University.

F-04 Project Meetings

A. Preconstruction Conference. Prior to commencement of the work, the Contractors shall meet in conference with representatives of the Owner and the Construction Manager, to discuss and develop mutual understanding, relative to administration of the project, general conduct of the work, progress schedules, safety programs, labor provisions, and other contract procedures relating to the work.

B. The Construction Manager shall provide a space to conduct a regularly scheduled, biweekly (every two weeks) meeting at the site for the purpose of coordinating the work. The Construction Manager shall require representation from all Prime Contractors and by any Subcontractors upon request of the Professional or the University.

C. Contractors shall attend personally or be represented at such meetings. Should the Contractor elect to be represented, it shall be understood and agreed that the University and the Professional, in dealing with contractor's representatives, do so with full assurance that such representative's actions and commitments may be accepted the same as though the contractor who signed, and is bound by the contract, were itself present and personally made such agreements or commitments.
D. The Professional shall take and retain a verbatim record of the biweekly meeting and shall prepare and distribute summary minutes of each meeting within four (4) days to the University, the Contractors, and all other interested parties. Any corrections to the minutes are to be sent to the Professional within four (4) working days after receipt of same.

E. Job meetings will be held at a predetermined day and time each week at the jobsite. Any and all coordination and schedule related issues will be discussed in these meetings. The Project Manager and superintendent/foreman of each company must attend these meetings regardless of the size of his crew on the project at that time.

F. Each superintendent will provide a two-week look-ahead schedule for review and coordination at the meeting. The schedule will show all activities individually, with start/end dates, show the activities critical path based on the overall schedule, and the activities durations in days.

G. In addition to weekly Construction Manager/Prime Contractor coordination meetings there will be bi-weekly CM/Owner/Architect meetings.

F-05 Order of Work

A. If in the judgment of the University, it becomes necessary at any time during construction to expedite the work or any part of it to conform with the approved project schedule, the Contractor shall cease work at any location, transfer its men to other locations, and execute other portions of the work as may be directed.

F-06 Parking for Contractors' Employees

A. Parking for one vehicle for each Prime Contractor will be provided at a designated area in the vicinity of the project site. The parking fee for these vehicles shall be established by the University's Parking Office. Each Contractor is advised to contact the Parking Office at (814) 865-1436 for rate information.

B. Parking for all other Contractor vehicles (either company-owned or employee-owned) will be provided in a parking lot designated by the University. The parking fee for these vehicles shall be established by the University's Parking Office. Each Contractor is advised to contact the Parking Office at (814) 865-1436 for rate information.

C. It will be each Contractor's responsibility to inform its employees that they cannot park at any location on the campus other than the assigned area. All existing University parking regulations shall be enforced.

D. Each Contractor shall arrange for transportation between the assigned parking area and the project site.

F-07 Unclassified Excavation

A. All excavation work will be unclassified and will include (without limitation thereto) the excavation and removal of all soil, shale, rock or rock formations, boulders, existing foundations, fill, and any type of subsurface condition encountered.

B. The University will consider no claims for extra compensation or extension of time because of the nature and subsurface conditions encountered.
F-08 Blasting

A. Because of experimental work being done in certain buildings on the campus and because laboratory equipment can be damaged or destroyed by unexpected vibrations due to blasting operations, it will be necessary for the Contractor doing blasting to conform to an established procedure which is in effect on the campus. It is not anticipated that blasting will be required on this project; however, should this event occur, the procedure will be made available to the Contractor.

F-09 Protection of Property

A. Protect all trees, shrubs, lawn areas, curbing, walks, roadways, and ground areas from damage during the course of the construction. Protect the existing structures and Contractors shall use care in the work in general in, on, and around the structures. Repair all damage to the satisfaction of the University at the responsible party's cost and expense.

F-10 Warning Lights

A. Where warning lights are required, they shall be the blinker type, battery or electrically operated. Open-flame-type torches are not permitted.

F-11 Access

A. Each Contractor shall maintain unobstructed pedestrian and automobile traffic lanes on the campus roads, service drives, and parking areas.

B. Protect existing buildings and structures from damage. Take all precautions to avoid damaging utilities.

C. The General Trades Contractor shall cover all stairs, treads, and risers, immediately after erection with heavy building paper, on top of which shall be placed boards, securely fastened in place, until project completion.

D. Each Contractor shall provide constant protection against rain, wind, storms, frost, or heat so as to maintain his work, materials, apparatus, and fixtures free from damage. At the end of each day's work, cover work likely to be damaged. During cold weather, protect work from damage by freezing and provide such enclosures and heating apparatus as may be necessary to prosecute the work without stoppage for reason of unfavorable weather.

E. Each Contractor, in all areas of operations, shall provide barricades, guard lights, and other appurtenances for the protection of workmen and public as required by applicable regulations and for the protection of roads, lighting, hydrants, walks, curbs, and adjacent grounds and planting for the duration of such operations. The Contractor shall bear the costs of damage caused by it and/or its Subcontractors.

F-12 Construction Fence

A. The Construction Manager will provide a construction fence enclosing the area of the work within the central limits. Construction fencing is also required for trailers and stored material that may be located outside the area of work. Fencing material should be adequate to protect persons and property.
1. Provide a six foot high (6') chain-link fence with galvanized frame and fabric, and adequate gates as required. Posts shall be 2 inch dia and spaced at maximum of 8 feet OC. Anchor posts in concrete footing. Footing shall be 10 inch diameter, with bottom at 36 inches below grade. Place tops of footing 3 inches below grade and cover with soil. Embed posts 24 inches in concrete. Provide top stabilizing rail between posts. Top of posts shall be closed.

2. Provide 5’–6” mesh fabric windscreen, mount top of fabric to top stabilizing bar. Fabric shall be PVC vinyl coated polyester, equal to Tenn-air curtain style, color US Open blue as manufactured by M. Putterman and Co., Inc. (800) 621-0146. Windscreen shall have reinforced hems and grommets every 12 inches on all edges. Install windscreen on construction side of fence, using 50-pound break strength tie wraps at every grommet. Pull fabric taught. (Optional: Penn State Logo shall be imprinted on windscreen facing the non-construction side of the fence at the request of the Project Manager.)

F-13  Temporary Facilities

A.  **Offices.** Contractor’s may erect a temporary office where directed. It shall be adequate in size for conducting the work. Size, quantity and location must be coordinated with the Construction Manager.

B.  **Sheds.** Contractor’s may provide and erect temporary sheds, as directed, for the storage of tools, equipment, and materials. Size, quantity and location must be coordinated with the Construction Manager.

C.  **Toilets.** The General Trades Contractor shall provide, erect, and maintain adequate toilet facilities for all Prime Contractors for the convenience of workmen and others employed on the work. The University and Construction Manager shall approve the type of facility and location. Toilet facilities maintenance should be completed twice a week for the duration of the project.

D.  **Scaffolding and Staging.** The Contractor shall furnish and erect all ladders, staging, and scaffolding required.

E.  **Design.** The University shall approve the design and appearance of offices, sheds, and toilets prior to erection.

F.  **Removal.** Prior to completion of the work, the Contractors shall completely remove the temporary buildings, offices, sheds, toilets, scaffolding, etc., and all other items of temporary facilities and construction provided by them, and restore the area to the original condition acceptable to the University.

G.  **Jobsite Hoisting:**
All hoisting of materials required for the performance of work shall be by each contractor. Install and operate in accordance with all safety regulations of authorities having jurisdiction. Use of crane lifts over any occupied building or area, or the general public is prohibited.

F-14  Existing Underground Utilities

A.  The existence and locations of underground utilities indicated on the drawings are not guaranteed. The Contractor shall investigate and verify in the field before starting any work.
B. All excavation within three (3) feet of any existing underground utility line shall be accomplished by hand labor. Extreme caution shall be used in this area to prevent any damage to existing facilities.

C. The Contractor shall adequately protect from damage (including shoring, if necessary), all underground utilities uncovered or exposed. The Contractor shall be responsible for all damage to existing underground utilities caused by its work and shall repair by a method approved by the University.

D. Utilities serving existing buildings, installation, or facilities shall not be interrupted until the Contractor has made the necessary arrangements with and has received approval from the University.

E. In the event that interruption of any existing utility service is necessary, the responsible Contractor shall be required to make all arrangements for shutdown and start-up of such service with the University representative.

F-15 Temporary Utility Services

A. Each Contractor shall, at its own cost and expense, install, operate, protect, and maintain the respective temporary services as hereinafter specified, during the construction period of the entire project. These temporary services shall include water supply, electric light and power, temporary heat, material hoists, sanitary facilities, access roads, and any other services as may be stipulated in the General Conditions, Special Requirements, and/or specifications.

B. Temporary or permanent connections made by any Contractor to existing University systems shall be approved by the University, as to location and the manner and time of the connections to such systems. Where such connections require shutdown of an existing University system, at the University Park Campus the shutdown will be made by University personnel. At other locations, the shutdown will be performed by the Contractor. A written advance notice of at least fourteen (14) days shall be given to the University by the Contractor requesting the shutdown. Directly after the final connection by the Contractor, at the University Park Campus, reinstatement of the service shall be performed by University personnel. At other locations, reinstatement will be done by the Contractor.

C. Temporary connections to new and/or existing permanent service lines shall be made at locations as directed by the University, protected while in use, and when the temporary service lines are no longer required, they shall be removed by the Contractor. Any part or parts of the permanent service lines, grounds, and buildings, disturbed or damaged by the installation and/or removal of the temporary service lines shall be restored to their original condition by the Contractor responsible for the temporary installation, by a method approved by the University.

D. At the University Park Campus, University personnel must be used to shut down and start up all University services which require interruption for temporary or permanent connections. All underground utilities or service lines uncovered or exposed by the operations under this contract shall be adequately protected by the Contractor, who shall be responsible for the repair of any damage to such services. Services and utilities in and to existing buildings must not be connected to or interrupted without making the necessary written requests to the University and receiving written permission. All interruptions to University services must be scheduled two (2) weeks in advance and will generally be made outside of normal working hours.
E. The General Contractor shall pay all costs for water, electric power, and fuel required for the operation of temporary services.

F. Any Contractor who fails to carry out its responsibility in supplying temporary services, as set forth in its contract, shall be held responsible for such failure and the University shall have the right to take such action as it deems proper for the protection and conduct of the work and shall deduct the cost involved from the amount due the Contractor.

G. All services furnished by the University will be metered by meters furnished by the respective Contractors. The services will be charged at the verified current rates.

1. Prior to a Contractor's use of steam, electricity, or water from the University's distribution systems, a meter shall be installed by the Contractor to measure the consumption.

   a. In the case of steam, condensate shall not be wasted and shall be returned to the University system.

2. When meters are installed at the University Park Campus, metering connections will be inspected and readings obtained by the University prior to any usage and periodically thereafter until the Contractor's liability for this cost ends.

   Piping for all condensate and water meters shall include all valving and hose bibs necessary to permit field checks of those meters, as well as confirm to any other requirements as might be imposed by these specifications.

3. At the University Park Campus, the University shall be notified when any meter is removed or disconnected, for any reason during this period of Contractor liability. A record shall be maintained by the Contractor relative to the length of time such meters are inoperable. If other meters are installed permanently or temporarily to replace existing meters, meter readings and serial numbers shall be recorded, appropriate record changes made, and the University's designated representative notified.

4. Reasonable access to all metering in the Contractor's area shall be provided for inspection of meter connections and periodic meter reading by the University.

H. Temporary Water Supply

1. The Plumbing Contractor shall, at its own cost and expense, install, meter, operate, protect, and maintain an adequate water supply for the use of all Contractors on the project during the period of construction, either by means of the permanent water supply or by the installation of a temporary water supply line. This water supply line shall be made available within fifteen (15) days after being so directed by the University. All Contractors shall notify the University twenty (20) days prior to the time that they will require water supply.

2. The Plumbing Contractor will be required to bring the temporary water supply to a point approximately ten (10) feet from the building. The actual location of the point to which the water is brought shall be in close proximity to the point of entrance of the permanent water supply. From this point each Contractor shall install, valve, maintain, and protect such
temporary waterlines as it will require to perform the work under its contract.

3. The Plumbing Contractor shall be responsible for the removal of a temporary water supply line, if installed, and restoration which may be required because of same.

I. Telephone Services. The Contractor shall obtain and pay for all expenses associated with temporary telephone, fax, etc., services. Service shall be arranged by calling the Office of Telecommunications (OTC) Business Office at (814) 863-7096. The Contractor shall inform OTC of the company name, services desired, location, contact name, billing address, and telephone and fax numbers. OTC will initiate the service order and all one-time, ongoing, and disconnect charges shall then be billed directly to the Contractor. The Contractor shall notify OTC when service is required to be disconnected.

J. Temporary Heat

1. The temporary heat requirements are divided into two categories; i.e., (1) temporary heat required prior to the enclosure of the structure, structures, or portions thereof; (2) temporary heat required subsequent to the enclosure of the structures.

2. A structure shall be considered to be enclosed when (a) the roof is on and tight; (b) the exterior walls have been completed to the extent that heat will be retained within the structure; and (c) when openings, doors, and windows are closed with permanent closures, or with substantial temporary closures which will affect the retention of heat within the structure.

3. Where projects are multistory, which are more than three levels or stories above grade, a building shall be defined as "enclosed" when all of the requirements of the preceding paragraphs have been met, except that the stipulation that the roof shall have been complete, shall not apply as long as the floor construction of the level above the proposed working area is complete, and as long as all stairs or other openings, which penetrate or project through the ceiling or the floor above the proposed working area have been protected.

4. Prior to enclosure of structures, or portions thereof, and when official local weather predictions indicate below freezing temperatures, the General Contractor shall provide, maintain, operate, and pay all costs including fuel for a sufficient number of approved portable heaters so that the progress of the work of all Contractors is not impeded, and proper protection of all work from freezing is maintained. Self-contained oil-fired portable heaters, which release the products of combustion inside the structure, may be used only in areas where finish work has not been started and there, only if, in the opinion of the Professional, the possible deposit on the structure interior will not have an adverse effect on the finish work to be installed.

5. Temporary heat in the enclosed structures will be required on a twenty-four hour basis when the ambient temperature is officially predicted or is actually at 35°F, or lower.

Temporary heat may be required at times other than above in order to maintain job progress and will be the responsibility of the respective Contractors to supply and pay all costs thereof.
6. After the structure is enclosed and temporary heat is required for proper construction as determined by the Professional or the University, the Heating Contractor, at his own cost and expense, shall provide the equipment and heating personnel for temporary heat. The Heating Contractor may install gas or oil-fired portable heating units provided the products of combustion are totally vented outside the building. The Heating Contractor, upon approval by the University, may utilize the permanent system or portions thereof or may install temporary steam or hot water radiation or convection or a combination of both. If the permanent system is used and water treatment equipment is to be installed as part of the contract, then such equipment is to be installed and operated to protect the system. The Heating Contractor shall operate portable steam or hot water generating equipment for supply to permanent or temporary structure heating facilities unless steam is available from University lines. The Heating Contractor may install, valve, meter, operate, protect, and maintain a temporary steam heating system through connections to existing University steam lines, but may do so only if the University will state, in writing, that the existing steam system can supply sufficient quantity of steam to meet the Professional's estimate of the quantity that will be needed to maintain adequate temporary heat. The University, within its facilities, will furnish steam for temporary heat under a specified schedule of charges.

7. Temporary heating system shall be of sufficient capacity to heat the interior of the building to 50°F, when the outside temperature is 0°F. Temperature at all times must be 50°F or above. This service shall be continued until the entire project is completed.

8. Where electricians or plumbers are required to install, operate, supervise, or maintain equipment used in the provision of temporary heat, the payment for the services of such personnel shall be the responsibility of the Electrical or Plumbing Contractor, respectively.

9. The General Contractor, at its own cost and expense, shall remove all soot, smudge, and other deposits from walls, ceilings, and exposed surfaces which are the result of the use of any temporary heating equipment, including the use of the permanent heating system for temporary heating purposes. The Contractor shall not do any finish work until all such surfaces are properly cleaned.

10. All permanent heating equipment used to supply temporary heat shall be completely cleaned and reconditioned as necessary by the Heating Contractor prior to final acceptance by the University. All permanent heating equipment such as radiator trap seats and diaphragms, valve seats and discs, strainer internals, or any other equipment found to be damaged due to being used for temporary heat shall be replaced. All such replacements must be checked and approved by the University.

11. The use of either temporary or permanent electric resistance heating will not be permitted for temporary heat. Where permanent electric resistance heating is specified, temporary heat shall be independent of the permanent system.

K. Construction Light and Power

1. All references made herein to the Electrical Contractor shall refer to the Electrical Contractor performing the work under the contract.
2. The Electrical Contractor shall contact the University and make all arrangements for the electric service. The Electrical Contractor shall install a KWH demand plus KWH metering and billing meter for all construction light and power taken from the University system as specified above.

3. The Electrical Contractor shall arrange with the University for service from the existing lines. Electrical Contractor shall furnish and install a circuit breaker or fused switch of sufficient capacity to handle the construction load at the building. Electrical Contractor shall also furnish secondary service for lighting only to each Contractor's office. The current transformers and metering will be installed by the Electrical Contractor.

4. At University Park Campus, where temporary electric service is secured from the University's 5 KV or 12 KV distribution system, the Electrical Contractor shall install the system in the same manner as if the system were permanent. This includes fused disconnects installed as close as possible to the tap to the University's system, 5 KV or 15 KV shielded cable as required, proper termination of cable including stress cones, grounding, lightning arresters on overhead lines and proper insulators and adequate clearance for overhead lines. Transformer bank shall be connected for a balanced 120/240 V distribution except when directed otherwise.

When this installation is complete and before connections may be made, the University shall be notified so that arrangements can be made for testing, inspection, and approval by the University before final connection is completed.

It will be the University's option to waive the test.

All interruptions to University services must be scheduled two (2) weeks in advance. In order to keep the downtime to a minimum, the Electrical Contractor shall complete as much of the work as possible prior to the interruption.

5. The temporary service distribution points shall be located as near as possible to the building and shall not cause an obstruction or interference to other Contractors in the performance of this work.

6. The Electrical Contractor shall furnish and install the temporary electrical services for construction light and power for all Contractors, maintain and operate the services as long as required during the entire period of construction for the project. Temporary electrical service shall be supplied during normal daily working hours based upon a forty-hour work week. When any Contractor requires service beyond the above, that Contractor shall be responsible for the cost thereof.

7. The Electrical Contractor shall provide all wiring, safety switches, panels, poles, supporting structures, lamps, and weatherproof sockets, all of which shall be properly and safely installed.

8. The Electrical Contractor shall provide a 100-watt electric lamp and 120-volt power receptacles approximately every fifty (50) feet on the lines in weatherproof sockets. These facilities shall be installed so as to light all exitways, stairway landings, and to provide one light and one receptacle for each 1,000 square feet in all spaces which exceed 1,000 square feet. Lights shall be provided with protective cages.
9. Where temporary electrical service is required at the Commonwealth Campuses, and this service is secured from the high-voltage distribution system, the Electrical Contractor shall make all arrangements with the local electric utility company for obtaining temporary electric service. As a minimum, the temporary service installation shall meet all requirements of the utility company. Where the utility company requirements are less stringent than the requirements herein specified, at the option of the University, the more stringent requirements shall be applied.

10. The Electrical Contractor shall provide three (3) 208-volt, single-phase power receptacles, each rated at 4,000 watts, outside the building. The maximum size motor to be used by any Contractor shall be limited to five (5) horsepower. Where a service of a type other than that herein specified is required, each Contractor requiring same shall furnish and install and pay all costs for special services. If special service is not available, the Contractor requiring same shall furnish, install, and maintain separate internal-combustion engine-generator sets. Electrical power will not be made available for welding machines or electric heating equipment.

F-16 Electric Power Equipment

A. Due to the limited capacity of electric distribution on the Campus, the use of A.C.-powered welders and electric heaters is prohibited.

F-17 Temporary Sanitary Facilities

A. Sanitary facilities will not be provided by the Owner. The use of Owner's facilities is prohibited (unless prior approval is granted by the Owner).

B. The General Trades Contractor shall, at its own cost and expense, provide, operate, and maintain in a clean and sanitary conditions, adequate sanitary facilities as approved by the Owner.

1. All sanitary facilities shall be fully enclosed buildings, screened against insects.

2. Open-pit type facilities will not be permitted.

3. Deleted text. [C]

4. When directed by the Owner, the Contractor shall dismantle and remove these facilities and leave the premises clean as required.

5. As soon as permanent soil lines have been installed inside the building, the Plumbing Contractor shall install two temporary water closets and two lavatories. These shall be kept in working order by the Plumbing Contractor and shall be maintained in a clean and sanitary condition by the General Trades Contractor.

6. The use of self-contained "Job-Johnny" units will be permitted upon approval by the Owner.
F-18 Existing Underground Service and Utility Lines

A. Notification to Public Utilities Prior to Excavation or Demolition Work When Using Powered Equipment or Explosives.

1. All Contractors shall comply with all requirements of the Act of December 10, 1974 (P.L. 852, No. 287), referred to as the Underground Utility Line Protection Law, as amended by the Act of December 12, 1991 (Act No. 1991-38), prior to excavation or demolition work when using power equipment or explosives.

B. At all locations, all underground utilities or service lines uncovered or exposed by the operations under the contract shall be adequately protected by the Contractor, who shall be responsible for the repair of any damage to such services. Contractor shall be responsible to the Owner for all costs resulting from the Contractor’s damage to University lines. These include, but are not limited to material cost, wages, supervisory professional costs, disruption of services, research, and overhead costs. Contractor must notify the University immediately of any damages to utility lines and street lighting. Repairs shall be made by a method approved by the University.

F-19 Interruption of Existing Services

A. Utilities serving existing buildings, installations, or facilities shall not be interrupted until the Contractor has made the necessary arrangements with and has received approval from the University.

B. In the event that interruption of any existing utility service is necessary, the responsible Contractor shall be required to make all arrangements for shutdown and start-up of such service with the University representative, and shall pay all costs for such interruption and service restoration.

C. University crews must be used to shut down and start up all services which require interruption for temporary or permanent connections.

D. All planned interruptions to University services must be scheduled two (2) weeks in advance and the work will generally be done outside of normal working hours.

F-20 Laying Out the Work

A. The General Trades Contractor shall employ a competent, experienced engineer and have the engineer determine all lines and grades and certify same from time to time during the progress of the work.

1. The General Trades Contractor shall procure services of a registered land surveyor to perform the field layout work for establishing primary site lines and levels. If any of the control points initially are moved or lost, control points shall be re-established by the General Trades Contractor at no additional cost to the Owner. Contract work shall properly relate to lines and levels and detail dimensions shown or established by supplemental drawings.

2. All engineering or field layout for points necessary to perform work is the responsibility of each Prime Contractor and all such information must be copied to the Construction Manager.
3. All other layout is the responsibility of each Prime contractor. Contractors shall exercise proper precaution to verify the dimensions shown on drawings prior to laying out work and report any inaccuracies or errors to the Construction Manager prior to beginning work. The contractor shall be held responsible for any error resulting from failure to exercise such precautions. Coordinate and check all other dimensions and levels as necessary for detailed layout work. All discrepancies, which are found, must be coordinated with the Construction Manager prior to proceeding with the work.

4. Contractors are cautioned that temperature corrections during all surveying and layout must be used. Contractors will be responsible for any and all extensions of lines and grades necessary for their work.

5. Contractors are expected to broom clean as necessary for their own layout.

6. At the request of the Construction Manager provide certification, signed by the Contractor's retained field engineer, certifying that elevations and locations of improvements are in conformance or nonconformance with requirements of the Contract Documents.

F-21 Measurements

A. Before ordering material or proceeding with the work, the Contractors shall verify all measurements at the site. No extra compensation will be allowed because of differences between actual measurements and dimensions shown, but such differences shall be referred to the Professional for consideration before proceeding with the work.

F-22 Clearing of Roads, Parking Areas, and Traffic on Campus

A. The General Trades Contractor shall daily clean all mud, dirt, and debris resulting from all Contractors’ operations from the adjacent streets, sidewalks, drives, and parking areas, and shall repair all damage caused by the cleaning. If the Contractor fails to clear mud and construction debris from roads and walks, the University will clear this mud and debris and bill the Contractor(s) at cost.

B. All traffic will be subject to the rules and regulations and penalties of its University and applicable local laws. All hauling and construction traffic shall use only those roads designated by the University. The use of Jake Brakes on campus is prohibited.

C. Contractors shall carefully schedule delivery and installation of its work so to cause the least interruption of normal rush-hour traffic.

D. The General Trades Contractor shall maintain streets, sidewalks, and driveways free of encumbrance at all times for pedestrian and automotive traffic. When necessary to block these off, do so only with prior approval of the University and only at designated time. Each closing must have the prior approval of the University.

E. Parking for Contractors’ employees is prohibited on campus roads, drives, and courts.
F. Where mud, snow, ice, or other hazardous conditions exist, the General Trades Contractor shall remove the hazards or shall provide and maintain such temporary pathways as are required for safe and expeditious prosecution and inspection of the work of all trades.

F-23 Cleanup

A. The General Trades Contractor shall take precautions against the presence of rats, mice, and other pests. The General Trades Contractor shall exterminate them if they are observed, engaging a reputable exterminating firm to give regular service as necessary.

B. Each Contractor shall keep the premises clean at all times of dirt, rubbish, and debris resulting from the work of all contracts, and shall remove all rubbish and debris in metal containers at the end of each working day. Each Contractor shall remove all rubbish and cartons resulting from the installation of fixtures and equipment. Disposal of materials by burning at the site is expressly prohibited. The Contractor will not use the University's trash collecting containers.

C. Prior to substantial completion of the work, each Contractor and Subcontractor shall do the final cleaning of the surfaces of all the Contractor's installations as may be required by the various specification sections.

D. Each Contractor, in addition, shall employ a professional cleaning organization to remove all paint and stains from glass and to wash all glass throughout the work, to clean and polish the finished surfaces of all fixtures, equipment, and accessories and to vacuum clean all floors.

E. All permanent equipment used to supply temporary services shall be completely cleaned and reconditioned by the appropriate Contractor prior to final acceptance by the University. Filters shall be in clean condition, interiors of all strainers shall be replaced or cleaned and seats on all valves and diaphragms on all traps of all sizes of the used portions shall be examined, cleaned, and replaced as necessary to the satisfaction of the University. Costs of cleaning, reconditioning, and replacement of parts of the permanent systems shall be at the expense of the responsible Contractor.

F. If a Contractor fails to clean up, the University may do so and the cost thereof shall be charged to the Contractor as provided in the General Conditions.

F-24 Existing Facilities

A. The University will maintain activities and normal office hours in the building during the course of this construction project. Difficulties of working in an existing operational building are recognized; however, the Contractor must cooperate to keep noise, dirt, and other interferences to a minimum. Housekeeping shall be such to assure no disruption of the University's operations and the Contractor shall schedule his work well in advance and give notice to all building occupants of any disruption.

B. Existing facilities must be maintained watertight and dust free at all times. The Contractors shall make all necessary provisions to this end and shall be responsible for any damage resulting from noncompliance with this requirement.

F-25 Requirements During Construction
A. Fence open ditches. Where walks cross such ditches, bridged walkways must be provided with rails on both sides. Bridged walkways must be adequately lighted at night.

B. Service temporary walks and roads with No. 2 crushed stone if they are to be in public use.

C. Walks and roadways used by both Contractor and the public shall be kept in repair and cleared by the Contractor at least once each day and more often as conditions require.

D. Place no obstructions on or within fifteen (15) feet of fire hydrants. Hydrants must be accessible for fire fighting purposes.

E. Protect and attend any type of temporary heating units used.

F. Where walkways, roadways, or entrances used by the public are adjacent to or pass under construction scaffolding or near building edge, the Contractor shall provide an adequate covering for such area to protect passersby from falling objects.

G. All temporary construction sheds, trailers, and flammable liquid storage areas belonging to Contractors shall be so placed on the construction site to minimize any danger to University property and the public.

H. The University Department of Environmental Health and Safety is available for consultation regarding the above items and any other safety matter.

F-26 Protective Barricades

Contractors shall be aware that the University community includes many people with disabilities (visually impaired, wheelchair-bound, etc.), requiring extra attention on the part of the Contractor to assure that construction work is properly identified and protected. The following provides minimum protective measures to be followed by Contractors doing work beyond the main project construction fence in order to protect the general public from hazards created by open excavations, manholes, etc.:

A. Any excavations outside the project fence shall be adequately protected to prevent falls, injury, or other hazard to the general public and University population, as follows:

1. Excavations for the purpose of constructing/installing manholes, meter pits, valve pits, or similar appurtenances must be completely surrounded by a rigid fence (not flagging tape or plastic netting) of sufficient height and strength to prevent individuals from crossing into the excavated area. Such fencing shall incorporate toeboards around the bottom and must be positioned and sufficient distance from the top of excavation to provide adequate protection against undermining or sloughing off of the excavation slopes.

2. Ditch excavations, such as for electrical, water, sewer, steam, gas, or other underground utility lines, shall, as a minimum, be protected on all sides with snow fencing or similarly strong material; fencing shall be positioned a safe distance away from the top of slope of the excavation.

B. Construction equipment used for hoisting men or materials (e.g., cranes and "cherrypickers," construction line trucks, mobile platforms, etc.) must be
surrounded by appropriate protective barricades, safety lines, and signage to alert passersby of the presence of overhead loads and to provide adequate clearance around all boom swing areas, tail swing areas, overhead loads, and operating machinery. Passersby shall not be permitted to travel beneath suspended loads under any circumstances. If necessary, Contractor shall provide a flagman to assure safe passage of pedestrian and vehicular traffic.

C. Open manholes must be protected at all times by a rigid, fence-type barricade around the opening.

D. Flagging tape and traffic cones are not, under any circumstances, suitable or permissible barricading materials.

E. Contractors shall notify—and receive approval from—the University's Construction Inspection Office prior to beginning any excavation or opening of any manholes outside the project fence. The Inspection Office will then advise the appropriate University office of the hazardous condition, including location, approximate starting time, and expected duration of the situation.

F. Contractors shall report immediately to the University's Construction Quality Representative any accident or other incident, no matter how minor, which involves any member of the general public. The telephone number of the University's Construction Inspection office is (814) 863-3316.

F-27 Delivery and Storage

A. On-Site. All materials and equipment shall be delivered to the site and stored at locations approved by the University. Each Contractor shall be responsible for proper care and protection, and shall protect and be responsible for any damage to its work or materials from the date of the Agreement until final payment is made, and shall make good without cost to the University any damage or loss that may occur during this period. All cement, lime, and other materials which may be affected by the weather shall be covered and protected to keep them free from damage while they are being transported to and stored on the site. Should any materials be found defective or in any way contrary to the Contract, this material, no matter in what stage of completion, may be rejected by the Professional and/or the University and shall be removed from the site at once.

B. Inside Building. In no case shall any materials be stored in mechanical and electrical spaces, nor shall any paint or other combustible supplies, tools, or equipment be stored in the building, except in tightly sealed metal containers, in well-ventilated spaces, and in a quantity limited to that day's need.

C. Provisions for Large Items. The General Trades Contractor shall make provisions for bringing into the building large items of equipment by leaving temporary openings for them as determined to be required. After the equipment is set in place, the General Trades Contractor shall close the opening as required.

D. Materials must be stored in such a way as not to damage existing structures or surrounding area. Any material or equipment stored on the roof of any building must be placed on dunnage and not directly on roof surface.

F-28 Fire Protection

A. The General Trades Contractor is responsible to maintain overall site safety including fire extinguishers inside the new building structure that meets OSHA requirements. Each contractor and subcontractor must supply and maintain a fire
extinguisher in all temporary rooms (including jobsite trailer), at flammable material storage areas, and at all locations where welding or burning occurs.

B. No fires for any purpose shall be permitted on the project. Remove all refuse from University property.

A. No welding, cutting by torch, or work utilizing or causing inflammable wastes shall be done unless adequate fire protection is provided and maintained for the duration of the work in the area of operations. University welding/cutting permits will be required and shall be issued at no cost to the Contractor by the University.

F-29 Job Site Security

A. The University will not provide job site security.

B. The University assumes no responsibility for damage or loss to the Contractors’ property.

F-30 Dewatering

A. The General Trades Contractor shall assume responsibility for continuous removal of all water, including surface and rainwater, by the use of pumps, drains, and other approved methods necessary to keep the excavation and site free from water at all times until completion.

B. All water must be directed away from existing structures, shall cause no erosion and shall prevent foreign material from backing up existing drains or entering into the sewers.

F-31 Fastening Devices

A. Fiber, plastic, lead plugs and shields, and any devices using wood screws are not acceptable as fastening devices to plaster, tile, concrete, or masonry. Use expansion bolts or driven devices in solid construction, and toggle bolts in hollow construction.

F-32 Welding

A. All welding and cutting shall be done by qualified and certified welders. Certificates shall be filed with the Professional and the University prior to commencement of any welding.

F-33 Noise Control

A. In most instances, noise control will be a matter of prime concern. It is, therefore, mandatory that all equipment such as compressors, generating equipment, etc., shall be fitted with mufflers or other noise abatement attachments.

B. It may become necessary to schedule some operations during periods of low occupancy of neighboring buildings.

F-34 Provision for People with Disabilities

A. All structures designed for general use, shall comply with all local, state, federal, and University regulations for facilities to accommodate people with disabilities.
F-35  **Asbestos Removal**

A. The University has an ongoing asbestos identification and removal program. On renovation projects where the possibility exists that material containing asbestos fibers may be encountered, the situation will be reviewed by the University and a course of action determined.

B. Possible asbestos removal situations will be discussed between the Professional and the University on a project-by-project basis.

C. If asbestos is found to be present after construction is underway, the University Construction Inspection Office is to be notified immediately so that proper removal work can begin promptly. Removal or repairs will then be initiated following all applicable EPA and OSHA regulations.

F-36  **Advertising Signs**

A. Neither the Professional nor Contractor shall erect advertising signs.

F-37  **Project Sign**

A. On projects funded solely by the University, a project sign shall be prepared and erected by the General Trades Contractor and shall conform to the Specifications provided by the University.

B. The appropriate project name shall be inserted.

F-38  **Warranty Period**

A. During warranty periods, the University will respond to emergency situations, that is, situations determined to be potentially harmful to the surrounding personnel, equipment, or environment. In cases where work is performed by University employees, the Contractor will be charged for all labor and material needed to complete emergency repairs, if the repairs are determined to be the result of faulty material or workmanship. The performance of these repairs shall not void any Contractor's warranties.

B. The University will begin preventive maintenance programs immediately following final inspections. Preventive maintenance activities shall not relieve the Contractor from any equipment warranties.

F-39  **Schedules and Reports**

A. Refer to General Conditions of the Contract, Article 11, for a detailed breakdown of information required.

B. Together with each monthly application for payment, the Contractor shall forward to the University a summary report of the progress of the divisions of the work.

F-40  **Confined Spaces**

A. All Contractors will have a written OSHA compliant permit-required confined space program.

F-41  **Demolition Work**
A. Contractor is responsible for PA DEP/EPA notifications required for demolition work. Paperwork must be submitted to the Owner for review prior to submission to the proper agencies. Notification form templates are available from the Owner.

B. Demolition Contractor performing work requiring notifications must be prequalified by the Owner.

F-42 INFORMATION REQUIRED BEFORE STARTING WORK – The Contractor will provide the following information not later than thirty days following the execution of the Contract.

F-42.1 Detailed Work Plan
Each contractor shall submit to Construction Manager a detailed work plan outlining all phases of their work. At a minimum, this written plan must include:

A. A Logistics Plan that describes in detail the methods that will be used to perform your scope of work. The plan must identify major equipment that will be used, any temporary utilities that will be required to perform your work, and how materials will be brought on-site and/or how debris will be removed from the site.

B) A Project Schedule On bid day each contractor must provide a schedule indicating major durations for their portion of the work. By thirty days after execution of the Contract each Prime Contractor shall have submitted to the Construction Manager and the General Trades Contractor and schedule outlining all phases of the work that clearly identifies sequence of work, manpower requirements, duration to complete each major work area, critical starting dates, long lead item approval/release, delivery dates and expected shift work. This schedule must be coordinated by the General Trades Contractor with all other Prime Contractors into a Project Schedule and be signed off by those Prime Contractors at the time of submittal. As work progresses, updated 2-week look-ahead schedules must be provided to coincide with project meeting dates. In addition, a shop drawing submission schedule must be provided within ten working days showing all items requiring shop drawings and/or catalog cuts. This schedule must specify the estimated dates of submission, fabrication times, the delivery dates required to maintain the Project Schedule, and be tied to the master Project Schedule.

C) A project specific Staffing Plan that identifies who will manage the overall scope of your work for this project. This plan will identify (by name) the individual staff members you will use on the site. Additionally, the work experience resumes of the listed management individuals must be submitted. The contractor shall provide supervisory personnel consistent with the size and complexity of the project, who shall be fully capable of controlling their workers, coordinating work through the Construction Manager, performing in harmony with other trades, and completing work in accordance with the schedule.

D) Each Prime Contractor shall furnish a list of Subcontractors, Suppliers, and Vendors, including phone numbers and email addresses as required, which they propose to use on the Project.

E) All contractors, subcontractors and sub-subcontractors, shall comply with all federal, state and local laws and regulations regarding equal employment opportunity.
F) A schedule of values detailing project costs by area. This schedule is to be reviewed and approved by the Owner and Architect and will be the basis of pay application requests as the project progresses.

G) All required contract documents including but not limited to signed contracts, approved insurance certificates and all bonds.

F-42.2 Safety Procedures Manual
Prior to beginning any work on site, each Contractor shall submit an OSHA compliant site specific Safety Procedures Manual that identifies all site-specific safety issues related to his work and details how each will be addressed. This manual will include the Material Safety Data Sheets (MSDS) for all potentially hazardous substances that will be used in performing the scope of your work. In addition, a site specific Hazardous Substance Survey Form that outlines all of the MSDS sheets applicable to this project must be submitted. MSDS inventory log shall be updated weekly. One (1) copy of this plan must be held on site in the Construction Manager’s project office.

F-42.3 Crane Inspection Report
All Contractors whose work includes the use of material or personnel lifting devices must submit a copy of the Annual Crane Inspection Report prior to starting work. The report must conform to either OSHA section 1910.180 or section 1926.550. Note that this is not referring to a Crane Safety Checklist but rather the Annual Crane Inspection Report. If a crane is brought on site without proper documentation or inspection, said crane will be removed at once from the site, with any associated charges borne by the responsible Contractor.

F-42.4 Pre-Installation Conference
The contractor shall arrange for a meeting on site with the Construction Manager 2 weeks prior to the scheduled start of his work. These meetings will be required for items as detailed in the schedule of values or as necessary during the course of the work. This meeting will discuss:

A.) Review progress of other activities and preparations for the activity under consideration, including schedules, safety, submittals, manufacturer’s recommendations, weather limitations, substrate acceptability, compatibility problems, and inspection and testing requirements.

B.) Record significant discussions, agreements, and disagreements of each conference, along with the approved schedule. Distribute the meeting record to everyone concerned. The minutes will verify that the items listed above were discussed, and will document the actions taken or required and by whom the action is required. The Contractors are required to review these minutes and submit any objections to the Construction Manager within 3 days or the minutes recorded will stand as record.

C.) A list of contractor key personnel, with address and telephone numbers for emergency calls (both work hours and non-work hours).

D.) Contractors are expected to be experienced and familiar with the requirements and conditions imposed during the performance of similar work in this area. Some of these requirements are the performing of normal “out-of-sequence” work, and non-continuous work.

E.) The contractor shall maintain the progress of his work, consistent with the project schedule. Failure of the contractor to maintain such progress shall make the contractor liable for all costs incurred by Owner as a result of the contractor’s delays including, but not limited to claims by other contractors.
and/or penalties imposed by the Owner. In addition, the contractor is required to provide a recovery schedule within 24 hours of its failure to maintain progress.

F.) Contractors shall have responsible representations at job meetings held and scheduled by Construction Manager at their Field Office. Contractors failing to attend and abide by the content of these meetings may be held responsible for any delays and/or expenses incurred due to coordination difficulties in their trades.

G.) Before commencing any work, consult with the Construction Manager regarding the use of the facility, including but not limited to, roads, walks, ramps, garage, parking areas, storage areas, corridors, stairs, etc., that may be required to prosecute work.

F-42.5 Waiver of Liens as required.

F-42.6 Communications
Any and all communication with the Architect and/or Owner shall flow through the Construction Manager. There shall be no direct communication with the Architect and/or Owner without prior knowledge and/or written consent of the Construction Manager.

F-42.7 Permits and Fees:
Each Prime contractor except General Trades shall secure and pay for all permits and governmental fees, licenses and inspections necessary for the proper execution and completion of the Contract. The Pennsylvania State University will provide to the General Trades contractor the general building permit. All permits and inspection reports will be copied to the Construction Manager and posted as required.

F-43 SITE LOGISTICS (See attached Site Logistics Plan)

F-43.1 Material and Equipment Storage/Staging
Construction materials and equipment deliveries must be scheduled with the Construction Manager and are subject to coordination with other trades. Contractors are to bring only that material which will be used in a reasonable time frame as reflected by associated activities in the construction schedule. The extent of storage materials and equipment at the site shall be approved on an ongoing basis by Construction Manager in coordination with other trades. If stored material or equipment obstructs the progress of any portion of the work or interferes with the day to day operation and work flow, they shall be removed or relocated by the contractor as directed by the Construction Manager without reimbursement of costs. All materials shall be stored in an orderly manner and material security is the responsibility of the Contractors. Improperly stored items may be rejected from use on the project.

All equipment must be in compliance with all local, state, and federal regulations relating to its safety.

If in the opinion of the Construction Manager, the jobsite cannot accommodate either early or bulk delivery of materials or equipment, the Contractor will make off-site arrangements for safe and secure storage at no additional cost.

F-43.2 Equipment Locations
The locations of cranes, mixers, field offices, workbenches, cutters, hose lines, etc., must be approved by the Construction Manager prior to utilization on this project. In addition, any contractor wishing to place a crane upon this project for the purpose of lifting materials or equipment must submit a lifting procedure safety plan and a current inspection certificate. This contractor will be responsible to erect, remove, maintain and replace any required safety barriers and restore the erection area when complete.

F-43.3 **Construction Fencing, Gates and Barricades**
The Construction Manager will provide the perimeter construction fence and gates. Any fencing, barricades or flaggers for utility or other work outside the perimeter construction fence (see logistics plan section H3) in the responsibility of the Prime Contractor Completing the work. Anytime that either pedestrian or vehicular traffic is affected by the Prime Contractors work, flaggers will be required unless a safe detour with proper signage can be provided and the detour is approved by the Construction Manager and Owner.

F-44 **JOBSITE RULES AND MISCELLANEOUS REQUIREMENTS**

F-44.1 **Project Staff**

All trades, including but not limited to, demolition, general trades, mechanical, plumbing, HVAC, and electrical shall provide qualified and experienced Project staff including Project manager, coordinator/Project engineer, quality assurance/quality coordinator, environmental health and safety officer, and superintendents. Failure to maintain a superintendent on the Project site at all times work is in progress shall be considered a material breach of the Contract, entitling the Owner to seek equitable reimbursement by the Contractor, for durations until the superintendent is on the Project site full time. All communication given to or produced by the Project staff shall be binding as if given to or produced by the Contractor. The superintendent and/or other required Project staff shall be in attendance at the Project site not less than eight hours per day, five days per week, or as required when work is in progress. The Contractor or any other entity shall not employ the superintendent on any other project during their specified term at the Project site. Other members of the Project Staff will process work for the project so as to meet all deadlines/milestones of the project schedule and/or as required by the pace of construction.

F-44.2 **Communication**

Correspondence boxes for each contractor will be set up in Construction Managers field office. It is expected that correspondence be picked up daily while working on site. All site superintendents must have a working cellular phone equipped with voicemail for the duration of the project and during normal working hours.

F-44.3 **Daily Construction Reports**

Daily Construction Reports should be complete per project specifications and returned to Construction Manager. Each Prime Contractor is required to complete and submit daily reports. Payments may be withheld upon failure to submit these reports.

F-44.4 **Jobsite Conduct**

Each Contractor’s management team should review with all their employees that it is imperative that their conduct be socially acceptable at all times. Vulgar or abusive language, sexually suggestive comments or gestures are strictly prohibited and will result in immediate removal from the jobsite and/or criminal prosecution.

F-44.5 **Limited Access Areas**

Due to the fact that a day care facility, laboratories performing experiments and experimental animals are housed in buildings adjacent to the construction site no
employees of the prime contractors or their subcontractors will be permitted to enter the adjacent buildings (Henderson Building, Henderson North, Henderson South and Health and Human Development East) without coordination with PSU and MCMS. Workers entering these facilities without the knowledge of either PSU or MCMS will be subject to expulsion from the project site.

F-44.6 Clothing
Proper attire is required on-site. Full-length pants, full length shirts with sleeves, hard sole work boots are required along with any/all safety equipment prescribed in each contractor's safety plan. Wearing no shirt or tennis shoes is prohibited.

F-44.7 Lunch Areas
All Contractors must provide a container within their break/lunch area for the placement of trash. The areas used for construction lunches are to be kept clean and orderly. The Contractors will provide the labor necessary to clean common use areas daily and dump these public trash containers each day.

Recycling of Lunch waste will also be required as part of the LEED requirements for this project. Each Prime Contractor will be responsible for lunch waste recycling for their workers and subcontractors.

F-44.8 Damages
All contractors are cautioned that since this work will be performed in close proximity and adjacent to existing occupied properties, all precautions, protection and care must be exercised to protect existing structures in accordance with good safety practices. This is particularly applicable to protection for pedestrians.

The contractor is responsible for any damage, which may occur to the property of the owner or adjacent private or public properties which in any way results from the acts or neglect of his employees.

In Addition, repair and make good, at the expense of the Contractor, all damages thereto including damage to existing utilities and paving arising from operations under the Contract. Repair and protection is the Contractor's responsibility, regardless of the assignment of responsibility for inspection, testing, or similar services.

F-44.9 Quality Control
In addition to the requirements of the specifications, the following shall also apply: It is in the best interest of both Massaro and the contractor to provide top quality workmanship and materials in accordance with the contract drawings and specifications. The contractor agrees to actively participate in Construction Managers Quality Control Program and to correct deficient work immediately upon its discovery at no additional cost to the Construction Manager or the Owner.

Protect construction for quality control service activities until accepted through the Substantial Completion process including inspections by Architects and Engineers.

F-44.10 Manufacturer's Field Services
When directed by the Construction Manager, require the manufacturer or supplier of a product or service connected to the project to have qualified personnel provide on-site observations and recommendations at no additional cost to the Owner. Representative shall submit written report to the Architect and the Owner listing observations and recommendations. The Manufacturer shall validate the quality of workmanship and materials when required by manufacturer warranty and site visits by Construction Team Members may be required. Comply with manufacturer's installation instructions and recommendations, to the extent that those instructions
and recommendations are more explicit or stringent than requirements contained in Contract Documents

Provide attachment and connection devices and methods necessary for securing Work as required by the manufacturer, even if they are not illustrated on the Contract Documents.

F-44.11 Continuing Performance
Pending final resolution of a claim, unless otherwise agreed to in writing, the contractor shall proceed diligently with performance of the contract and payments shall continue to be made commensurate with that performance in accordance with the contract documents.

F-44.12 Owner Related Issues
The Owner shall, in conjunction and coordination with the Construction Manager, have the right to place and install equipment during progress of the work and the contractor agrees that such placing and installation of equipment shall not evidence completion of the work or portions of it, nor signify the Owner’s acceptance of the work or portions thereof.

Contractors are advised that the Owner may, at his discretion, employ other contractors or employees to perform work on this project. In such an event, all trades working under this contract shall cooperate in order that the work of all parties can be completed in reasonable order.

The Owner’s equipment suppliers shall be provided with reasonable use of power and light (normal working hours) necessary for the installation of their work without additional cost to the Owner or Construction Manager.

F-45 SITE STOCKPILES (SOILS)
The General Trades contractor is required to stock pile and maintain on site all topsoil removed for the new building footprint. Location on site to be coordinated with the Construction Manager

F-46 GENERAL PROTECTION

F-46.1 Protection of Finished Work
All Contractors are wholly responsible for the protection of finished work, both their own and that of others, as may be required to perform their work. Each Contractor is responsible for any damage, which may occur to the property of any other Contractor connected with the work, or to adjacent private or public properties, or to any portion of the structure that in any way results from the acts of neglect of his/her employees.

F-46.2 Cutting and Patching
All patching shall be done by tradesmen who are skilled in the required work. All patchwork will be done to the highest quality standards. Each contractor is responsible for all cutting and patching associated with the performance of their work under the Contract and shall include in their bid the cost of all cutting and patching required in connection with performance of his work. Include supports, protection from elements, protection of surroundings, and immediate clean up.
If necessary for the contractor to remove a minimal amount of spray on fireproofing after initial installation it will be his responsibility to replace or pay for the necessary patching.

All contractors affected by temporary utilities/openings shall include necessary comeback to infill, patch, etc.

The Contractor shall not damage or endanger any portion of the work of other Contractors or property of the Owner. The Contractor shall not alter the Owner’s or other Contractor’s work without written consent of the Owner or other Contractor. All such requests shall be made through the Construction Manager. Said consent shall not be unreasonably withheld.

If unsafe or unsatisfactory conditions are encountered, take corrective action before proceeding. Protect existing construction during cutting and patching to prevent damage. Until provisions have been made to bypass them, take all precautions necessary to avoid cutting existing pipe, conduit, or ductwork serving the building but scheduled to be removed or relocated. Where cutting is required use hand or small power tools designed for sawing or grinding, not hammering and chopping. Cut holes and slots neatly to size required to minimum disturbance of adjacent surface. Temporarily cover openings when not in use. To avoid marring existing finished surfaces, cut or drill from the exposed or finished side into concealed surfaces.

F-46.3 **Perimeter Protection**
   It is the responsibility of the General Trades Contractor to conform to all OSHA requirements for fall protection for the building perimeters and interior openings.

F-46.4 **Penetration Protection**
   Each Prime Contractor is responsible for protection of any penetrations made in floors or roofs during installation of their work. Protection should be per OSHA requirements.

F-46.5 **Traffic Control**
   Provide traffic control barriers and flag persons throughout the construction period at any point in time that construction traffic obstructs normal traffic conditions.

**END OF SECTION**
SECTION G
BASIS OF BIDS
FOR

DGS CONTRACT #800-290.HA1.1 HAZARDOUS BUILDING MATERIAL ABATEMENT

G-01 General Requirements
A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.HA1.1 HAZARDOUS BUILDING MATERIAL ABATEMENT, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1
A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.HA1.1 HAZARDOUS BUILDING MATERIAL ABATEMENT, Construction, complete and ready for use.

G-03 Unit Cost #1
A. Provide Unit cost data as requested in Section H6, Appendix B of the “Asbestos Containing Material Removal Performance Specification”. Enclose Appendix B form loose indicating values with proposal.

G-04 Notice
A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-05 Surety Company
A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G
BASIS OF BIDS
FOR

DGS CONTRACT #800-290.BD2.1 BUILDING DEMOLITION

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.BD2.1 BUILDING DEMOLITION, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.BD2.1 BUILDING DEMOLITION, Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G
BASIS OF BIDS
FOR
DGS CONTRACT #800-290.GC3.1 GENERAL TRADES

G-01 General Requirements
   A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
   B. All requirements specified hereinafter for DGS CONTRACT #800-290.GC3.1 GENERAL TRADES, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1
   A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.GC3.1 GENERAL TRADES, Construction, complete and ready for use.

G-03 Basis of Bid For Bid Item No. 2
   A. Bid Item No. 2, Alternate #1, shall be the lump sum deduct price to delete the brick wall veneer (corridor only) on floors 2, 3 & 4 and replace it with painted drywall. Painted drywall would be as per contract documents.

G-04 Basis of Bid For Bid Item No. 3
   A. Bid Item No. 3, Alternate #2, shall be the lump sum deduct price to delete the limestone wall veneer on the 1st floor in all areas (except Lobby F104, Interactive Research Commons 117 and Conference Rooms) and replace it with painted drywall. Painted drywall would be as per contract documents.

G-05 Unit Cost #2
   A. Provide Unit cost data for rock excavation and removal as an add or deduct per cubic yard measured in place that is less than or greater than information indicated on the bidding documents.

G-06 Unit Cost #3
   A. Provide Unit cost data for partial depth concrete repair as shown on the Civil Drawings and indicated in the “STEAM TUNNEL INTERIOR WALLS AND CEILING CONCRETE SPALL REPAIR”. Unit cost shall be indicated on a per cubic foot basis measured in place that is less than or greater than the estimated quantity indicated on the bidding documents.
G-07  Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-08  Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G
BASIS OF BIDS
FOR
DGS CONTRACT #800-290.5 FIRE PROTECTION

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.5 FIRE PROTECTION, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.5 FIRE PROTECTION, Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G [C]
BASIS OF BIDS
FOR

DGS CONTRACT #800-290.3 PLUMBING [C]

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.3 PLUMBING, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.3 PLUMBING, Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G [C]
BASIS OF BIDS
FOR
DGS CONTRACT #800-290.2 HVAC [C]

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.2 HVAC, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.2 HVAC, Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G
BASIS OF BIDS
FOR
DGS CONTRACT #800-290.EL1.4 ELECTRIC

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed

B. All requirements specified hereinafter for DGS CONTRACT #800-290.EL1.4 ELECTRIC, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.EL1.4 ELECTRIC, Construction, complete and ready for use.

G-03 Basis of Bid For Bid Item No. 2

A. Bid Item No. 2, Alternate #3, shall be the lump sum deduct price to provide TP-1 efficiency in lieu of CSL3 efficiency for the low voltage transformers. Refer to specification section 26 22 00 for more detailed information.

G-04 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-05 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.

B. Omission of the name of the Surety Company may be cause for rejection of any proposal.

FOR

DGS CONTRACT #800-290.TL2.4 TELECOMMUNICATIONS (LOW VOLTAGE SYSTEMS)

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed.

B. All requirements specified hereinafter for DGS CONTRACT #800-290.TL2.4 TELECOMMUNICATIONS (LOW VOLTAGE SYSTEMS), Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.TL2.4 TELECOMMUNICATIONS (LOW VOLTAGE SYSTEMS), Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.

B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION G
BASIS OF BIDS
FOR
DGS CONTRACT #800-290.LA4.1 LANDSCAPING

G-01 General Requirements

A. Under the bidding items listed herein, the Bidders shall state, on the Form of Proposal, prices for each bid item listed
B. All requirements specified hereinafter for DGS CONTRACT #800-290.LA4.1 LANDSCAPING, Construction, shall govern, unless stated otherwise under any of the following Bid Items.

G-02 Basis of Bid For Bid Item No. 1

A. Bid Item No. 1, Base Bid, shall be the lump sum price for the entire work in accordance with the requirements specified hereinafter for DGS CONTRACT #800-290.LA4.1 LANDSCAPING, Construction, complete and ready for use.

G-03 Notice

A. The Form of Proposal (Section B) enclosed loose with the project specifications shall be used by Bidders in submitting their proposal.

G-04 Surety Company

A. Each Bidder shall note on the Form of Proposal (Section B) the name and address of its Surety Company.
B. Omission of the name of the Surety Company may be cause for rejection of any proposal.
SECTION H – SCOPE OF THE WORK [C]

SCOPE OF THE WORK

The scope of work per bid package shall be included, but not limited to, the work in the respective specification sections, project drawings, contracts, and addendums without exception. The bid packages are to include all labor, materials, tools, equipment, and supervision required to complete the work unless specifically indicated otherwise. Prime Contractor contracts will obligate every bid package to the entire set of construction documents obligating each bid package/prime contractor and their subcontractors to coordinate their respective scope of work for all aspects in which it may affect or be effected by.

Project Specific Requirements to be included for All Bid Packages

1. This project is scheduled to start in December 2010, and be complete by or before October 2012.
2. Unless otherwise noted, all references to the Construction Manager doing work on the site should be deleted. The work will be assigned to the trade responsible for that specification section per their scope of work. You must review the full list of bid packages for assignment of specification sections and scope.
3. Massaro Construction Management Services, LLC., the Construction Manager will be responsible for the initial installation of site fencing and gates, fence fabric, tree protection, site filter fabric and stone base, paving of temporary construction entrance drive and temporary walks, temporary plating of the utility trench (refer to section 11, Site Logistics Plan). The scope of work detailed above will be completed prior to the start of construction. Any disruption, disassembly, temporary removal, damage, etc after commencement of construction should be coordinated with the construction manager and it will be the responsibility of the prime contractor responsible for the action to restore each item to its original condition.
4. All contractors must comply with Massaro Construction Management Services, LLC. (MCMS) Safety Program and OSHA regulations.
5. Each bid package will be responsible for project accounting in accordance with the Project Manual.
6. The successful Contractor is required to sign a Prime Contract for the scope of work detailed in the bid package, without exception.
7. Each Prime Contractor responsible for a bid package must review the LEED Requirements for the project and include necessary documentation and field related work as required.
8. All Prime Contractors must be pre-qualified by Massaro Construction Management Services, LLC.; you must be pre-qualified before bidding. See further information in this project manual in regards to pre-qualification.
9. All work is “furnish and install” unless otherwise noted. If marked “installation only”, that respective bid package is responsible for unloading, protecting, and inventory of that material. If marked “furnish only”, the Contractor is responsible for all sales tax and freight to the site unless it is tax exempt as defined in Section 9.
10. All MEP Prime Contractors are responsible for applying and paying for their permits.
11. Each bidder must bid on the entire bid package without exception. Any exclusion may subject the bidder to disqualification.
12. All contract documents are available for review and purchase via an online plan room. All bidders must register with Massaro CM Services to gain access to the plan room. Bidders
should call Tim Jones (tjones@massarocms.com) at Massaro CM Services at 412-963-2800. In addition, once registered, bidders will receive all project notifications via email.

13. Normal working hours will be from 7:00 am to 3:30 pm, unless noted otherwise. Any work performed outside these hours must be prior-approved by the Construction Manager.

14. All Fire Protection, Plumbing, HVAC and Electrical Contractor will be required to provide coordinated drawings for this project utilizing BIM per Section H5 of this project manual. The HVAC Contractor will be the "lead" Contractor in the coordination effort.

15. Parking is not permitted at the site. Each subcontractor is responsible for transportation and parking for their employees. Refer to Section F of this manual for more info.

16. Each Contractor is required to comply with the environmental protection and quality control requirements in the specifications.

17. A consistent, competent person for each subcontract will be responsible to attend a weekly subcontractors meeting.

18. All contractors will be responsible for cutting and patching required for their work unless otherwise noted and also fire proofing/fire stopping of their penetrations.

19. All on-site testing required by the specifications will be performed and paid by the prime contractor responsible for that work and coordinated through Massaro CM Services. Each bidder is responsible to coordinate, schedule, and accommodate testing as required. Fire Protection, Plumbing, HVAC and Electrical Contractors are also required to perform and pay for all testing and/or certification requirements related to their various systems, equipment and/or fixtures as specified and/or required by Local Agencies.

20. Each contractor is required to provide the following temporary utilities:
   a. His own drinking water.
   b. Ventilation and humidity control required for his own work prior to building enclosure.
   c. Extension for temporary utilities (water and electric) from those points where these utilities will be placed on site designated for this construction project.
   d. Additional temporary lighting required for specific activities required for their work.
   e. Telephone/Internet service in his own field office.
   f. Plug in power cords and other temporary electric distribution required for your work.
   g. Electric service power from electric meter to your own field office.
   h. Portable generators required for field welding required for your own work.
   i. Telephone/Internet service use charges required for his own field office.

21. Massaro Construction Management Services, LLC. must approve all field offices, trailers, storage facilities and materials stored on-site.

22. No material hoists will be provided by the Construction Manager. Any necessary hoist or rigging equipment is the responsibility of the Prime Contractor.

23. Each Prime Contractor is required to provide the following support facilities if the scope of work dictates such:
   a. His own field office, if required.
   b. Storage and fabrication sheds required for your work.
   c. Tools, materials, and equipment storage required for your work.
   d. Dewatering, pumping, or surface water control required for his own work.
   e. Daily cleaning and housekeeping services required for his own work, to
the onsite dumpster.

f. Lifts and hoists required for your work.
g. Temporary construction openings required for your work.
h. Temporary use of the permanent elevator (when available) required for your work. If a contractor would like to use the elevator to transport materials, the contractor will be responsible for protecting and operating the elevator. A temporary elevator will not be installed for this project.
i. Construction aids and miscellaneous services and facilities required for your work.

24. Each Prime Contractor is required to provide the following security and protection facilities as required for the work in your bid package:
   a. Mud control
   b. Fall protection required for specific activities
   c. Barricades, warning signs and lights
   d. Pedestrian safety
   e. Temporary enclosures, including site fencing, barricades and plating (Section F) required for any work outside of main site fence as detailed on logistics plan (Section H3)
   f. Noise control
   g. Dust and fume controls
   h. First aid supplies
   i. Temporary protection of your work product
   j. Temporary Protection of existing work the may be affected by your work
   k. Environmental protection required
   l. Traffic controls

25. Each Prime Contractor is responsible for its own clean up and a proportional amount of the general clean up. The General Trades Prime Contractor will provide a dumpster. Contractors who are delinquent in their clean-up effort will be charged accordingly.

26. Each Prime Contractor is responsible for the protection of its own installed work.

27. Each Prime Contractor is responsible for the layout of their work. The General Trades Prime Contractor will provide reference points and benchmarks.

28. Each Prime Contractor is responsible for their own fire stopping. The MEP/FP contractors will collectively pick one product so that the same product is used throughout the project.

29. The General Trades Prime Contractor will be responsible for building and site housekeeping pads for the mechanical and electrical equipment. Anchoring plates or bolts must be supplied to the General Trades Prime Contractor by the bid package from which this equipment is furnished.

30. You must comply with the most stringent standard when two or more standards or conflicting standards are within the bid documents.

31. This is a prevailing wage rate project requiring certified payrolls. See specifications Section D1 for information on minimum wage rates $/hr to be used.

32. A mandatory pre-installation meeting will be held by the Construction Manager prior to the start of each activity of work where the proposed foreman or competent personnel must attend. This may include multi-trade coordination. See Section A for additional information.

33. All contractors providing components of the building exterior envelope must fully participate in the development and assembly of mock ups, demonstrating the
34. A mock-up of the exterior wall will be required. Mock-up requirements are included in the exterior systems relevant spec sections.

35. Each bid package is responsible to fully review existing conditions that will affect their bid package.

36. Owner Furnished Contractor Installed (OFCI) and Owner Furnished and Owner Installed (OFOI) equipment includes but is not necessarily limited to the following:
   a. Chilled water meter installed by HVAC Contractor
   b. AV Systems equipment and distribution in rooms 017 Multipurpose Event Space, 022 Lecture Hall, 022A MTSS Tech Work/Storage observation, 102 Classroom, 102a Classroom, 115 Conference Room, 232 Conference Room, 218 Conference Room, 311 Conference Room, and 412 Conference Room will be furnished and installed by the Owner. Raceways and projector mounts required for this equipment are by Electrical Contractor.
   c. Relocation of bridge telecommunications feeding Henderson North is by PSU. General Trades contractor to install underground conduit, see site utility drawing.
   d. Chairs for Fixed Seminar Tables in Lecture Hall 022 will be furnished and installed by PSU, fixed seminar tables by General Trade Contractor.
   e. All head end equipment and electronics for telecommunication systems to be both provided and installed by PSU.
   f. All residential appliances on the project (refrigerators and microwaves etc) are to be both provided and installed by PSU.
   g. Main service transformer and primary side connection and conductors by PSU. Secondary side conductors furnished by Electrical Contractor, connections to main service transformer by PSU.
   h. Digital Multi-Meter is provided and installed by PSU.
   i. Elm wood supplied by PSU. All coordination, transportation to and from PSU, milling, fabrication and installation by General Trades contractor.
   j. Toilet accessories (Toilet Tissue dispensers, paper towel dispensers, soap dispensers and trash receptacles) furnished by PSU. Required coordination, blocking and installation by General Trades contractor.
   k. AV and Distance Learning Systems equipment and distribution in rooms 116 Conference/Classroom, 312 Conference Room and 419 Conference Room will be furnished and installed by the Owner. Raceways for equipment are by the Electrical Contractor.
   l. Flat screen monitors, installation brackets and distribution for Lobby F001, Lobby F104, Corridor Q102, Lobby F201, Lobby F301 and Lobby F401 to be furnished and installed by the Owner. Required coordination, blocking and support framework in Lobby F301 by General Trades contractor. Raceways required for this equipment are by the Electrical Contractor.

36. All bid packages are responsible to adhere to the Division 1-General Requirements specifications. They include:

Bid Package 1 – HAZARDOUS BUILDING MATERIALS ABATEMENT DGS CONTRACT #800-290.HA1.1

Spec Sections:
Section H-6 of this Manuel
The Pennsylvania State University
Department of Environmental Health and Safety
Asbestos Containing Material Removal Performance Specification

1. Include abatement permit.
2. Inspect area to be abated.
3. All disposal of abated or demolished materials.
4. Selective demolition of fixed items encapsulating the asbestos, as required to accomplish your scope of work.
5. Temporary enclosures
6. Air monitoring and inspections will be by PSU. Refer to Section H6.
7. All asbestos abatement bidders must be prequalified by PSU. See requirements on OPP website at: http://www.opp.psu.edu/planning-construction/contractor-prequalification-information.

Bid Package 2 – BUILDING DEMOLITION, DGS CONTRACT #800-290.BD2.1

Spec Sections:

<table>

</tbody>
</table>

1. Temporary protection of structures or items to remain.
2. Include termination of existing electric, water, gas, or other utilities that may be present with existing bridge building. Contractor will be required to cut, cap, and make safe.
3. Removal of all demolished materials from the project site. No demolished materials from this operation should be placed in the construction dumpsters provided by the General Trades Contractor.
4. Any permits related to this scope of work.
5. Separation, as required, for materials that can be reclaimed or recycled. Provide proper documentation of these materials by weight.
6. Include selective demolition of brick, to be stored on site, in a quantity required to patch the openings created by demolishing the connection bridge. The masonry contractor will be responsible for cleaning and placing the brick.
7. All structural / facility demolition bidders must be prequalified by PSU. See requirements on OPP website at: http://www.opp.psu.edu/planning-construction/contractor-prequalification-information.
8. PA DEP and US EPA Demolition Notifications - Demolition contractor, not general contractor, is responsible for completion and submittal. Draft forms are to be submitted
to PSU EHS for review and approval prior to mailing to appropriate regulatory agencies. After approval from EHS, the demolition contractor shall submit to appropriate agencies and provide signed copies to EHS the same day, with proof-of-mailing. Demolition shall not begin until 10-working days after the approved notification is post-marked.

9. Demolition contractor is responsible for wetting debris from time of first contact until placing into appropriate waste or hauling containers or trucks. Debris shall not be allowed to dry before removal from site. Visible airborne dust is not permitted.

10. Demolition contractor is responsible for providing water tank / pump trucks if on-site water flow or pressure is not sufficient for operations.

11. Every effort has been made to identify and remove all asbestos from the facility prior to demolition. If suspect asbestos is discovered cease operations and notify OPP and EHS immediately.

12. If unusual stains or odors are detected in soils, cease demolition or excavation operations and notify OPP and EHS immediately.

13. All painted CMU, brick or concrete must be disposed as demolition debris at a PA DEP licensed landfill. These materials contain lead-based paint and cannot be reused at PSU or any other non-PSU sites.

14. Salvage of painted materials such as doors, windows, frames, moldings, etc. must be coordinated with EHS. End users of these materials must be provided with a Lead Paint Notification / Disclaimer before removing from PSU property.

15. Demolition contractor is responsible for building demolition in its entirety including any content left by owner inside building.

</table>
1. Architectural masonry finishes including mock ups as required. Mock-up construction and approval process will commence directly following notice to proceed. Mock-ups will be required for but not necessarily limited to match both the Henderson North existing unit masonry, stone masonry and mortar and the Henderson South mortar (bridge infill only – harvested brick from bridge building demo). Refer to specification sections for further details. The review and selection process will be thorough and may involve multiple iterations.

2. Furnish and install sealers and hardeners as specified and on the finish schedule.

3. Include vapor barrier under slab on grade as specified.

4. Include winter/ inclement weather provisions as required by the construction schedule.

5. Grout leveling plates, beam pockets, elevator seals, or other items.

6. Install anchor bolts and any other embedded items supplied by Structural and Misc. Steel bid package.

7. Set and grout any bollards.

8. Furnish and install all reinforcing steel embedded in your concrete.

9. Dewatering as required to accommodate your operation.

10. This package is responsible for transformer pads, sidewalks, curbs, generator pads, or any other MEP Pads including reinforcement.

11. Review slab elevations to verify recessed slabs to accommodate floor finishes.

12. Coordination with the waterproofing contractor and MEP’s for horizontal waterproofing membrane, penetrations, and finishes at exterior plaza above the auditorium.

13. All waterproofing membranes will be furnished and installed by General Trades Contractor.

14. Infill of metal pan stairs and placement of stair nosing’s if required.

15. Include any add mixtures per the specifications and to meet you means and methods.

16. The General Trades Contractor will include all joint sealants for this project.

17. It is assumed footings will need to be formed.

18. Furnish and install any cavity wall insulation, flashings, and waterproofing membrane in the cavity wall.

19. Set all lintels.

20. All flashings required for your work.

21. Furnish and Install all reinforcing steel with your scope of work including any welding that may be required.

22. Grout masonry door frames.

23. Furnish and install all masonry anchors required by your scope of working including any welding that may be required.

24. Interior brick and limestone walls including benches and interior stone flooring.

25. All equipment required for off loading and erection including welding must be included in this bid package.

26. Include BIM as a part of this bid package in accordance with Section H5 of this
27. Special coatings as specified.
28. Pour stops at all edge of slab conditions.
29. Furnish and install all anchor bolts, base plates, embedded steel, temporary edge protection, railing sleeves, and provide final anchor bolt plan noting any deviations from the construction documents.
30. Furnish and install perimeter fall protection cables as required by OSHA including, but not limited to the perimeter of the building at the floors, shafts, elevators, and stairs. Maintain while on site and include final removal.
31. Verify the need for primed steel vs. fireproofing requirements.
32. Include all steel that is welded or bolted to the structural steel.
33. Include elevator sill angles, hoist, rail, and divider beams.
34. Include all site and building guard, and hand rails. This is a performance specification item and will require a licensed structural engineer’s sign and seal.
35. Furnish and install all lintels.
36. Include all steel exposed to the elements to be galvanized unless noted otherwise in the contract documents. This is a performance specification item and will require a licensed structural engineer’s sign and seal.
37. Furnish and install all ladders. This is a performance specification item and will require a licensed structural engineer’s sign and seal.
38. Foundation wall waterproofing and insulation/drainage board.
39. Elevator pit waterproofing
40. Flashing required at transitions and wall penetrations.
41. Wood sheathing and dimensional lumber are by General Trades Package.
42. All blocking for roof accessories are by the General Trades Contractor.
43. Include flashing at all MEP curbs, drains, vents or other penetrations.
44. Horizontal and vertical insulation under your roofing systems as specified.
45. All flashings, expansion, scuppers, spout, trims, copings, riglets, or accessories required for you scope of work.
46. Furnish and install fire rated shutters including coordination with the fire alarm system provider.
47. Include hardware required for proper operation.
48. Include exterior caulking for all work in the bid package.
49. Include coordination with the electrician for distribution and termination of cable for door hardware.
50. Any glass or mirrors in casework to be furnished and installed by General Trades Contractor.
51. Any door operators will be furnished and installed by this bid package including low volt wiring. Power to the units is the responsibility of the electrical contractor.
52. Include all gypsum based sheathing, wood sheathing and blocking within your scope of work.
53. Linear and panel wood ceiling systems.
54. All suspended acoustical ceiling systems.
55. Wall and ceiling expansion joint assemblies.
56. Tile backer board, as required.
57. Waterproofing/crack suppression membrane per the specifications.
58. Stone flooring.
59. Interior limestone benches, wall wainscot, and brick walls.
60. Thresholds or transitions as required.
61. Floor mats and frames will be furnished and installed with this bid package.
62. Provide flooring for elevators, as required.
63. Machine Roomless Elevator, General Trades contractor will provide complete elevator package including all wiring from elevator to disconnects in elevator machine room.

64. Include one set of wall protection cloths per cab.

65. Include coordination with other life safety trades as required.

66. Obtaining Labor and Industry approvals.

67. Install and maintains E&S for the duration of the project. Removal by others.

68. Stone bedding of the project site as noted in the construction documents will be provided by Construction Manager and removed by the General Trades contractor.

69. Perimeter construction fencing, temporary fence lighting and tree protection fencing will be installed and removed by Construction Manager. These items will be maintained by the General Trades Contractor for the duration of the project.

70. This package is responsible for installation of shoring. As a part of the backfilling operation remove the top 4’ of the temporary shoring system.

71. All site paving, sidewalk, and curb demolition as indicated on the construction documents.

72. All site signage is by General Trades Contractor. Temporary safety or protection signage and fence at trenches are the responsibility of the subcontractor creating the trenches.

73. Include all mass and structural excavation as required. All excavation spoils to be hauled to an offsite location. Obtain any regulatory approvals required for any offsite spoils removal.

74. Rock excavation is unclassified.

75. Include foundation backfill with foundation drainage system.

76. Include two well points in the excavation to be maintained under this subcontract until the foundations are completed.

77. This bid package will be responsible for street cleaning for the project duration.

78. Establishing rough grade is the responsibility of this package. The landscaping contractor is responsible to spread the stockpiled topsoil and complete the seeding.

79. Furnish and install all stone subbase for site and building concrete.

80. Include all asphalt paving, subbase, and line stripping.

81. Include snow removal from the construction roadways, staging area, building entrances, and job trailers for the project duration. Stockpiling of snow on site will not be permitted.

82. Spoils created by temporary shoring operation.

83. Stockpile topsoil on site at designated location. The General Trades Contractor will be responsible to provide all topsoil need for this project. If the estimated top soil on site for stockpiling does not meet the need for completing the project the General Trades Contractor will be required to furnish additional topsoil to complete the project. Any imported topsoil will need to meet the requirements of the contract documents for topsoil.

84. Include all site demolition and restoration as required for your work.

85. Include stone backfill to subgrade for all utilities under paved walk or drive areas.

86. Site lighting will be installed by the electrician in it’s entirety including, but not limited to trenching and backfill, conduit, pole bases, poles, and fixtures.

87. Include concrete encased ductbanks as noted on the construction documents for all tele/data/communications and electrical utilities. Include pull strings as required for the electrical subcontractor to pull required cable.

88. The General Trades Contractor will furnish and install all access panels for this
project. Location and sizes to be coordinated between trades with final approval for both location and size by Project Architect and Construction Manager.

89. General Trades Contractor is responsible to furnish and install Site Furnishings including handrails, vehicular bollards and pedestrian bollards-post and chain.

90. Shoring piles must be predrilled to mitigate potential damage to adjacent structures and utilities.

91. It is our opinion that tie-backs will not be an option due to the relatively close proximity to existing structures, new and proposed utilities. Please do not include tie-backs as a part of your design. Please notify CM prior to deadline for RFI's if this poses any issues in the design.

92. Responsible for design and adequacy of the shoring.

93. The General Trades Contractor will tie into the building storm, sanitary, water and gas within 5’ of the building perimeter and the tie-in will be part of this scope of work. Locations to be coordinated during construction.

94. The General Trades Contractor will be required to stub all steam, condensate and chilled water piping into the building 1’ and provide a flanged connection for the HVAC Contractor. All sleeves and seals/gaskets for this work to be furnished and installed by the General Trades Contractor.

95. The General Trades Contractor shall include; engineering of steel connections and performance specified items for reactions shown on drawings, engineering and coordination of all stone supports, engineering of site walls/site stairs/waterstops in concrete and all coordination/engineering requirements/responsibilities associated with the building structure.

96. The General Trades Contractor shall furnish and install all site walls, limestone steps/seatwalls, paving (concrete, brick and granite) curbs, sidewalks, asphalt paving, site concrete stairs, site caulking, site painting and protection of existing field stone wall as required by the contract documents.

97. The General Trades Contractor should coordinate the location of all sleeves, openings, depression locations and sizes with other trades.

98. This bid package is responsible for the demolition (including cut, cap & make safe) of existing site utilities outside of bridge building, and coordination, trenching, backfill, piping, and structures for the following new systems:
   a. Storm and storm retention
   b. Sanitary sewer
   c. Water
   d. Gas
   e. Steam and condensate
   f. Chilled water
   g. Electrical primary and secondary ductbank
   h. Tele/data/communications
   i. Temporary utility relocations (includes but not limited to, natural gas & telecom conduit feeding Henderson North)
   j. Existing site steam tunnel restoration & repairs (ref dwg. C8.11) and temporary protection
   k. Two (2) 12” schedule 80 PVC raceways and handholes for stage feeds w/ pull string (reference drawing C5.02),
   l. Irrigation storm overflow from cistern, outflow and rain water filters
   m. All manholes, vaults, trenches, tunnels, inlets and sumps associated with site utilities

99. General Trades contractor owns all infill and restoration (including but not limited to masonry, windows, structural, joint sealants, flashing, doors and partitions) after demolition of bridge building in Henderson North and South as shown on
the Architectural Demolition drawings. Coordinate with Demolition contractor for salvaged masonry. This work to also include insulated, temporary infill and any Signage required.

100. General Trades contractor to coordinate with the University and the Construction Manager for the procurement and use of existing Elmwood as indicated on the architectural drawings and detailed in the specifications.

101. Per RFI PC133 - Site Utilities including water are by the General Trades Contractor. The General Trades Contractor should plan directly after contract award to complete installation of the water main 10"x 10"x 8" tee off the existing 10" line (see C5.02) along with the shut off valve. At the time of this installation a water meter should be installed for temporary water for contraction and the tire wash. The feed for the tire was should be installed underground by the General Trades Contractor. The routing (from the meter set) would be underground south to the the steam tunnel, (penetrate the steam tunnel and temp. seal the penetration) once in the steam tunnel run the line east in the tunnel to the location of the temporary truck wash (see Logistic Plan, Section H3, page 3, south east of the new building). Once again penetrate the steam tunnel for use at the truck wash. Truck wash piping inside the steam trench should be continuous (PEX type) or soldered copper and heat resistant to the temperatures inside the steam trench. The General Trades Contractor should protect the water meter and associated piping from freezing and damage from construction. All truck wash piping will be removed at the end of the project and trench penetrations patched by the General Trades Contractor. [C]

Bid Package 4 – FIRE PROTECTION SYSTEM, DGS CONTRACT #800-290.5

1. Site water, sanitary, storm, and gas utilities are a part of General Trades bid package. HVAC/Plumbing bidders interested in this scope of work are encouraged to submit on the site utilities package as well.
2. Include BIM as a part of this bid package in accordance with Section H5 of this Project Manual.
3. Permits and fees required for your scope of work.
4. Plumbing Prime Contractor will extend all storm, sanitary, gas, and water piping to a minimum of 5’ outside the building perimeter including sleeves and seals/gasketing to make the building water tight. Final Location to be coordinated during construction.
5. Include all firestopping for your work.
6. The General Trades Contractor will furnish and install all access panels for this project. Location and sizes to be coordinated between trades with final approval for both location and size by Project Architect and Construction Manager.
7. The Plumbing Prime Contractor is responsible to provide dedicated, valved stub piping with backflow prevention off main piping (sized correctly) inside the building mechanical room for all irrigation and water feature feeds. Location will be coordinated during construction.
8. Site and building concrete equipment pads are to be completed by others.
9. Full coordination with the electrical contractor as well as detailed device and system drawings to clearly define the devices to be wired by the Electrical bid package.

1. The HVAC Prime Contractor will tie into a flanged connection stubbed either through the wall or floor for connection of the building mechanical piping systems. Site steam and condensate, and chilled water utilities are a part of General Trades bid package.
2. Include BIM as a part of this bid package in accordance with Section H5 of this Project Manual.
3. Permits and fees required for your scope of work.
4. Include all firestopping for your work.

5. The General Trades Contractor will furnish and install all access panels for this project. Location and sizes to be coordinated between trades with final approval for both location and size by Project Architect and Construction Manager.

6. Include ATC/BAS requirements provided by either Automated Logic (Pittsburgh) or Johnson Controls (Harrisburg).

7. Include all louvers and vents whether mechanical or not. The intent is to have all interior and exterior grills, louvers and vents come from the same supplier/manufacturer.

8. Furnish and install all rooftop curbs. Coordinate locations with steel fabricator and roofing contractor.

9. Site and building concrete equipment pads are to be completed by others.

10. Full coordination with the electrical contractor as well as detailed device and system drawings to clearly define the devices to be wired by the Electrical bid package.

11. The HVAC prime contractor is responsible for locating and installing all duct smoke detectors. Duct detectors provided by others.

1. Site electrical and tele/data utilities are a part of General Trades bid package and include trench, backfill, compaction, spacers, conduits, pull strings, concrete encasement, warning tape, etc. It is the responsibility of the Electrical Contractor to coordinate locations with the General Trades utility subcontractor and to furnish, install and pull all wire and cable, provide all testing and make final terminations as required. It is also the Electrical Contractor’s responsibility to install the secondary feeds from transformer to building with terminations inside building. PSU to provide and install transformer and primary feed. All terminations at transformer by PSU. Electrical contractors responsibility to provide all conduit, wiring sleeves, seals from transformer to building main electrical room. The building transformer will be provided by others.

2. This bid package is responsible for the entire exterior lighting system including, but not limited to, trenching, backfilling, conduit, concrete pole bases, all site fixtures and all site wall fixtures. Coordination between the Electrical Contractor, General Trades Contractor and Landscape Contractor will be required for installation of the site lighting.

3. Include BIM as a part of this bid package in accordance with Section H5 of this Project Manual.

4. Permits and fees required for your scope of work.

5. Include all firestopping for your work.

6. The General Trades Contractor will furnish and install all access panels for this project. Location and sizes to be coordinated between trades with final approval for both location and size by Project Architect and Construction Manager.

7. Include temporary lighting of the building in accordance with PA UCC and OSHA requirements. This lighting will remain the property of the electrical subcontractor once the permanent lighting is operational. All temporary lighting and feeds must be removed from building once permanent system is operational.

8. Include temporary electrical service including transformer and distribution of a 480 volt, three phase service from a point shown on the site plans. Extension of this service to one (1) 200 amp sub-panel per floor with 120 volt quadplex receptacles located throughout the floors per OSHA Standards.

9. Electrical Prime Contractor will be responsible to remove all existing site lighting and make safe. Return the light fixtures and poles back to PSU for storage. Below grade demolition of conduit, if required, will be by the General Trades Contractor.

10. Site and building concrete equipment pads are to be completed by others.

11. This bid package is responsible to furnish and install Site Furnishings including, emergency call box including all electrical and voice/data/security requirements.

12. Electrical Prime Contractor will furnish and install all Telecommunications raceways, conduit, sleeves, boxes and cable trays for the installation of the Telecommunications cabling. All miscellaneous hangers and supports should be furnished and installed by the Telecommunication Prime Contractor.
13. Electrical Prime Contractor should furnish and install 120V power, grounding, ground bars and back boards for all Telecommunications equipment. Cabling and final connections for all Telecommunications equipments is by Telecommunications contractor.

14. Stage power supply shown on L3.1 and L4.3 will be provided and installed by electrical contractor including panel boards, raceways, cabling, devices and terminations. Coordinate with general trades contractor. Wall, screen and Neenah trench with cover by general trades contractor.

15. Electrical prime contractor to provide and wire all duct smoke detectors. Installation by HVAC contractor.

16. Electrical Prime Contractor to provide elevator disconnects including shunt, feeds to disconnects and final connections in elevator machine room.

17. Electrical Prime Contractor is responsible for the reacceptance testing and rerouting of the fire alarm system due to bridge demolition. Coordinate with PSU/ MCMS.

1. Raceways, conduit, sleeves, boxes and cable trays for the Telecommunications cabling will be furnished and installed by others. All miscellaneous hangers and supports should be furnished and installed by the Telecommunication Prime Contractor for completion of the work associated with this bid package.

2. Telecommunications contractor should furnish and install sleeve seals as detailed in the contract documents.

3. 120V power, grounding, ground bars and back boards for all Telecommunications equipment is by others. Telecommunications contractor will make all final connections to equipment provided under this section.

4. The General Trades Prime Contractor will furnish and install the site telecom conduits as detailed on site utility drawings. The Telecommunications Prime Contractor will be responsible to furnish and install all site cabling from the existing building to the main telecom room inside the new building.

5. Telecommunications Prime Contractor will furnish and install all tele/data and cable TV cabling including terminations, devices, equipment, racks, patch panels and complete punch-down as detailed in contract documents.

6. Telecommunications Prime Contractor to coordinate all installations with the Constructions Manager and Owner.
7. The General Trades Contractor will furnish and install all access panels for this project. Location and sizes to be coordinated between trades with final approval for both location and size by Project Architect and Construction Manager.

8. Include BIM as a part of this bid package in accordance with Section H5 of this Project Manual.

9. All Telecommunication bidders must be prequalified by PSU. See requirements on OPP website at: [http://www.opp.psu.edu/planning-construction/contractor-prequalification-information](http://www.opp.psu.edu/planning-construction/contractor-prequalification-information).

Bid Package 9 – LANDSCAPING, DGS CONTRACT #800-290.LA4.1

</tbody>
</table>

2. Install topsoil stockpiled on site and finish grade soils to meet requirements of contract documents. The General Trades Contractor is to initially stockpile topsoil and make-up any shortage. The Landscape Prime Contractor will spread from the stockpile throughout the site.

3. Include seeding as specified.

4. Furnish and install roof garden soil and plantings as required including the grade level plaza above the auditorium and elevated roofs. This package is responsible for hoisting or conveying of those materials. The roof system supplier must approve the green roof components by others so that the roofing warranty requirements are met.

5. Furnish and install the complete irrigation system as indicated on the construction documents (including cistern, rainwater filters and all other interconnecting piping and diverter). The Plumbing Prime Contractor will provide dedicated, valved, stubs with backflow prevention off the main water line in the mechanical room. It will be the responsibility of the Landscaping Contractor to complete the irrigation system in its entirety from the stub in mechanical room including all piping, fittings, insulation, hangers, controller, heads, trenching, backfill and protection of system for the duration of the project. The Landscape Contractor will also be responsible for piping and connection to the storm piping since the primary irrigation water will be grey water from the roofs (potable water is the back-up system). Location for storm piping connection must be coordinated with Plumbing Contractor / General Trades Contractor and approved by Architect.

6. Site Pavers furnished and installed by others.

7. Landscaping Contractor is responsible to furnish and install Site Furnishings including benches, seating and tables, bicycle racks and trash receptacles.

8. Landscaping Contractor to furnish and install water fountain/feature in its entirety as detailed on contract documents including all feeds, tie-in and final connections.

9. Include lawn and plant maintenance as specified.

10. Landscape Prime Contractor will be required to submit unit pricing (within 30 days of receiving a contract) for plant material type and size to the Construction Manager.

END OF SECTION
SECTION H1 – GENERAL SCOPE OF THE WORK

GENERAL SCOPE OF THE WORK

1. This Contractor understands that this project has LEED Certification requirements and will comply with all requirements of the LEED Program as established by the Architect.

   a. The General Trades Contractor will provide a trash chute for debris removal that will serve the 2nd, 3rd and 4th floors of the new building.

   b. The General Trades Contractor will also provide all debris dumpsters for the duration of the project. All debris both construction and otherwise will require sorting and documentation to satisfy the LEED requirements.

   c. Dumpsters supplied by the General Trades Contractor should be general purpose dumpsters with LEED sorting taking place at a facility off site. No more than two dumpsters will be permitted on site at any given time. Rotation must happen in a timely manner so as to not delay debris removal from the building. Dumpster rotation should be coordinated with the Construction Manager. All dumpster receipts detailing specific debris contents as required by LEED should be submitted weekly to the Construction Manager.

2. This Contractor understands that this project is NOT an Owner Controlled Insurance Program (OCIP).

3. This Contractor understands that Pennsylvania Prevailing Wage Scale is a requirement of the Contract and has thoroughly reviewed and has included the current prevailing wage rates and the daily Submissions of certified payroll. (See Section D1 – Prevailing Wage Requirements)

4. If the Contractor shall fail to properly perform its work in a timely manner as a result of which the completion of the Project is delayed, Contractor shall also reimburse Massaro CM Services, LLC (MCMS) for any and all liquidated damages that may be assessed against Massaro CM Services, LLC. Massaro CM Services, LLC shall have the right to apportion such liquidated damages among Contractor and any other Contractor or other parties responsible for such delays whether or not concurrent or consecutive.

5. The Contractor has carefully examined the drawings, read the specifications and all other contract documents and visited the site of the work. The Contractor has fully informed himself/herself as to all existing conditions and limitations under which the work is to be performed and included a sum to cover all costs of all items necessary to perform the work as set forth in the contract documents. No allowance will be made to any Contractor because of lack of such examination or knowledge. The execution of this contract is construed as conclusive evidence that the trade contractor has made such examinations.

6. Adhere to The Pennsylvania State University guidelines and procedures addressed in PSU’s “Initial Job Conference Guide” package.

7. In the event of discrepancies or differences between bid documents/governing authority regulations/building codes, standards, etc., the more stringent requirement shall apply. (example: if the bid documents call for a specific type of electrical device but the latest edition of the applicable electrical code for this project calls for an enhanced device, the enhanced device should be supplied)

8. After bids are received, contractors will need to attend a scope review meeting with Massaro CM Services, LLC, the Owner, and the Architect.
9. Each contractor, upon award, is to forward a schedule of values for each individual item of work, in s.f. or l.f. costs for accounting daily.

10. The safety of the University’s construction personnel, employees, students, faculty and visitors is of the highest level of importance to PSU and Massaro CM Services, LLC. There will be zero tolerance for trades people that do not respect behavior and safety rules to allow for a good working environment. Contractor understands that their employees will be required to participate in the PSU/MCMS safety program, including 1st day orientation, weekly safety meetings and maintaining safe work practices. Contractor shall take protective measures necessary for the safety of workmen, the public, and adjacent property. All safety measures shall comply with the regulations of all State and Local authorities having jurisdiction, including all applicable OSHA requirements, MCMS Safety Rules, PSU Project Safety Plan and at MCMS’s direction. Contractor shall abide by all current regulations and procedures regarding Confined Space Safety Practices and Fall Protection. Employee’s failure to comply with safety and good behavior on site will ultimately result in expulsions from project. Each Contractor will be required to designate in writing an on-site safety representative. Progress payments cannot be released until MCMS has received this letter. This Contractor will be required to submit MCMS a copy of their site specific Safety Program.

11. This Contractor’s equipment that operates by internal combustion and is on site for more than a one-week period shall be equipped with an exhaust scrubber to reduce emissions and muffler to minimize noise.

12. Jobsite security and security of materials is the responsibility of the Contractor, not MCMS.

13. All openings created by this Contractor shall be this Contractor’s responsibility to protect and maintain same with OSHA approved protection until closed in or permanent protection has been installed. Temporary barricades shall be placed and maintained by the Contractor creating the hazard, or when necessary to facilitate the next sequence of construction. The Contractor responsible for the next sequence of construction is then responsible for the barricades (and the ultimate removal of same) if a hazard still exists. The Contractor who disturbs barricades shall restore them to meet safety requirements, at their own expense. The “barricades” applies equally to all safety, weather, and dust protection provisions. MCMS shall have the right to determine the suitability of barricades.

14. This Contractor will abide by all traffic restrictions set forth by the Owner. There will be no parking available on site for Contractors. Parking will be available at a designated parking lot on the PSU campus. This Contractor will be responsible for parking permit costs and shuttling employees from the designated parking lot to the jobsite.

15. Applications for payment shall be submitted to MCMS no later than the 24th of each month. Payment will be for work in place by the end of the month, and should be projected to reflect this.

16. Each Prime Contractor must have a line item in their invoice “schedule of values” that allows 3% of the total contract amount for close-out documents (as-builts, warranties, operations and maintenance manuals, punch-lists, etc.).

17. Drinking water facilities will not be provided by MCMS. All contractors are to provide for their employees.

18. Provide all submittals including, but not necessarily limited shop drawings, catalog cuts, samples and record drawings in accordance with the specifications. All LEED documentation should be submitted as part of the initial submittal. Contractor shall first review each submission, make changes or notations as necessary to conform to contract documents directly on the shop drawings, identify such review with an approval stamp, and forward to
Massaro CM Services. Massaro CM Services will not review any shop drawings not reviewed by and bearing the contractor’s approval stamp, signature, and date. Electronic submission will be a requirement of this project. The electronic submittals (in .pdf format) will be submitted via Massaro CM Services’ Prolog Converge website. All primes will be provided user accounts for Prolog Converge. Contractor will provide four (4) copies of field use drawings to Massaro CM Services after approval. All primes are responsible for the printing of any hard copies needed for their field personnel.

19. All submittals shall be submitted no later than 4 weeks from the date of award unless otherwise stated.

20. Furnish attic stock as required by the drawings, specifications, or the scope of work.

21. MCMS will not provide jobsite office/storage trailers, nor utilities for the same. Contractors will not be permitted to use MCMS’s or the Owner’s phones.

22. Notify MCMS of any major deliveries at least five (5) days prior to said delivery.

23. Should this Contractor need to work on off hours to maintain contract schedule or cause another Contractor to work off hours which requires standee personnel (including MCMS and Contractor’s), this Contractor will be responsible for cost of same. If this Contractor fails to complete their work per the schedule time allotted and this delay causes the overall project schedule to be delayed, this contractor will be responsible for any impact cost or liquidated damages.

24. This Contractor has included all rigging, hoisting and stocking of materials and removing debris as required to complete their work and so as not to interfere with the Construction Operation. Any rigging or hoisting over occupied areas must be scheduled at least two (2) weeks in advance and is subject to MCMS’s approval. No lifting over any areas which are occupied by the construction employees, visitors, guests, etc., will be allowed at any time.

25. Scaffolding, lifts, cranes, and other means of access for own work are the responsibility of the Contractor unless specifically excluded in the subcontract. Basic access to the site will be provided. Do not overload roofs or floors.

26. As built record drawings as well as operating and maintenance manuals shall be assembled by this Contractor and submitted in accordance with the specifications. In addition, to what is required by the specifications all close out and as built documents are to be submitted in electronic form (“pdf” format for 11” x 17” documents or smaller and CADD for drawings).

27. Provide any and all precautionary measures required to protect your work and other adjacent work against damage. The cost to repair any damage (to existing or new) finishes will be split among all contractors working in that area unless specific contractors can be identified. Temporary Construction Fence will be provided by others. This Contractor will be responsible to relocate and re-install the construction fence as necessary to complete their work and must notify MCMS 48 hours prior to commencement of work.

28. This Contractor shall have an office representative (not only a foreman or project superintendent) attend MCMS’s weekly progress meeting. It is suggested that the Field Foreman also attend to assist the office representative and aid in communication during the meeting. Contractors will be required to attend the progress meetings two (2) weeks prior to their work commencing, during the duration of their work and two (2) weeks after their work is substantially complete. Contractor’s representatives are required to be on time and remain until the meeting has been concluded by MCMS. Contractor will be held responsible for the outcome of the meeting whether in attendance or not. Any Contractor not in attendance or not present for the entire meeting will be charged $100.00 per occurrence which will be
deducted from their contract amount. All Contractors performing work on the project are also
required to attend the weekly progress meetings as defined above. The representatives to
the meeting are expected to make commitments with regard to schedule and cost during the
construction process. Contractor shall maintain on-site supervisory personnel capable of
making construction changes as needed, attending foreman’s meetings, and having a
complete understanding of the requirements of the job.

29. This Contractor will perform all engineering and layout required for this Contractor’s work.
The Owner will provide vertical control (benchmarks) and horizontal control (building center
lines). The Contractor shall perform all other vertical/horizontal control required to complete
their scope of work.

30. Time is of the essences on this project. Contractor is responsible for all efforts, methods,
procedures, and cost to meet or better the project schedule dates. This Contractor has
included shift and/or premium time as required to maintain the project schedule. Provide all
necessary remobilizations to complete their scope of work.

31. MSDS are required to be on file with MCMS prior to commencing any fieldwork. It is this
Contractor’s responsibility to keep current all MSDS and inform tradesmen of the location of
same. All MSDS will be on file in MCMS’s jobsite office and Contractor’s office.

32. Pricing for additional work or credits shall be submitted within one (1) week unless it is judged
by MCMS to be a major revision for which MCMS will establish the due date. If pricing is not
submitted as stated above, then MCMS may submit an estimate for this Contractor on their
behalf. If the overall Pricing is accepted by the Owner, then this Contractor’s price for that
work will not exceed MCMS’s estimate.

33. All change order pricing must be accompanied by a labor and material breakdown and with
Contractor and Vendor quotes.

34. Normal working hours shall be 7:30 a.m. to 3:30 p.m. unless otherwise directed by MCMS.
This Contractor understands that this project site is adjacent to other campus buildings and
noise, dust and behavior control are of the highest importance to PSU and MCMS.

35. This Contractor shall provide a minimum of one (1) year warranty unless specified as
elsewhere in the contract documents.

36. Independent quality testing and inspections and system commissioning are by others. This
Contractor must cooperate with MCMS to provide access and maintain the schedule for item
and occurrence for all testing and inspections. This Contractor must notify MCMS in writing at
least two (2) weeks in advance when testing and inspection are required. Contractor is
responsible for coordination of site inspections with both the applicable governmental
agencies and MCMS.

37. All materials, products and/or equipment furnished on this project shall be asbestos and PCB
free. Any subcontract this Contractor shall issue shall include the same phrase as above.

38. The omission from the drawings and/or specifications of any minor details of construction,
installation, material or essential specialties shall not relieve the Contractor from furnishing
the same, in place, complete and such omission shall not entitle the Contractor to make
claims for extras on material or labor after the award of contract.

39. This Contractor will “make safe” all hazardous, unsafe conditions caused by this Contractor.
40. No gasoline-powered equipment can be used at any time within buildings, use propane instead. All equipment you plan to use must be reviewed with the Superintendent for safety and noise concerns.

41. Where new construction occurs in fire-rated walls, floors, and/or roof, materials used shall be sufficient to maintain fire rating.

42. Contractor shall submit Daily Field Reports and Weekly Safety Meeting Minutes to MCMS Superintendent. These reports must indicate manpower by craft, quantities of work installed, detailed explanation of work performed or topic of discussion.

43. Contractor shall attend, as required, any meetings with Campus, Local, and State Authorities pertaining to their work. The Contractor shall perform all work in compliance with Local, State, and Federal building codes.

44. Contractor will coordinate all work with other trades and MCMS’s schedule. No claim for compensation by Contractor will be allowed for improper coordination.

45. Contractor includes any cutting and patching as required to perform their work. Include restoration of surfaces to original condition to include firestopping/firesafing if required.

46. This Contractor is responsible for all sleeves, inserts, anchors, and any additional reinforcements or supports for this work which is not detailed in the drawings.

47. Abide by all directions of the Fire Department in matters affecting life safety and fire prevention measures.

48. During this project, hot work permits will need to be obtained from MCMS prior to proceeding with any such work on a daily basis.

49. MCMS/Architect/Owner has the right, at no additional expense, to reject any material brought on site which does not conform to local, state, or national codes and/or which does not conform to the drawings and specifications. Any such material used on site shall be immediately removed and replaced at Contractor’s expense.

50. This Contractor shall coordinate and sequence his work with MCMS’s schedule, as outlined on Attachment 4 as well as reasonable short term scheduling needs. Time is of the essence, and therefore, the Contractor agrees to provide a sufficiency of workers to expedite the completion of all work made available to him. Furthermore, he shall work overtime as necessary, at no charge in cost, to make each scheduled completion date. (See section H2 for the schedule.)

51. Provide protection of new and existing work to prevent damage by own work.

52. This Contractor is responsible for all applicable use and excise taxes. This project is not tax exempt.

53. Obtain and pay for required applications, permits, and services necessary to complete the work associated with this contract.

54. Contractor shall not proceed with any work he deems as extra work, without written approval from MCMS. If Contractor proceeds without written approval, he does so at his own risk.

55. Your Contractors must be listed in the bid form. All Contractors must be state licensed and insured.
56. Building or site commissioning is to be performed separately from owner training.

57. All punch list work and project closeout documentation shall be completed and approved by the Owner and Architect by the "Date of Final Completion" which shall be no later than 14 days after the Date of Substantial Completion. Any uncompleted punch list items after this date will be completed by MCMS and back charged to the appropriate Contractor or vendor. Final invoices will not be processed until final completion of the work and certification of same by MCMS, the Owner, and Architect.

58. Any potential material or wage escalation costs for the life of the project. To the extent possible, Contractor will work with Construction Manager in an effort to try to identify onsite storage accommodations for pre-ordered materials. If onsite storage cannot be accommodated, Contractor will be responsible for storing materials off site.

59. The requirement to meet all required manufacturer and specified material requirements.

60. All necessary traffic control measures required for the safe prosecution of the Work.

61. Contractor shall provide all shoring and bracing as required to perform scope of work.

62. Place a “PA One Call” prior to starting any excavation. Prior to commencement of an excavation for the project duration a current One Call should be completed. “PA One Call” receipts should be forwarded to MCMS for record.

63. Contractor shall enter and exit the site via only designated entrances. These entrances will be subject to change depending on the status of construction.

64. Contractor is responsible for providing any office space required to manage their on-site operations. Space is very limited and space for office trailers or shanties on site will not be allowed unless approved by the Construction Manager. Construction Manager will also approve the size and duration that the trailer will be allowed on site.

65. Contractor shall provide required fire extinguishers at work stations, gang boxes, shanties, and storage areas and at work locations where flame producing procedures are used.

66. Each Contractor shall remove all snow and ice as may be required for the proper protection and timely execution of his Subcontract.

67. During the construction, the Contractor may install temporary building enclosures in openings to provide weather protection. Contractor is responsible to replace the enclosure if it is removed/damaged by their actions.

68. For the purposes of this Subcontract, the term “provide” shall mean “furnish and install complete.”

69. The Contractor has read and fully understands the requirements of the Disadvantage Business Enterprise (DBE) Program for the project.

70. Building Information Modeling (BIM) will be used on this project. The purpose of using BIM on the PSU Henderson Behavioral Health Building is to supplement the coordination process between trades and design disciplines. Contractors will be required to fully participate in the BIM process from the start of coordination drawings to the completion of the project and as-builds. (See Section H5)

71. Once complete, the building elevators are not to be used at any time during this project. All trades are to provide for their own hoisting.
72. Contractors are to submit all submittals and shop drawings in an electronic format through Prolog Converge, a web-based collaborative tool. Contractors will be provided user accounts. Each Contractor will be responsible for a $75.00/month fee payable to Massaro CM Services.

73. Contractors will use Prolog Converge to electronically submit all RFIs, Submittals and Daily Reports to the Construction Manager.

74. PROJECT CLEAN-UP REQUIREMENTS:

   A. This Contractor shall perform daily and final cleanup as directed by MCMS. Trash generated from Contractor daily operations will be sorted and will be put in to designated dumpsters for removal to recycling facility. Final cleanup shall be defined as removing all of this Contractor’s excess material debris generated by this Contractor’s work and their “gang” boxes at the end of a completed area of work and as directed by MCMS. No janitorial services shall be performed by the Construction Manager.

   B. Every firm, regardless of crew size, is to clean up their work area on a daily basis.

   C. In addition, one day a week the Construction Manager will coordinate and assemble a composite clean up crew consisting of one person from each Contractor (includes Subcontractors) with a crew size of more than 5 people on site. Contractors with crew sizes of 5-10 people will contribute 1 person to the clean-up crew. 11-20 people will need to contribute 2 people to the crew, 21-30 people – 3, etc.

   D. This composite clean-up crew is for general clean up on both the site and in the building and is supplemental to the daily clean up to be provided by each contractor of debris generated by their activities.

   E. The clean-up crew will be employed 8 hrs/day one day a week.

   F. The Construction Manager will provide the oversight and direction to the clean-up crew.

   G. Failure to provide the required person(s) will result in a backcharge of $100/hour per missing person.

75. COORDINATION DRAWINGS:

   A. Initiation and follow through of Coordinated Drawings shall be the responsibility of the mechanical contractor.

   B. Mechanical contractor shall develop a Coordinated Drawing Schedule. This schedule shall indicate each area and section and anticipated completion date.

   C. Construction Manager will hold weekly Coordination Meetings until the coordination effort is complete. Attendance is mandatory for all participants.

   D. Starting with the sheet metal, the drawings process will progress through HVAC piping and plumbing piping. The Mechanical contractor shall then provide copies to the electrical contractor, sprinkler contractor and contractors have support framing above the ceiling for their review and comment.

   E. The Duct Coordinated Drawings shall be utilized for the Sheet Metal and Duct Systems shop drawing and submitted for approval concurrently with coordination with other trades. Any changes or modification due to coordination shall be submitted for engineer review.

   F. Upon review by all parties and after all concerns are addressed, drawings (reproducibles) will be signed off.

   G. The mechanical contractor shall then make three (3) copies for each contractor, CM five (5) copies and Balancing Contractor two (2) copies. The mechanical contractor shall maintain the reproducibles and furnish to Construction Manager at the project completion. All field modifications shall be recorded on these drawings and utilized as
the Project Record Documents, along with cross references to the contract documents. Record Drawings shall not be used as construction drawings.

H. Any modifications to the signed off drawings will be submitted for record and signed off by all contractors.

I. Only signed off coordination drawings shall be used in the field.

J. Any contractor not adhering to this requirement shall be completely responsible for any conflicts or problems as a result.

K. All participants will establish piping elevation, main electrical feeder, light fixture, cable tray and sprinkler elevations and general locations before proceeding with coordinated drawings.

L. At the end of the project, the as built coordination drawings will be submitted both in drawing and electronic form (CADD or BIM if applicable.)

END OF SECTION
Preliminary Schedule

Time is of the essence for this work. Contractors must make all necessary provisions for labor and material delivery in order to accomplish the Substantial Completion of the new Henderson – Biobehavioral Health Building by October 30, 2012 with the start of construction in December 2010. The Abatement and Demolition Contracts will need to meet the completion dates indicated in Section A of these Bid Documents.

Within thirty (30) days after execution of the Contract each Prime Contractor shall have submitted to the Construction Manager and the General Trades Contractor a schedule outlining all phases of the work that clearly identifies sequence of work, manpower requirements, durations to complete each major work area, critical starting dates, long lead item approval/release, delivery dates and expected shift work. This schedule must be coordinated by the General Trades Contractor and with all other Prime Contractors so that at the time of submission each Prime Contractor will sign off on the schedule approving it for use in development of the overall project schedule by the General Trades Contractor. As work progresses, updated two week look-ahead schedules must be provided to coincide with the project meeting dates. In addition, a shop drawing submission schedule must be provided within ten working days showing all items requiring shop drawings and/or catalog cuts. This schedule must specify the estimated date of submission, fabrication times, the delivery dates require to maintain the Project Schedule and be tied to the master Project Schedule.

The attached “Milestone Schedule for Bidding” is a timeline and represents only the required substantial completion dates. All other activity dates will change based on development of the actual project schedule by the team of Prime Contractors who ultimately complete the bid package work for this project.

Project Overview:

This study focuses on the phasing and site logistics required to facilitate the proposed new construction currently scheduled for the Henderson complex of buildings. This proposed new construction includes Henderson Addition – Biobehavioral Health Building which will be located between Henderson North and Henderson South, and the north rim of the HUB Lawn.

The Henderson complex of buildings is situated between Old Main (to the west) and the HUB Lawn (to the east). Due to its location on campus and close proximity of the surrounding facilities it will be necessary to utilize a large portion of the HUB Lawn for staging and lay-down during construction. Because of space limitations and the adjacency of the project, it was always the intent to keep and maintain a portion of the staging and lay-down space for the duration of the project.

Henderson Addition – Biobehavioral Health Building:

This project starts the construction sequence for the Henderson Complex. This project includes the replacement of the existing Henderson Bridge building with a new 94,000 square foot state of the art academic facility. Due to the building’s central location this project also includes utility work located north of the construction site. This utility work will impact both Henderson North and Henderson South.

Prior to the commencement of the construction phase, measures will be implemented that establish access to the site throughout the construction phase. Several considerations and studies were made in order to get the site logistics for this congested area correctly designed to insure a smooth flowing construction process for not only this project but the subsequent phase.

- Safety is a major consideration on all projects. The construction area will be isolated from the rest of the campus and students through the use of a 6'-0" high chain link fence with blue, windscreen mesh around the entire perimeter of the site. To further enhance safety an additional fence running north to south from the construction staging area to the construction entrance at College Avenue and west to the entrance gate will provide an extra protective barrier to insure no conflicts between pedestrians and construction traffic. This fence will provide access provisions for all construction equipment & personnel, and will provide a physical barrier between the danger area and the rest of the campus. This will stay in place for the entire construction duration.

- Vehicle access to Henderson North will be affected by the removal and replacement of a large portion of roadway. This road work is necessary in order to expose and then extend & install new chilled water lines that service the surrounding buildings. To maintain safe use and insure accessibility during construction, traffic maintenance including flagging personnel, barricades and signage will be utilized. It is anticipated that this work will occur during the first summer (2011) of the 22 month construction schedule in order to reduce impacts on student foot traffic and deliveries.

- A temporary walk running east to west across the HUB lawn will be installed during this project outside of the construction zone to the North of the staging lay down area. This will provide the students with a path across the HUB Lawn to access other portions of the campus safely without enduring a lengthy detour. This will remain in place for the duration of the project.

- A designated student egress pathway running north to south utilizing the north east exit of Henderson East will be installed to facilitate the safe passage of students from this building during the project. To isolate students from the construction and to insure safe passage, this pathway is segregated with 6'-0" high temporary construction fence which will remain in place
throughout the project. This pathway provides safe, unrestricted passage between the Henderson East Building and the lower parking lot that will remain in use.

- The construction staging and lay-down area inside the construction fence will be utilized for the placement of job trailers from the various contractors, stockpile any soil that will be utilized for the project, a lay-down or work area for contractors to stage from, and very limited vehicle parking. This area provides adequate access to all sides of the new building for equipment and material stocking.

- One area of special consideration is the utility tunnel that runs east to west at the south portion of the construction site. The tunnel is scheduled to receive a new cast in place structural support shell to minimize loading impacts to the existing tunnel structure and will include replacement of some portions of the existing vault that are deteriorating. To protect this component from further damage, stone base covered with steel plating will be installed for the duration of construction.

- The affected area of the HUB lawn will also be protected. As a protective measure during its use as a staging area, the portion of the HUB Lawn being used (as a staging/lay down area) will have a geo-textile fabric membrane placed over the lawn surface and 8” inches of stone will be used to cover the fabric to prevent over compaction of the lawn area underneath. This will stay in place and be maintained throughout construction. Once this protective system is no longer required, it will be removed and the lawn surface repaired. The same treatment will be provided for existing trees nearby trees including protective fencing.

- Access to the site was a major consideration due to the location of the project and the surrounding facilities. Thought was given to utilize any existing elements that could minimize the impact to the area, yet provide adequate access for construction vehicles and deliveries while maintaining access to the surrounding buildings. This was accomplished by using and augmenting the existing pedestrian / bike path coming up from College Avenue. This area was widened to enhance the turning radius for large vehicles turning off of College Avenue. In addition to widening the access road, several parking spots will be purchased to increase the safe swing radius for exiting construction traffic onto College Avenue. This will provide entry to the construction site. A similar concept was used to widen an existing spur towards Henderson South that will be utilized as both a construction exit. This radius of this spur is positioned to get construction traffic back onto College Avenue in a smooth transition, minimizing sharp angled turns.

- As an additional measure of traffic control, a gate will be placed on the entrance and exit from College Avenue. Full time flagging personnel will also be present to insure both smooth flow and integration of the construction traffic onto College Avenue, and the safety of pedestrians that traverse this area on a daily basis.

- A tire wash station will be utilized to minimize debris leaving the site onto College Avenue.

- The currently proposed scheme seems to be the best choice of location, use of the surrounding areas, and minimized impact to the site; however this plan will require the relocation of several trees and an existing light pole to facilitate its implementation.

GEOTECHNICAL REPORT

Henderson Building Additions – Phase I
The Pennsylvania State University – University Park Campus
State College Borough, Centre County, Pennsylvania
March 31, 2009

INTRODUCTION

This report presents the results of a subsurface exploration and foundation analysis for Phase I of the proposed Henderson Building additions, located on the University Park campus of The Pennsylvania State University in State College Borough, Centre County, Pennsylvania.

Our services for this project were performed in accordance with CMT Proposal No. D09010, dated January 14, 2009 and revised January 21, 2009. Authorization to perform this exploration and analysis was given in the form of Penn State Purchase Order Number 335804-E, authorized by Ms. Joyce A. Haney and dated February 2, 2009.

The purpose of the test boring program was to determine the pertinent subsurface conditions and to obtain information on which to base recommendations regarding foundation design and other geotechnical aspects. The scope of services does not include an environmental assessment for the presence or absence of wetlands, hazardous, radioactive or toxic materials in the soil, surface water, groundwater, or air on, below or around the site. Any statements in this report or on the Test Boring Logs regarding odors, colors or unusual or suspicious items are strictly for the information of the client.

PROJECT AND SITE INFORMATION

The proposed Henderson Building additions are located at the existing Henderson North and South buildings on the University Park campus of The Pennsylvania State University in State College Borough, Centre County, Pennsylvania. The precise location of the proposed project is shown on a Boring Location Plan prepared by Robert Silman Associates and dated December 12, 2008.
The surface of the site, within the proposed construction footprint, contains areas that are grass covered, areas that are landscaped and areas that are covered with asphalt concrete. At the southwestern portion of the proposed building, there is an Office Link which connects Henderson South Building and Henderson North Building.

Topographic information was taken from a site plan prepared by Sweetland Engineering & Associates, Inc. In general, the site slopes gradually downward from west to east. Specifically, ground surface elevations range between approximately 1148 feet, at the southwestern end of the proposed building, to approximately 1141 feet, at the eastern corner of the proposed building.

General project information was provided by Mr. Allen H. Kachel, AIA LEED AP with Bohlin Cywinski Jackson, as well as taken from the project’s “General Requirements for Subsurface Exploration and Analysis,” prepared by Robert Silman Associates. According to this information, the proposed redevelopment of the Henderson Complex will be completed in two (2) phases. Phase I involves the complete demolition of the Office Link and replacement with a new 78,500 GSF structure, which will include one (1) below grade level and four (4) floors above grade. The basement floor elevation will be approximately 1132 feet, and the northeastern portion of the proposed building will contain an auditorium with an approximate floor elevation of 1127 feet. Specific structural information was not available at the time of this report; however, the structural system will likely consist of either concrete or steel.

Structural loading information was provided by Mr. Dipa Makim, P.E. with Robert Silman Associates. According to this information, column loads will range between 400 and 800 kips and wall loads will range between 5 and 8 kips per lineal foot. For the purpose of our analysis, we have assumed maximum floor loads of 250 pounds per square foot. In addition, we have assumed maximum tolerable total and differential settlement values of 1 inch and ½ of an inch, respectively.

The above information was utilized in our geotechnical analysis. Therefore, if any of this information has changed, is incorrect or becomes available in the future, please inform CMT so that we may amend the recommendations presented in this report, if appropriate.
GENERAL

The following recommendations are based on general subsurface information shown on the Test Boring Logs located in Appendix C. The descriptions shown on the Test Boring Logs represent the conditions only at the actual test boring locations. Variations may occur and should be expected between the test boring locations. Conditions encountered during excavation procedures may not reflect the conditions presented on the Test Boring Logs. Therefore, a representative of CMT should be present during excavation operations so that any variations may be presented to the geotechnical engineer. The geotechnical engineer may decide that the variations warrant a change to the recommendations presented in this report.

GEOLOGIC INFORMATION

According to the Department of Environmental Resources, Office of Resources Management, Bureau of Topographic and Geologic Survey (1982), bedrock formations at the proposed site are classified as the Nittany Formation (On). The bedrock within this formation is comprised of light to dark gray, finely to coarsely crystalline dolomite with alternating beds of sandy, cherty dolomite. The bedrock is moderately resistant to weathering to a shallow depth and small to medium sized flat, rectangular fragments result from weathering. The interface between the bedrock and the soil mantle is characterized by pinnacles and the development of joint channels is common. Excavation of the bedrock is difficult and cut-slope stability is good in most areas. Foundation stability is good, provided that the bedrock has been thoroughly investigated for solution openings.
FIELD INVESTIGATION

CMT notified the Pennsylvania One Call System, Inc. prior to the commencement of our field operations and Serial Number 20090570237 was assigned to this phase of the project. In addition, all field operations were coordinated with Penn State personnel. The Contractor should verify the precise location of any utilities prior to commencement of construction activities.

The field investigation consisted of six (6) test borings, at locations specified by Robert Silman Associates. Note that three (3) of the test borings were relocated slightly due to utility conflicts and site constraints. The test borings were extended to depths ranging between 21.5 and 44.0 feet below the existing surface grades and were located in the field by a representative of CMT referencing the site plan and utilizing standard location procedures. A Professional Land Surveyor was not employed for this purpose. The ground surface elevations shown on the Test Boring Logs were estimated from site plan contours. The approximate locations of the test borings are shown on the Test Boring Location Plan located in Appendix A.

The soil sampling was performed in accordance with ASTM D1586. All sampling intervals and Standard Penetration Test values were recorded and are shown on the Test Boring Logs included in Appendix C. The results of the Standard Penetration Tests indicate the relative density and comparative consistency of the soils and thereby provide a basis for estimating the relative strength and compressibility of the soil profile components.

Where auger refusal was encountered, at all test boring locations, the underlying material was cored with NQ-II wireline equipment. Auger refusal is the designation given to any material which cannot be further penetrated by the power auger and is usually indicative of boulders, lenses or the upper surface of bedrock. The recovery and RQD (Rock Quality Designation) percentages are shown on the Test Boring Logs. Analysis and interpretation of the recovery and RQD percentages provides a general description of the overall rock quality.
The stratifications shown on the Test Boring Logs represent the conditions only at the actual test boring locations. Variations should be expected throughout the site. In addition, the Test Boring Logs show the approximate boundaries between subsurface materials. Actual transitions between subsurface materials may be gradual.

**Groundwater Conditions**

A groundwater table was not encountered in the test borings at the time of field activities. Note that groundwater levels fluctuate seasonally as a function of precipitation and the permeability of the subsurface materials. There is the possibility that groundwater will have an effect on the excavation procedures during construction. We recommend that the actual groundwater conditions be determined at the time of construction.

**LABORATORY TESTING PROGRAM**

The samples obtained during the drilling operations were sealed in labeled containers and transported to our laboratory for inspection, testing and classification. Remaining samples will be retained for a minimum of one (1) year for future reference.

In addition to visual classification of the soil samples, moisture content determination tests were performed on representative split-spoon samples. The moisture content is the ratio of the weight of the water in the sample to the dry weight of the sample. These tests were performed in general compliance with ASTM D2216.

Hand penetrometer values were obtained on representative natural cohesive split-spoon samples. These values provide a basis for estimating the relative strength and compressibility of the soil.

Moisture-plasticity characteristics of two (2) soil samples were determined by means of the Atterberg Limit tests. The test determines the moisture content at which the soil begins to act as a viscous liquid (Liquid Limit - LL) and the moisture content at which the soil changes from a plastic state to a semi-solid state (Plastic Limit - PL). The
difference between the Liquid Limit and the Plastic Limit is the Plasticity Index - PI. The
test procedures were performed in compliance with ASTM D4318.

Particle-size analyses were performed on the same soil samples in compliance
with ASTM D422. The procedure includes a sieve analysis for particle sizes greater than
the #200 sieve and a hydrometer analysis for particle sizes smaller than the #200 sieve.
Using this information, the samples were classified using the Unified Soil Classification
System (USCS), ASTM D2487.

The following is a summary of the soil classification results:

<table>
<thead>
<tr>
<th>Location of Sample</th>
<th>CMT Sample Number</th>
<th>Liquid Limit (LL)</th>
<th>Plasticity Index (PI)</th>
<th>USCS Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Composite: TB-1, 5.0-8.0’ &amp; TB-3, 0.5-3.0’</td>

<td>CL</td>
</tr>
<tr>
<td>TB-1, 10.0-15.0’</td>
<td>9157</td>
<td>---</td>
<td>NP</td>
<td>ML</td>
</tr>
</tbody>
</table>

Unconfined compression tests were performed on three (3) intact rock core
specimens. These tests were performed in general compliance with ASTM D7012-04,
Method C, and a summary of these tests is provided in the following table:

<table>
<thead>
<tr>
<th>Test Boring</th>
<th>Depth (ft)</th>
<th>Total Load (lb)</th>
<th>Compressive Strength (psi)</th>
<th>Type of Fracture</th>
</tr>

A more detailed analysis of all laboratory testing results is presented in Appendix
D of this report.
SUBSURFACE CONDITIONS

Details of the subsurface conditions encountered in our field exploration are shown on the Test Boring Logs, included in Appendix C. A brief description of the materials encountered is presented in this section.

The surface of the site, at test boring locations TB-1, TB-3 and TB-6, consists of a layer of topsoil measuring between 6 and 8 inches in thickness. The topsoil contains organic matter due to the decay of vegetation and natural weathering processes and should be considered highly compressible. Due to the fact that the locations of the test borings were not intended to quantify the topsoil on the site, the topsoil depths shown on the Test Boring Logs should not be deemed adequate for cut/fill calculations.

The surface of the site, at test boring locations TB-2, TB-4 and TB-5, consists of a layer of asphalt concrete measuring approximately 8 inches in thickness. A discernable layer of gravel subbase was not encountered beneath the asphalt concrete.

The topsoil or asphalt concrete, at test boring locations TB-1, TB-2, TB-4 and TB-5, is underlain by fill materials, which consist predominantly of clay and weathered dolomite fragments with varying amounts of silt and sand. The fill material extends to depths ranging between 1.5 and 5 feet below the existing surface grades and has moisture contents ranging between 4 and 18 percent. The engineering characteristics of the fill material, such as strength and compressibility, are likely to be variable.

The above described materials, at all test boring locations, are underlain by natural residual cohesive soils. The natural residual cohesive soils consist predominantly of clay and silt sized particles with varying amounts of sand, gravel and weathered dolomite and extend to depths ranging between 8 and 15 feet below the existing surface grades. These soils have moisture contents ranging between 11 and 37 percent and exhibit a soft to stiff relative density, based upon the results of the Standard Penetration Tests and hand penetrometer values. CMT Sample Numbers 9155 and 9157 are representative of the natural residual soils.

At all test boring locations, the natural residual cohesive soils are underlain by dolomite bedrock, which was cored upon encountering auger refusal at depths ranging
between 4.5 and 21.5 feet below the existing surface grades. In general, the dolomite bedrock was in a broken to massive, slightly weathered to highly weathered and hard condition. Clay seams were present within portions of the bedrock. Rock core recovery values within the bedrock ranged between 4 and 100 percent and Rock Quality Designation (RQD) values within the bedrock ranged between 0 and 94 percent. Refer to the Test Boring Logs for further data regarding the rock core recovery and RQD percentages.

RECOMMENDATIONS

The conclusions and recommendations presented in this report are based on the data obtained from the field exploration and laboratory testing programs, information regarding the proposed construction and our knowledge of geomechanics. The subject site is considered suitable for the proposed construction, provided the geotechnical recommendations and suggested construction guidelines presented in this report are utilized in both the design and construction phases of this project.

Specific and detailed recommendations are provided in the following sections.

Sinkhole Potential

Although our test borings, which were extended into the underlying carbonate bedrock, did not reveal an active collapse or failure of the overlying materials into an existing cavity within the bedrock, the potential for sinkhole formation exists as it does for the surrounding properties. The risk for sinkhole formation is greatest during construction, when the bedrock and soil are exposed to atmospheric conditions. Every effort should be taken to prevent infiltration of runoff and precipitation into the underlying natural soils and bedrock in the vicinity of the proposed construction.
Rock Removal Considerations

Based upon the material encountered during the subsurface exploration, removal of dolomite bedrock will be required. Specifically, rock removal depths will be on the order of 8 feet for the proposed auditorium. Due the pinnacled nature of the site’s geologic formation, bedrock may be encountered at elevations higher than shown on the Test Boring Logs.

Removal of the bedrock may require special excavation techniques, such as air rotary drilling or pneumatic jack hammering, in order to facilitate removal. The method required for rock removal will depend on the weathered and intact nature of the bedrock. It is the responsibility of the contractor to determine the rock removal method, provided that method is acceptable to the owner and in compliance with any applicable ordinances and regulations.

Site Preparation

Site preparation should include the removal of all topsoil, organic matter, or any soft/wet/frozen soils, which may be highly compressible. In addition, the Office Link and all asphalt concrete should be removed. Any excavations associated with the removal of structures or subsurface utility lines should be evaluated by the geotechnical engineer or designated representative prior to backfilling.

After achieving finished subgrade in cut areas and prior to placing structural fill in areas below finished subgrade, the exposed subgrade should be evaluated to confirm that all unsuitable or unstable materials have been removed. Where practical, those areas that are at finished subgrade or those areas that are to receive structural fill should be proofrolled with an appropriately loaded, tandem-axle dump truck or similar pneumatic-tired equipment. Proofrolling will help to reveal the presence of unstable materials that were not identified during our test boring program. A representative of CMT should observe all proofrolling activities. Soft or unstable soils should be removed prior to construction activities.
If proofrolling is not feasible, the subgrade should be visually inspected and manually probed by the geotechnical engineer or designated representative. Soft or unstable soils should be removed prior to construction activities.

**Structural Fill Placement**

Structural fill is defined as all fill placed under and around foundations, floor slabs, utilities, sidewalks and pavements. Suitability of backfill material should be evaluated during construction based upon its intended use.

The on-site fill material and natural soils should not be reused as structural fill for this project. These soils can be used in areas to be landscaped.

In general, structural fill should satisfy the following criteria: Any material utilized as structural fill should not contain rock greater than 3 inches in diameter and should not contain more than 1 percent (by weight) of organic material or other deleterious material. The material should fall under one of the following Unified Soil Classifications: GW, GM, GC, SW, SM, SC, some CL (Liquid Limit less than 40) and combinations thereof. PennDOT 2B and AASHTO No. 57 stone are not considered suitable structural fill materials. Potentially expansive materials such as mine tailings, pyritic shale and slag should not be used as structural fill material. Additionally, frozen soils should not be utilized as structural fill. Other materials should be considered on a case-by-case basis. Alternate materials should be approved by the geotechnical engineer.

Poorly or uniformly graded structural fill, or structural fill exhibiting little or no cohesion may be difficult to compact in areas lacking lateral confinement. Without confinement, and when subjected to compactive effort, these soils will have a tendency to displace horizontally rather than compact.

All structural fill should be placed in horizontal lifts not exceeding 8 inches in loose thickness and within 2 percent of optimum moisture for compaction. The fill should be compacted to 100 percent of maximum dry density as determined by the Standard Proctor method (ASTM D698). Fill materials placed in non-structural or
landscaped areas should be compacted to a minimum of 95 percent of the maximum dry density.

The placement and compaction of fill should be monitored by a soils technician, working under the direction of a geotechnical engineer, to confirm that the specified degree of compaction is being obtained. The frequency of testing should be related to work conditions during earthmoving and the type and location of the fill or backfill.

**Groundwater Control**

Due to the absence of groundwater during our field exploration, it is unlikely that groundwater will be encountered during excavation operations; however, wet soil conditions may be encountered near the soil/bedrock interface. If groundwater is encountered, every effort should be made to keep the excavations dry. An open pump, gravity drainage system or other conventional dewatering procedure may be sufficient for these temporary purposes.

**Drainage**

Proper site drainage should be maintained throughout earthwork operations to minimize wet weather delays, to reduce the accumulation of moisture and to reduce the risk for sinkhole related subsidence. If the surficial soils become loosened during wet weather or frozen, these soils may need to be scarified and recompacted or removed before additional fill is placed. Also, the ground surface in the vicinity of the site should be graded so that surface water flows away from the construction.

Precautions should be taken relative to drainage in the design and construction phases. Final design plans should include measures to reduce water infiltration into the soils in order to decrease excessive erosion or soil piping into voids in the underlying carbonate bedrock, which could lead to subsurface instabilities. These measures would include providing watertight storm drains and drains that tie directly into storm drainage systems.
Foundation Recommendations

Based on the subsurface conditions encountered during our field exploration, we recommend conventional shallow foundations, consisting of continuous wall and spread/column footings, bearing on dolomite bedrock for this project. In areas where material other than dolomite bedrock is encountered at the bearing elevation, we recommend that the footings be overexcavated to dolomite bedrock and backfilled with lean concrete. Based upon the test boring data, some overexcavation will be required to remove clay and a clay/rock mixture.

Conventional continuous wall and spread/column footings bearing on dolomite bedrock and/or lean concrete can be sized for a maximum net allowable bearing capacity of 15,000 pounds per square foot. This allowable bearing pressure should include dead load plus sustained live loads. In order to provide for proper workspace, we recommend minimum footing widths of 2 and 3 feet for conventional continuous wall footings and spread/column footings, respectively. Foundation excavation and construction should be monitored continuously by a representative of CMT.

The footings should bear on sound bedrock, free of clay seams or voids at or near the bearing elevation. In addition, the bearing material should be as uniform as possible to reduce the potential for stress concentrations to occur on the footings. To ensure a uniform bearing surface, as well as to facilitate proper inspection and evaluation, all loose rock and other material must be removed from the foundation excavations. Once exposed, a representative of CMT should evaluate the bearing material to ensure that it is capable of providing the 15,000 pounds per square foot bearing capacity. Unstable areas, if encountered, will require overexcavation to sound bedrock. Any overexcavations beneath foundations should then be backfilled with lean concrete.

The rock bearing surfaces should be nearly horizontal to preclude sliding of the footings along the footing-rock interface. If foundation excavation results in sloped bearing surfaces on the order of or greater than 20 degrees from the horizontal, the geotechnical engineer should be consulted on how to proceed with the construction. Depending on the conditions encountered, possible remedies could include placing a
leveling course of lean concrete and/or providing lateral stability by embedding dowels into the bedrock.

Assuming the net loading on the footings does not exceed 15,000 pounds per square foot and the recommendations in this report are followed, total post-construction and differential settlement should both be less than the assumed tolerable values.

For protection against frost damage, all exterior foundations should be constructed at least 42 inches below final exterior grade. Concrete should be placed in the foundation as soon as practical after excavation to minimize the possibility of water and/or debris entering and collecting within the open excavations. Foundations should be suitably reinforced as per structural considerations.

**Adjacent Structure Considerations**

Special care should be taken to prevent disturbance of the bearing materials under and adjacent to the foundations of the existing buildings during foundation construction and earthwork activities. Special precautionary measures, such as underpinning, may become necessary if this is not possible. CMT should be given the opportunity to review and comment on any underpinning designs.

Also, note that vibration from construction equipment in close proximity to the existing structures may induce structural distress. We recommend that the adjacent structures be closely monitored during construction, particularly during rock removal operations.

**Slope Stability and Bracing/Shoring Considerations**

Due to the below grade depth of the proposed construction, either benching/sloping or temporary bracing/shoring will be required.

A minimum of a 1H:1V slope should be utilized for temporary (less than 24 hours) excavations; however, all slopes should be inspected for stability. Dependent
upon the composition and stability of the subsurface material encountered, benching or sloping beyond a 1H:1V slope may be required.

If benching/sloping is not feasible, temporary bracing/shoring will be required. Subsurface drainage must be considered in the design and construction of temporary bracing/shoring systems. The following table presents parameters that can be utilized in the design of temporary bracing/shoring systems:

<table>
<thead>
<tr>
<th>Material</th>

<td>N/A</td>
<td>12,000</td>
</tr>
</tbody>
</table>

Legend:  
\( \gamma_{\text{moist}} \) = Moist Unit Weight  
\( \phi \) = Undrained Angle of Internal Friction  
\( c \) = Cohesion  
\( K_a \) = Active Earth Pressure Coefficient  
\( K_p \) = Passive Earth Pressure Coefficient  
\( K_o \) = At-Rest Earth Pressure Coefficient  
\( \varepsilon_{50} \) = Strain Factor (Strain at 50% Stress)  
\( k \) = Soil-Modulus Parameter  
\( \sigma \) = Uniaxial Compressive Strength

**Lateral Earth Pressure Considerations**

We understand that the proposed construction will contain below grade walls, which will be required to resist at-rest lateral earth pressures imposed by the backfill materials.

We recommend the use of a cohesionless material, such as PennDOT 2A stone, to backfill the below grade walls. In order to prevent excessive lateral pressures during placement, the backfill should be placed in maximum vertical lifts measuring 4 inches in
loose thickness and compacted utilizing light compaction equipment. Also, in order to facilitate a proper work space, the excavations should be a minimum of 3 feet in width and at a stable slope (see “Excavations” section) from the base of the below grade walls. In areas not containing impervious pavements or sidewalks, the backfill should be capped with a 12 inch thick layer of compacted cohesive soils and sloped away from the walls. The on-site natural clay soils are considered suitable for this purpose. A Typical Below Grade Wall Backfilling Detail is presented in Appendix E.

The following parameters can be utilized in the design of below grade walls:

- Moist Unit Weight of PennDOT 2A Backfill Material ($\gamma_{2A}$): 135 lb/ft$^3$
- Angle of Internal Friction of PennDOT 2A (\(\phi\)): 38°
- At-Rest Earth Pressure Coefficient of PennDOT 2A Stone ($K_o$): 0.38
- At-Rest Earth Pressure Equation ($\sigma_o$): $\sigma_o = K_o(\gamma_{2A}H) + q K_o$ (psf)
  $H =$ height of backfill (ft)
  $q =$ surcharge pressure (psf)

**Grade Slabs**

The subgrade should be prepared according to the “Site Preparation” and “Structural Fill Placement” sections of this report. A modulus of subgrade reaction of 150 pounds per square inch/inch (psi/inch) can be utilized in the design of grade slabs. To reduce stress concentrations on the grade slab and to provide a uniform bearing surface, we recommend that a minimum of 6 inches of compacted PennDOT 2A stone be placed between grade slabs and the underlying subgrade. The stone will also act as a drainage course for any moisture below the slab.

**Seismic Considerations**

According to the 2006 International Building Code, Section 1613, Seismic Site Class C can be utilized in the design of the proposed structure.
EXCAVATIONS

The contractor is responsible for designing and constructing stable, temporary excavations and should shore, slope or bench the sides of the excavations as required to maintain stability of both the excavation sides and bottom. The contractor is responsible for following the guidelines presented in the current version of the United States Department of Labor, Occupational Safety and Health Administration (OSHA), Part 1926, Subpart P, titled “Excavations.” This information is presented solely for the information of the client, and in no way is CMT Laboratories, Inc. responsible for the construction site safety or the Contractor’s activities.

COMMENTS

This report has been prepared to assist in the design of foundations and to aid in the general site preparation for Phase I of the proposed Henderson Building Additions, located on the University Park campus of The Pennsylvania State University in State College Borough, Centre County, Pennsylvania. The recommendations presented in this report are based on the subsurface information obtained by CMT and the general project information provided by others. The importance of inspection, consultation and testing during construction cannot be overemphasized.
We request that this office be consulted if, during design or construction, conditions are encountered which differ from those contained herein, thereby warranting a review of our recommendations. This report has been prepared for the exclusive use of The Pennsylvania State University.

Respectfully Submitted,

CMT LABORATORIES, INC.

SECTION H5 – BIM REQUIREMENTS [C]

BIM REQUIREMENTS

1. Introduction

Building Information Modeling has proven to be an effective tool in increasing the efficiency of the design and construction process throughout the industry. Penn State University (PSU) and Massaro Construction Management Services LLC (MCMS) have embraced this technology and process and are committed to its use during the Henderson Bridge Phase 1 project. While there are many uses of BIM, this project will focus on 3D coordination, 4D scheduling, and record documentation. The intent of this document is to provide clarity about MCMS’ BIM process, and the requirements for participating in that process.

2. BIM-Based Trade Coordination

A. Modeling requirements for Primes

MCMS will implement a collaborative BIM process on this project for the coordination of the trades specified in Section 8 of this document. The purpose of the BIM-based coordination effort is to reach agreement on the usage of space for components installed by the different Primes, access space, and clearance space. In this coordination process, the Primes are required to provide 3D models, called Shop Drawing Models, of their scope of work. Section 8 provides the minimum requirements for the objects that need to be represented in the Shop Drawing Models of the respective Primes. The Primes are to represent all objects and space requirements in the model that are necessary to coordinate their Scope of Work with the other trades (see Section 8 for further definition of required model elements). A Prime Contractor may be appointed by MCMS to lead the BIM coordination process under the supervision of the MCMS Virtual Construction Coordinator (VCC). Each Prime Contractor's cost of participation in the BIM process as outlined in this Requirement will be included in their bid price unless otherwise explicitly approved by MCMS.

If the Prime Contractor does not have the in-house capability to produce the required Model/Models, the Prime may utilize the service of an outside entity to provide the model/models. In the event that the Prime wishes to exclude the preparation of the Model/Models from their scope of work, they must do so at bid time and must receive approval from MCMS. The Prime must still provide electronic shop drawing files as directed by MCMS to support the coordination process in (.dwg) file format. MCMS will engage a third party on behalf of the Prime in order to convert the 2D shop drawing information into (a) 3D Shop Drawing Model/Models for coordination purposes. Any and all costs associated with this work on behalf of the Prime will become the responsibility of the Prime. This does not excuse or exclude the Prime from any of the BIM-based coordination process as described in this Requirement.

B. Structuring the models

The Shop Drawing Models need to be broken down into areas/zones that correspond to the general sequence of the coordination process as directed by MCMS, and color coded per the MCMS guidelines defined in the Project BIM Execution Plan in order to provide delineation between systems. Prime Contractor's will produce a separate Shop Drawing Model (as a single file) for each specific trade, level, and/or area/zone of the building. The practice of breaking down a model by different trades, levels, and areas/zones serves multiple purposes: (1) the general sequence of the coordination process can be followed in which the team breaks up the building into different areas, coordinates these areas and signs-off on the coordination of these areas; (2) the models provided by the different project participants are distinct so no two Primes need to work on the same model or file and their contributions can be clearly delineated; and (3) the file sizes of the Shop Drawing Models remain small and manageable for all project participants. The break down structure of the Shop Drawing Models will be determined in the Project BIM Execution Plan, as defined in Section 3, will be a collaborative process involving the entire Project Team to develop the details of the BIM process.
C. **Models are a contract for installation space**

For the purpose of field installation the final, signed-off Shop Drawing Models are treated as a contract for space. By modeling their components and Scope of Work, including access space, etc., Primes reserve space. If a conflict arises in the field installation, the Prime who did not reserve space for their components has to relocate their components at their own cost or bear the cost of relocating the Prime’s components that did reserve the space. Components that are not represented in Shop Drawing Models will be installed after the components that are represented in the signed-off Shop Drawing Models.

D. **The modeling and coordination sequence**

The sequence and schedule of the coordination process is determined by the MCMS Project Manager on the project. All models and drawings will be developed in the time frames allotted and submitted so as to not delay the installation or the overall project schedule.

In general, the traditional sequence of coordination (Ductwork, Pitched Pipe, Pressure Pipe, Electrical, and Fire Protection) will be followed. Exceptions to this sequence may be necessary in certain cases. Each trade will be assigned specific work zone elevations (top and bottom) to run racks and mains. The assigned trade(s) will take precedence in their specific work zone. When a trade must impede another trade’s work zone the following items will be given precedence (additional rules may be instituted/modified at the first coordination meeting):

- Immovable objects (equipment pads, hoods, shafts)
- Graded piping routed throughout floors (waste, storm drainage, high purity)
- Items coordinated with structure (duct penetrations shown on structural)
- Items located in their designated area (piping zone, pipe rack, cable tray)
- Items that require access (VAV’s, shut off valves, fire/smoke dampers, etc.)

When practical, and unless otherwise noted in the bid packages and contract agreements, the HVAC Prime will be given priority for placing ductwork, and should publish an initial Base Ductwork Shop Drawing Model with the major trunk lines which will serve as the basis for the other trades to begin their individual models. This should happen at the beginning of the coordination process for each given area(zone), and Base Ductwork Shop Drawing Models should be provided by the HVAC Prime at least 3 weeks prior to the first coordination meeting for that particular area/zone.

E. **The model sharing, clash detection, and coordination process**

Figure 1 illustrates the BIM-Based Coordination Process.
The process starts with the designers or 3rd party modelers (who model the design documents) providing the Architectural and Structural Design Models and uploading these models to the MCMS file sharing platform. Design Models will be made available to all project participants for use as background/reference models for laying out and coordinating their Scope of Work through the creation of 3D Shop Drawing Models. Design Models provided by MCMS will only include basic architectural features such as floors, rough approximation of ceilings, chases, door openings, partitions, exterior wall surfaces, window openings, roofs, elevator shafts, and stairs, and basic structural features such as slabs and walls, steel framing – columns and beams – and major structural elements. Each Prime is ultimately responsible for coordinating to all information contained in the 2-Dimensional Contract Drawings and Specifications as related to their work. The model(s) MCMS will provide are to be used as diagrammatic representation only and not to be relied upon for their accuracy or as an accurate representation of the design, design intent, or existing conditions. The Primes are not required or encouraged to wait for the distribution of the 3D Design Models by MCMS to begin their engineering, drafting, and coordinating efforts. Each Prime will proceed with the most haste using the 2-D contract documents to begin their engineering, drafting, and coordinating in order to meet the project schedule.

MCMS will make the following material available to the Primes on a file-sharing site. All Primes will be required to sign a release for use of these materials.

<table>

</tr>
</tbody>
</table>

Following the agreed upon coordination sequence the Primes will develop the layout of their Scope of Work and upload their Shop Drawing Models to the MCMS file sharing platform 24 hours prior to the coordination meeting. In accordance with an agreed upon schedule to be defined in the Project BIM Execution Plan (usually weekly), MCMS will download the latest Models from the file sharing platform and create a Federated Model.

A Federated Model is a model that aggregates the various Design and Shop Drawing Models provided by the project participants and allows delineating these Models from each other in the aggregate representation. The software in which the Federated Model is created, Navisworks Manage, allows automated and efficient identification of the physical clashes between the Design and Shop Drawing Models. The MCMS VCC will run the clash detection discipline by discipline and create a Clash Report that describes clashes identified in the Federated Model.

This Clash Report will be made available to all project participants on the MCMS file sharing platform before each coordination meeting. The clashes identified in the Federated Model and the Clash Report will be the basis of discussion during the coordination meeting, and a strategy for resolution of clashes will be agreed upon. The Primes are required to bring their laptop computers, with relevant software installed (ie. source modeling program such as AutoCAD MEP with Quickpen, CADPipe, CADDuct, CADMech etc. as well as Navisworks Manage), such that smaller clashes can be resolved directly at the coordination meeting. For clashes that require more re-modeling work, a conceptual solution will be developed and documented in the coordination meeting and the Primes will make adjustments to their Shop Drawing Models in their home offices. The coordination process is an iterative process that requires weekly in-person coordination meetings, which will be defined in the Project BIM Execution Plan. Additional, web-based coordination meetings may be conducted with all project participants, or between individual Primes as necessary.

If conflicts or interferences in the coordination process cannot be resolved satisfactorily, the Architect/Engineer will be notified and their decision obtained.
F. Responsibilities of the Primes in the clash detection process
During the coordination process, MCMS requires the Primes to upload their models on a frequent basis as they are being developed to the provided MCMS file sharing platform. Uploads may be requested on a frequency of between once a week to daily depending on the requirements of the project, and will be outlined in the Project BIM Execution Plan. This frequent sharing of the work as it is being developed allows the Primes to make themselves familiar with the constraints of the project early and voice possible concerns before the predecessor trades finalize their work.

It is MCMS’s intention to create an environment in which clashes in the models between the trades are proactively avoided, rather than identified and resolved in the iterative process. MCMS therefore requires Primes to utilize Navisworks Manage to internally coordinate their own Shop Drawing Models and Shop Drawing Models of other trades. This shall be achieved with frequent correspondence by all involved trades, on a daily basis if necessary, to ensure that the models have been initially coordinated prior to attendance at the coordination meetings.

The purpose of the modeling and coordination process is to develop a layout that works for all trades participating in the project, not just for the trade(s) leading in the coordination process. It may therefore be necessary that portions of the model that have been developed need to be re-configured and re-coordinated to accommodate for constraints that were not obvious until a later point in time in the coordination process. This re-configuring and re-coordination is a normal part of the coordination process, and any related costs will be borne by each relevant Prime Contractor.

The BIM-Based Coordination Process does not change the fundamentals of the coordination process. MCMS will develop the Architectural and Structural Design Models (per Section 2.E. 2nd paragraph) and the Primes will create the trades Shop Drawing Models per Section 8. MCMS does not create design or shop drawing information. MCMS’s role is to facilitate an efficient coordination process and ensure the constructability of the project. Upon completion of the 3D BIM-Based Coordination Process, and only after all parties have signed off on the coordination of an area, the Primes shall derive their 2D shop drawings from their respective 3D Shop Drawing Models for submission in accordance with the Contract Documents.

G. Maintaining the Models and Drawings, Changes, and As-Builts
All Primes are required to install their components in the spaces that they reserved in the model-based coordination process so that the coordinated and signed-off model becomes the As-Built model and the coordinated drawings become the As-Built drawings.

In the event that design changes are issued by bulletin which results in changes to the model/models, it is the responsibility of the Prime to make any and all changes required for coordination of their Scope of Work and compliance with the design. If changes or adjustments become necessary, these changes or adjustments need to be represented in the respective Shop Drawing Model(s), checked for constructability in the Federated Model and coordinated with MCMS and the other Primes involved in the coordination effort. Only after MCMS’s review and approval of the updated Shop Drawing Model shall changes be implemented in the field.

A final As-Built Model will be provided by each Prime after installation of each area/zone is complete. It is the responsibility of each Prime to produce an accurate As-Built Model based on actual field conditions and installation, and to incorporate all RFI’s, change orders, bulletins etc. that have altered the Shop Drawing Model in any way. This As-Built Model shall be provided in the native file format, *.dwg file format, and *.nwd file format.

It is the Prime’s responsibility to ensure consistency between their Shop Drawing Models and drawings at any point in time. As-Built Shop Drawing Model uploads may be requested on a frequency of between once a month to daily depending on the requirements of the project, and will be defined in the Project BIM Execution Plan.
3. The BIM Setup Process

The setup process for BIM-Based Coordination will involve the lead coordinators of each of the project participants listed in Section 8 and will comprise the following activities:

- BIM Kick-Off Meeting (all participants involved)
- Development of the Project BIM Execution Plan (multiple meetings – all participants involved).
  This will be a working document throughout the life of the project, which will be updated and changed if required and mutually agreed upon, and will include the following:
  - Naming of Project participants
  - Definition of BIM goals and uses for the Project
  - Prime Contractor BIM roles, responsibilities, and staffing
  - BIM process design maps
  - BIM information exchange requirements
  - BIM and facility data requirements
  - Collaboration procedures including meetings, model delivery schedule, and interactive workspace
  - Electronic communication procedures using file sharing platform including folder structure
  - Quality control including types of QC checks and model accuracy and tolerance
  - Technological infrastructure needs including Project participant software and hardware utilized
  - Development of the coordination sequence and the coordination schedule
  - Model structure including file naming conventions, layering definition, separation of model into areas/zones, coordinate system, measurement system, origin point, and BIM/CAD standards
  - BIM project deliverables

- Setup of the file sharing platform (done by MCMS)
- Proof of concept of the interoperability of the different modeling systems used on the project (all participants involved)
- Proof of concept of the functionality of the MCMS file sharing platform (all participants involved)
- Development of file format exchange protocols and installation of Object Enablers (all participants involved)
- Navisworks Manage training for model review and clash detection (participants as necessary – Primes responsible to get software training from vendors as necessary)

Typically, it takes 3 weeks after the BIM Kick-Off Meeting until the systems of the Project participants are setup in a way so that they can efficiently exchange files.

4. Modeling, Model File, and Drawing File Requirements

The Primes will provide their files in a file format that is useful for the coordination team for spatial coordination. The minimum requirements for the Shop Drawing Model files are the following:

- All files will be AutoCAD *.dwg file format with components of the Prime’s scope represented as 3D solids or 3D surface models (not line or wire frame models). In addition all *.dwg files shall be saved down to the lowest common AutoCAD version which will be defined in the Project BIM Execution Plan. The use of formats and versions other than *.dwg needs to be coordinated with MCMS’s VCC.

- All files will be readable by other trades’ CAD systems and Navisworks. Being ‘readable’ means the ability to open a file without any errors (such as prox, xref resolution, geometry errors, etc.) and with objects, layers, and other file properties remaining intact.

- The coordinate system and x,y,z origin point for all Model(s) will be determined in the Project BIM Execution Plan, and will be adhered to at all times by all Primes. As a default the coordinate system of the Structural Design Model will govern. A typical origin would be the center of the field (X,Y) as indicated on drawing A1-0 Work Point #1, with (Z) elevation at 0’ above mean sea level, which should match building elevation at 0’.

- All 3D model files and 2D drawing files (i.e. for coordinated composite drawings, shop drawings and installation drawings) will use the same coordinate system and origin point. 3D Shop Drawing
Model files and 2D Shop Drawing files should be one and the same file, with the annotation layers turned off in the 3D model file representation.

- Model coordination files will be saved to the MCMS file sharing platform for access by all Primes, MCMS, and the owner’s representative. The folder structure, which will be defined in the Project BIM Execution Plan, will always contain a “Latest Model” file. It will be the Trade Contractor’s responsibility to maintain the latest models in the correct file folder at all times.
- The layering standards of the submitted model files shall follow AIA layering standards, and will be defined in the Project BIM Execution Plan.
- Access spaces and clearance spaces represented in the model need to be represented on a layer named CLEARANCE.
- Annotations must be on layers separate from layers containing 3D geometrical information and have to be designated as annotation layers.
- The breakdown structure of the Models and the names of the corresponding files will be determined in the Project BIM Execution Plan.
- The building elements represented in the Models need to be of a granularity that corresponds to the anticipated method of installation – for both 3D coordination purposes and so that the model can be linked to a schedule for 4D simulation of the construction process.
- Model file names will comply with the naming structure as defined in the Project BIM Execution Plan. An example would be:
  - “FPXXX27L2.dwg” where “FP” designates the trade, “XXX” is the three letter abbreviation for the Prime (assigned by MCMS), “27” indicates the Area/Zone location, and “L2” indicates the level number.

5. Hardware and Software Requirements

Requirements for coordinators:
- Each coordinator’s / detailer’s computer will be loaded with the relevant modeling software and latest version of Navisworks Manage.
- Each coordinator’s / detailer’s computer will have hardware of sufficient capacity to handle any Model file being produced for the Project.
- Each lead coordinator will have a laptop that meets the above requirements.
- Each coordinator will have a functional email address.
- Each coordinator will have an internet connection from both the home and field office that allows general internet access, access to collaboration tools (ie. GoToMeeting) and access to the MCMS file sharing platform.

6. BIM Training and Support

Throughout the project duration MCMS’s designated VCC will be the direct point of contact for all Primes for BIM related questions. The VCC will establish the protocols for efficient file sharing and hold training/information sessions for items related to the Project BIM Execution Plan like using the MCMS file sharing platform.

7. Sign-Off and Coordination Drawing Requirements

Final 2D coordination drawings generated from the fully coordinated and approved 3D Shop Drawing Models will still be required as record documents. For the Project it is the HVAC Prime’s responsibility to assemble the 2D coordinated composite drawings for sign-off. Each Prime/trade listed in Section 8 shall provide the HVAC Prime with the Shop Drawing files in dwg-format so that he/she can assemble the coordinated composite drawings. The HVAC Prime is then required to compile and plot the number of color copies of the 2D, multi-trade, coordinated drawings required by the contract documents for final review and approval by the design team or as indicated in the Contract Documents. This is required for each floor as well as each riser. These 2D files will be the same as the 3D Shop Drawing Model files used for the BIM-based coordination process, with the annotation layers turned on.
8. Minimum Requirements for Components Represented in Models and Drawings

The requirements for objects to be included in the Shop Drawing Models provided by the Primes are minimum requirements. In case of contradictions in the scope descriptions below, the case that imposes the greater duty on the Prime shall govern.

A. General Requirements

- The Primes will provide all objects in their models that are necessary for the coordination between the trades.
- All elements must be drawn to scale and shall be a true/accurate representation of what is to be installed in the field in all three dimensions, with real-world sizes and coordinates.
- All elements must have identifiable designations including material type, part designation, size, manufacturer, and model number. In addition to these designations, all equipment shall also have serial number designations.
- Each Prime is responsible for protecting access zones within their Models. Access zones should be modeled in 3D at 80% transparency so as not to obscure the main fixture or element being protected.

B. MCMS Architectural and Structural Design Models

- Basic architectural features such as floors, rough approximation of ceilings, chases, door openings, partitions, exterior wall surfaces, window openings, roofs, elevator shafts, and stairs
- Basic structural features such as slabs and walls, steel framing – columns and beams – and major structural elements

C. General Trades Prime Structural Shop Drawing Models

- (deleted text) [C]
- All structural steel will be modeled and will represent an "as fabricated" fully detailed level of information. The fabrication level detailed model will include, but is not limited to, major structural members such as trusses, beams, columns, etc, as well as secondary and miscellaneous steel connections including gusset plates, bracing, angles, knife plates, etc necessary for the successful coordination of other building trades.

D. HVAC Prime Shop Drawing Models

- HVAC Sheetmetal
  - All ducts, related accessories (including but not limited to standard dampers, fire dampers, VAV boxes, diffusers, return air ducts, turning vanes, flanges, connections etc.) and HVAC equipment will be modeled.
  - Ducts will be modeled to the outside face dimension including duct insulation.
  - Hangers will be modeled unless their installation will not impact the coordination of any other trades.
  - All structural supports including strongback angles and unistrut supports will be modeled at full scale.
  - Access zones will be modeled for all elements requiring access including but not limited to equipment, fixtures, standard dampers, fire dampers, VAV boxes, diffusers, turning vanes, fan coil units etc.
  - All equipment will be modeled to its accurate height, width and depth dimensions.
  - Equipment pads with accurate dimensions will also be modeled.
  - All access panels will be modeled, including access zones above and below.
  - In the event that seismic bracing for suspended elements is required by code, such bracing will be included in the model.

- HVAC Piping
  - All piping, related accessories (valves, valve chains, air vents, drain valves, flow meters, etc.) and HVAC equipment will be modeled.
  - Pipes will be modeled to the outside diameter of the pipe including pipe insulation.
o Hangers will be modeled unless their installation will not impact the coordination of any other trades. All spring hangers will be modeled including anchoring devices, regardless of whether they impact other trades.

o Equipment will be modeled to its accurate height, width and depth dimensions. Equipment pads with accurate dimensions will also be modeled.

o Access zones will be modeled for all elements requiring access including but not limited to equipment, fixtures and valves.

o All access panels will be modeled, including access zones above and below.

o In the event that seismic bracing for suspended elements is required by code, such bracing will be included in the model.

o Trays for the protection of electrical equipment, if allowed by code, will be modeled.

E. Plumbing Prime Shop Drawing Models

- All plumbing, specialty piping, medical gas systems, gas systems, fittings, related accessories (valves, cleanouts, air vents, drain valves, flow meters etc.) and equipment will be modeled. Plumbing fixtures will be modeled as part of the architectural model.

- Pipes will be modeled to the outside diameter of the pipe including the pipe insulation. Pipe slope will be incorporated in the model.

- Hangers will be modeled unless their installation will not impact the coordination of any other trades.

- Equipment will be modeled to its accurate height, width and depth. Equipment pads with accurate dimensions will also be modeled.

- Access zones will be modeled for all elements requiring access including but not limited to equipment, fixtures, valves and cleanouts.

- All access panels will be modeled, including access zones above and below.

- In the event that seismic bracing for suspended elements is required by code, such bracing will be included in the model.

- Trays for the protection of electrical equipment, if allowed by code, will be modeled.

F. Electrical and Telecommunications Primes’ Shop Drawing Models

- All conduit 1” and larger (including racks of two or more conduits regardless of size), power feeds to equipment, switch gear, transformers, panels, distribution boxes, junction boxes, cable trays and pull station locations will be modeled.

- Hangers will be modeled unless their installation will not impact the coordination of any other trades.

- Light fixtures with accurate height, width, and depth dimensions and space requirements to be included in the model and coordinated with reflected ceiling plan. All access zones or clearances to maintain light fixtures will also be modeled.

- Access zones for equipment, cable tray, electrical panels, j-boxes to be included in the model.

- Equipment will be modeled to its accurate height, width and depth. Equipment pads with accurate dimensions will also be modeled.

- Equipment and junction box access zones per specification and code (which ever is greater) will be modeled. Specialty systems (gen. sets, UPS, ATS, etc.) will be modeled.

- All access panels will be modeled, including access zones above and below.

- In the event that seismic bracing for suspended elements is required by code, such bracing will be included in the model.

- All structural supports and racks utilizing unistrut, angle iron, etc. will be modeled.

- Hangers will be modeled unless their installation will not impact the coordination of any other trades.

G. Fire Protection Prime Shop Drawing Models

- All components of the fire protection system will be modeled including risers, mains, and branch piping, valves, fittings, drains, test connections, sprinkler heads, fire pumps, tanks etc.

- Access zones will be modeled for all elements requiring access including but not limited to equipment, fixtures, valves and controllers.
• Locate all piping, valves, fire pumps, and sprinkler heads.
• Equipment will be modeled to its accurate height, width and depth. Equipment pads with accurate dimensions will also be modeled.
• All access panels will be modeled, including access zones above and below.
• In the event that seismic bracing for suspended elements is required by code, such bracing will be included in the model.
• Hangers will be modeled unless their installation will not impact the coordination of any other trades.
• Trays for the protection of electrical equipment, if allowed by code, will be modeled.

9. Contract Documents and Legal Aspects

A. Any model(s) provided by the design team or MCMS (whether internally created or created by 3rd party modelers), which are subsequently provided to the Primes, are not Contract Documents as that term is defined herein. In all cases, it is the Prime's responsibility to determine if the model(s) agrees with the Contract Documents. Primes must, within fourteen (14) days of receipt of the later of any Model(s) and the corresponding Contract Documents, report all discrepancies and inconsistencies to MCMS between the Model(s) and the Contract Documents. Immediately thereafter, MCMS requires coordination of the systems listed under Section 8 herein, at the Prime's sole cost and expense, including the necessary addition of any information required for coordination from the Contract Documents in the Model(s) provided.

B. The requirement to provide coordinated and signed off drawings as outlined in the Contract Documents remains unaffected by the requirements and provisions described herein.

C. To the extent the Prime must modify or add to the Model(s) provided, the Prime grants an exclusive copyright license for the newly created and/or modified Model and model components, including the right to sell the model(s) or parts of it for any purpose whatsoever. MCMS does not waive any of its intellectual property rights and shall have the sole and exclusive right to use the BIM and all submissions made by Prime as it deems appropriate, whether during or after construction.

D. Prime agrees to use those model(s) created by/through MCMS, and their own modifications of those model(s), at their own risk and without liability to MCMS, its employees, its consultants, and their employees. Prime acknowledges and agrees that MCMS shall incur no responsibility or liability with respect to the BIM or the use thereof, including that resulting from errors, omissions or deficiencies in the BIM.

E. In the event that the Prime provides deficient information or data that does not represent the Work it will be ultimately providing, that is corrupted, that contains a virus and/or that otherwise damages the BIM, the Prime shall bear all costs associated with reconstructing the BIM and to otherwise remediate such deficiencies or their effects, and Prime shall correct the deficiency within 1 week of its discovery.

F. Prime Contractor also agrees that neither the BIM nor the use of the BIM is in lieu of nor intended to relieve the Prime of its responsibilities under the Contract, including to (i) coordinate its Work with the work of others involved in the Project and (ii) strictly comply with the other requirements of the Contract Agreement and the Contract Documents.

G. It is expressly understood that no party shall be liable to the other for any claim, dispute, controversy, cost or expense arising solely out of the use of the BIM.

Table of Contents

I. General Requirements 3
   Regulations and Guidelines 3
   Definitions 3
   Submittals and Notifications (Pre-Bid to Post-Job) 5
   Personal Protection and Decontamination 9

II. Materials and Equipment 11

III. Execution of Work 11
   Preparation and Set-up 11
      Preparation for Glovebag Removal of Pipe Insulation 15
      Preparation for Transite Removal (Indoor) 16
      Preparation for Floor Tile and Mastic Removal 16
   Asbestos Removal 17
      Glovebag Removal of Pipe Insulation 17
      Gross Asbestos Removal 17
      Asbestos Containing Built-up Roofing Removal 19
      Transite Roofing and Siding Removal 20
   Final Cleanup of Containment/Work Areas 21

IV. Air Monitoring and Inspection Firm Qualifications and Requirements 22

Appendix A Asbestos Removal Scope of Work
Appendix B Unit Price Quotation Sheet
Appendix C Work Phasing / Schedule / Manpower / Working Hours
Appendix D Approved Asbestos Contractors and Site Visit Requirements
Appendix E Approved Air Monitoring and Inspection Firms
I. **General Requirements**

A. This specification covers the removal and disposal of Transite sheeting and ducting, spray or trowel-applied materials, ceiling tiles, thermal pipe insulations, boiler breaching or any other material that has been determined, by the University, to contain asbestos.

B. The Contractor shall furnish all labor, materials, services, insurances and equipment necessary to carry out the removal and disposal operations.

**NOTE:** Asbestos contractors must be on the Penn State Office of Physical Plant's Prequalified Bidders List prior to bidding.

C. The current issue of each of the following documents shall govern. Where conflicts between these specifications and the following regulations exist, the more stringent shall apply.

1. **Regulations.** Contractor(s) shall comply with the most recent, applicable Federal, State and Local regulations.

   Title 29, Code of Federal Regulations, Section 1910.1001, Occupational Safety and Health Administration (OSHA), U.S. Department of Labor.

   Title 29, Code of Federal Regulations, Section 1926.1101, Occupational Safety and Health Administration (OSHA), U.S. Department of Labor.

   Title 25, Part I, Subpart C, Article III, Chapters 123, 133, 137, Pennsylvania Department of Environmental Protection (DEP).

   Clean Water Act - U.S. Environmental Protection Agency.

   Federal and Pennsylvania Departments of Transportation.

D. **Definitions**

   **HEPA Filtered Vacuum** - High Efficiency Particulate Air (HEPA) filtered vacuum equipment capable of collecting and retaining asbestos fibers, at a minimum efficiency of 99.97% for fibers 0.3 microns or larger.
**Surfactant** - a chemical wetting agent added to water to improve penetration into asbestos containing materials.

**Critical Seal or Critical Barrier** - a barrier, consisting of two layers of 6-mil plastic sheeting sealed with tape and/or spray glue, used to prevent air entry or escape into or from the work area for the duration of the project. Critical seals shall be used to cover items such as doorways, windows, electrical fixtures, heating and ventilation louvers, immovable objects or any other object deemed necessary by the University.

**Airlock** - a system permitting passage to and from an asbestos work area preventing air movement from a contaminated area to an uncontaminated area, consisting of curtained doorways at least (3) feet apart.

**Curtained doorway** - a device to allow passage from one room to another while permitting minimal air movement between the rooms, constructed in one of the two manners:

1. Two or three overlapping sheets of 6-mil plastic over an existing or temporarily framed doorway; securing each along the top and one vertical edge of each sheet. Each sheet shall be secured along the opposite vertical side of the other.

2. Three overlapping sheets of plastic the outermost sheet attached on the top; the middle sheet attached on all sides with a vertical slit cut vertically down the center; and the innermost sheet attached on top and weighted on the bottom to fall against the middle sheet in the event of a loss of negative pressure.

The Contractor may select either of the above options; however, the Contractor must demonstrate to the satisfaction of Environmental Health and Safety that adequate directional air flow is provided with the option selected.

**Worker Decontamination Enclosure System** - a series of connected rooms, with curtained doorways to adjacent rooms, consisting of a clean room, a shower room and an equipment room. The system shall be constructed with two layers of 6-mil plastic and shall be watertight. Tape and/or glue seams shall NOT be placed on the bottom of the system.

**Equipment Decontamination Enclosure System** - a series of connected rooms with curtained doorways between adjacent rooms, consisting of a designated area in the work area, a washroom, a holding area and an uncontaminated area. The system shall be constructed with two layers of 6-mil plastic and shall be watertight. Tape and/or glue seams shall NOT be placed on the bottom of the system.

**Clean Room** - an uncontaminated area or room within worker decontamination enclosure system; with provisions, when possible, for the storage of workers clothing and protective equipment.

**Shower Room** - a room between the clean room and the equipment room in the worker decontamination enclosure system. The shower room shall have supplies such as soap and shampoo for proper employee decontamination when exiting the work area.

**Equipment Room** - a contaminated area or room in the worker decontamination enclosure system, with provisions for storage of contaminated clothing and equipment.

**Washroom** - a room between the work area and the holding area in the equipment
decontamination enclosure system. The washroom shall have provisions (water, rags, clean disposal bags) to decontaminate waste, equipment, etc., as it exits the work area.

Environmental Health and Safety (EHS) - 6 Eisenhower Parking Deck, The Pennsylvania State University, University Park, PA 16802. Phone: (814) 865-6391, Fax: (814) 863-7427.

Office of Physical Plant (OPP) – Physical Plant Building, The Pennsylvania State University, University Park, PA 16802. Phone: Contact the Project Manager or Coordinator for the project.

Penetrating Encapsulant - liquid sealant designed to be applied to materials to penetrate the material, bind its components together, and prevent fiber release. The encapsulant shall be approved by the University prior to use.

Bridging Encapsulant - a sealant material which surrounds or embeds asbestos fibers in an adhesive matrix, creates a membrane over the surface and prevents fiber release. This encapsulant shall be approved by the University prior to use.

Work Area - a room, a section of a room or other designated space in which asbestos abatement is being conducted or as defined by Environmental Health and Safety.

Work Plan – a written plan prepared by the contractor which details the scope-of-work as understood by the contractor, proposed containment and worker decontamination enclosure unit design, work phasing, scheduling, etc.

Ladders and Scaffolding - metal and wooden ladders shall be prohibited in the work area during asbestos abatement. Wooden planked scaffolding will also be prohibited.

Airless Sprayer - an electrical or hand pressurized liquid spray applicator used to apply amended water and encapsulant. Airless sprayers shall NOT be used for “Power Washing” or “Power Stripping” asbestos containing materials from the work area.

E. Submittals and Notifications

1. Contractor Information To Be Submitted With Bid Proposal

   NOTE: Asbestos contractors must be on the Penn State Office of Physical Plant’s Prequalified Bidders List prior to bidding.

a. Documentation, to Environmental Health and Safety, that all employees and supervisors conducting asbestos abatement activities have attended a PA and EPA accredited Asbestos Worker or Supervisor Training program; valid proof of which (photo ID or documentation issued by PA Department of Labor and Industry) must be presented before anyone will be allowed to work on any asbestos removal activities

   Note: For removal projects that entail only non-friable, tar-based roofing and caulking from the exterior areas of buildings, an OSHA/EPA “Competent Person” can be substituted for a PA licensed “Supervisor” (i.e. Asbestos Supervisor License from other accredited state programs).
b. Documentation, to Environmental Health and Safety, that the Contractor is licensed by the PA Department of Labor and Industry (except for removal projects that entail only non-friable, tar-based roofing and caulking from the exterior areas of buildings); and Allegheny and Philadelphia Counties (if needed).

c. The Contractor may select the disposal site for the asbestos waste material. However, this site shall be approved by Environmental Health and Safety and the appropriate state authority. The Contractor shall submit, to Environmental Health and Safety, written verification from the regulating state agency in which the landfill is located stating their approval of this site; as well as, site location, license number, telephone number, etc.

d. The Contractor may choose to use a contracted asbestos waste hauler. However, the hauler shall be approved by Environmental Health and Safety and the appropriate state authority. The Contractor shall submit, to Environmental Health and Safety, written verification from the regulating state agency in which the hauler is located stating their approval of the hauler; as well as, office location, hauler license number, telephone number, etc.

e. The Contractor shall provide a copy of all applicable insurance certificates (including asbestos removal liability insurance, if needed) and Worker’s Compensation to Environmental Health and Safety.

f. The Contractor shall provide written verification when applicable, to Environmental Health and Safety, that all workers who will work in “contaminated” or “regulated” areas participate in a medical surveillance program as required in 29 CFR 1926.1101, OSHA Asbestos Standard for the Construction Industry.

g. The Contractor shall provide the resume’ of a foreman or superintendent(s) who will act in this capacity for the duration of the project. The foreman or superintendent(s) shall have at least one year's experience in this capacity. The Contractor shall show that this person is certified in PA for supervising asbestos abatement projects. This person must be employed by the contractor and be on the project site during all project activities.

Note: For removal projects that entail only non-friable, tar-based roofing and caulking from the exterior areas of buildings, an OSHA/EPA “Competent Person” can be substituted for a PA licensed “Supervisor” (i.e. Asbestos Supervisor License from other accredited state programs).

The University reserves the right to review and approve or reject this foreman or superintendent.

h. Submit a notarized statement describing all citations and/or violations issued by any regulatory agency or consultant concerning performance on previous abatement contracts. Briefly describe the circumstances, citing job, involved persons and agencies.

The term "violation" includes all activities which have resulted in issuance
of a Notice of Violation, administrative order, civil penalty, other monetary settlement (settlement agreement, settlement letter, letter agreement, or consent assessment), permit or license suspension or revocation, bond forfeiture, summary misdemeanor or felony conviction, pleas of guilty or no contest, or any consent agreement, consent order, consent adjunction, consent or settlement decree, or any court actions whether pending or settled.

Provide a written discussion of the outcome of any citations or violations, answer the question, "has your firm or its agents been issued a Stop Work Order on any project due to negligence within the last twenty-four months?" If "Yes," provide details as discussed above.

Answer the question: "are you now, or have been in the past, a party to any litigation or arbitration arising out of your performance on asbestos abatement contracts?" If "Yes" provide details as discussed above.

Describe any liquidated damages assessed within the last twenty-four months.

Failure to properly or truthfully report any of the required information in this section shall be considered grounds for rejection of bids or termination of contract, and removal from the University's approved bidders list.

2. Information To Be Submitted By Contractor Prior To Commencement Of Work

a. Notify the EPA Region III office (NESHAPS Coordinator), the PA DEP Harrisburg office and the PA Department of Labor and Industry, in writing, of the proposed asbestos abatement before any work commences (Typically 10 working days for EPA and PA DEP, depending on the scope-of-work, and 5 calendar days for PA Department of Labor and Industry.).

A FAX and hardcopy are to be submitted to PSU Environmental Health and Safety. (FAX copy on the same day the notification is mailed. Hard copy with the project final report or documentation.).

A FAX copy is also to be submitted to the local PA DEP office in the area where the project is to be conducted and the project air monitoring and inspection firm. This shall also be faxed the same day the notification is mailed.

Proof of Mailing: The contractor shall provide “proof of mailing” these required notifications to EHS when submitting the FAX copy. This can be in the form of a registered letter receipt, copy of the postmarked envelope, etc. A copy of an envelope with a postage stamp is not acceptable.

Emergency notifications and/or project notifications less than 5 or 10 working days shall be scheduled and/or approved by Environmental Health and Safety only. These notifications, after approval from Environmental Health and Safety, shall be FAXed to all aforementioned regulatory agencies and Environmental Health and Safety, followed by
Notifications to Allegheny and Philadelphia Counties shall be in accordance to that county’s respective regulations.

Additions, deletions or corrections to notifications shall be the responsibility of the contractor or Environmental Health and Safety, depending on the circumstances.

b. Submit to Environmental Health and Safety any required PA Department of Labor and Industry notifications when removing non-friable roofing and caulks from the exterior of buildings. This shall be FAXed to Environmental Health and Safety, followed by hard copy.

c. Submit to Environmental Health and Safety any required Allegheny or Philadelphia County Project Permit if the work is to be conducted in either county. This shall be FAXed to Environmental Health and Safety, followed by hard copy.

d. When requested, submit to Environmental Health and Safety a Work Plan which details the scope-of-work as understood by the contractor, proposed containment and worker decontamination enclosure unit design, difficult conditions, work phasing, scheduling, etc. The need for a work plan will be determined by Environmental Health and Safety on a case-by-case basis.

e. The contractor shall submit a notarized statement verifying that any vehicle used to haul asbestos waste or equipment shall not be used for hauling any other material, such as, but not limited to produce and other consumer products. The notarized statement shall also confirm that this vehicle will not be a rental vehicle.

3. Documentation and Signage Required During and After Abatement Project

a. The contractor shall provide Environmental Health and Safety, a Waste Shipment Record (WSR) or manifest for all types of asbestos waste. This shall be in a format similar to that shown in EPA NESHAPS regulations and show the total number of asbestos disposal bags, drums, tons, etc. transported from the University to the approved disposal site or contractor temporary storage area or warehouse. This shall be provided to EHS when the waste leaves Penn State property.

Then, again when applicable, the contractor shall provide Environmental Health and Safety the same WSR showing that the asbestos waste was properly transported and delivered to the approved disposal site. This shall be accompanied by a written receipt from an authorized agent of the disposal site reflecting the actual number of bags, drums, etc. received for disposal.

The WSR and receipt shall be submitted to Environmental Health and Safety no later than 45 calendar days from pick-up by the initial transporter.
b. Non-friable, built-up roofing and caulking debris is not considered “asbestos waste” and, therefore, does not need to be segregated from general roofing/construction waste.

c. Signs and barriers as required by EPA and OSHA standards shall be provided and displayed at each location where asbestos abatement is conducted. Signs shall be posted at the perimeter of the work area(s), the entry and exit, and at any barriers separating work areas from occupied areas. The aforementioned signs shall also be placed on any “asbestos waste” disposal or storage vehicles during loading and unloading of asbestos waste. Depending on the waste, transport vehicles may also need to be posted with "Municipal" or "Residual Waste" signs and "UN Class 9" placards as required by PA DEP Municipal or Residual Waste and DOT Regulations.

d. The Contractor shall, upon request, provide the results of all personal exposure monitoring air sample results to Environmental Health and Safety.

e. When working in “containment areas”, the Contractor shall maintain project worker and visitor’s logs signed by all workers and visitors, including the building owner, Architect, Engineer, or representative of private or governmental inspectors, and Contractor representatives. The logs will also note reason for entry, date and duration of time in the work area, activities in the work area, safety precautions used, protective equipment used, etc.

This Log shall be provided to Environmental Health and Safety within ten days after completion of the project.

Payment for services will not be released until all required pre and post-project original documentation, invoices, etc. are received and approved by Environmental Health and Safety. Additional copies are not to be sent to other areas departments within the University. Partial payments shall be made as needed or negotiated for larger, long term projects.

F. Personnel Protection and Decontamination

1. The contractor shall provide workers with sufficient sets of protective equipment. This shall consist of full body coveralls (including attached hood and booties), headgear, eye protection and respiratory protection, gloves, etc. Nondisposable protective clothing, footwear, and eye protection shall be left in the equipment room until the end of the project, at which time such items shall be disposed of as asbestos waste, or shall be thoroughly cleaned of all visible dirt and debris. Used disposable protective clothing shall be disposed of as asbestos containing waste.

2. Respiratory protection should consist of a minimum of Powered Air Purifying Respirators (PAPR's) for gross removal and half mask Air Purifying Respirators (APR's) for preparations, repairs, glove bag removal and final cleaning. PAPR's are suggested for all activities.
3. The contractor shall provide University Officials with approved respirators and other protective clothing as described above whenever they enter the work area. Respirators worn by officials shall be equipped with new filters or cartridges whenever they enter the work area.

The Contractor shall provide at each work area a clean and disinfected PAPR for use by authorized visitors who have not undergone approved qualitative or quantitative respirator fit testing.

4. Worker Protection Procedures:
   a. Each worker shall, upon entering the decontamination system or work area: remove street clothes in the clean room, put on a respirator and clean protective clothing, before entering the shower, equipment room or the work area.
   b. Each worker shall, upon leaving the work area: remove gross contamination from clothing, etc. before leaving the work area; proceed to the equipment room and remove all clothing except respirator; still wearing the respirator, proceed naked to the shower, clean the face, head and outside of the respirator with soap and water; remove respirator dispose of filters as asbestos waste (If filters are to be re-used, they must be sealed at the intakes.). Following showering and drying, each worker shall proceed directly to the clean room and dress in street clothes.
   c. Contaminated footwear shall be stored in the equipment room when not in use in the work area. Upon completion of asbestos abatement, dispose of footwear as contaminated waste or clean thoroughly inside and out using soap and water.

   Store contaminated protective clothing in the equipment room for re-use or place in receptacles for disposal with other asbestos contaminated materials.
   d. Workers shall not eat, drink, or chew tobacco in the work area, except in the established clean room, after proper decontamination.

   SMOKING IS PROHIBITED IN ALL UNIVERSITY FACILITIES.
   e. Workers shall be fully protected with respirators and protective clothing immediately prior to the first disturbance of asbestos-containing materials and until "Final Air" testing is completed and acceptable. Precautions may be required during preparations, depending on the condition of the material to be abated.
   f. Authorized visitors shall enter the work area wearing an approved respirator, coveralls (two sets), headcover and footwear. Each time they leave the work area, they shall remove gross contamination from clothing before leaving the work area and remove the first coverall, not the respirator, in the equipment room. Respirators and the second coverall shall be removed in the clean room.
Visitors who have not undergone approved quantitative or qualitative respirator fit testing shall wear a PAPR when entering the work area.

G. Equipment Removal and Decontamination Procedures

1. Clean contaminated containers and equipment thoroughly by wet wiping and/or using a HEPA-filtered vacuum before moving into the washroom for final cleaning and removal to uncontaminated areas.

II. Materials and Equipment

A. Materials

1. Plastic Sheeting shall be of 6-mil minimum thickness.

2. Tape shall be capable of sealing joints of adjacent sheets of plastic sheeting to finished or unfinished surfaces of dissimilar materials and capable of adhering under dry, wet, hot or cold conditions, including use of amended water.

3. Surfactant (wetting agent) shall be mixed with water in a concentration sufficient to enhance the penetration of water into the materials to be removed.

4. Impermeable asbestos disposal containers shall consist of two, 6-mil plastic bags; if needed, capable of fitting in or lining drums which are capable of being sealed (metal or fiber drums) with tightly fitting lids.

The containers (bags or drums) shall be labeled in accordance with OSHA Standard 29 CFR 1910.1001 and 1926.58, as well as, EPA NESHAPS, and DOT regulations.

5. Glovebags shall be a minimum of 6-mil thickness with attached gloves, tool pouch, proper labeling, etc.

Modification of glovebags shall be prohibited unless specified by Environmental Health and Safety.

III. Execution of Work

A. Preparation and Set-up

1. Work Area:

   a. The contractor shall isolate heating, cooling and ventilating air systems with critical seals to prevent contamination to other areas. Critical seals shall remain in place for the duration of the work, and until the "Final Air" samples are approved by Environmental Health and Safety or it's representative.

   Any portion of an operating ventilation system which distributes air into any part of a building, including but not limited to duct work, shall be isolated so as not to be part of the containment area unless approval is
b. The contractor shall seal all openings, including but not limited to corridors, windows, doorways, sky-lights, ducts, grills, diffusers, pipe chases, electrical outlets, non-removable light fixtures and any other penetrations of the work areas, with critical seals, as directed by Environmental Health and Safety or its representative.

Doorways and corridors which will not be used for passage during work must be sealed with barriers as described below. These openings shall be sealed prior to any disturbance of asbestos-containing materials (e.g. prior to the removal of ceiling fixtures, tiles, etc.).

c. Separation of Work Areas from Occupied Areas

The contractor shall separate parts of the building required to remain in use from parts of the building that will undergo asbestos removal by means of airtight barriers, constructed as follows:

(a) Build suitable wood or metal framing and apply 12 mil minimum thickness plastic sheeting on both sides.

Black plastic may be required by EH&S or its representative.

(b) Seal the plastic sheeting with tape as specified on the work area side.

d. Pre-cleaning

In the event of prior asbestos contamination, Environmental Health and Safety or its representative may require pre-cleaning of the area(s) to be covered with critical seals or barriers. HEPA filtered negative air machine installation, personal protective equipment use and curtained doorway installation over the entrance(s) to the work area may also be requested prior to precleaning.

The contractor shall preclean all objects within the work area. This will be conducted using HEPA-filtered vacuums and/or wet cleaning methods. Removable objects shall be moved from the work area to a designated location only after they are precleaned.

e. The contractor shall cover floor and wall surfaces with a minimum of two layers of 6-mil plastic on both floors and walls, sealed with tape (and glue if needed).

The first layer of floor plastic shall extend at least 12 inches up on walls, then cover walls with one layer of plastic sheeting to the floor level, thus overlapping the floor plastic by a minimum of 12 inches. Install the second layers of plastic in the same manner as the first layer, thus causing an overlapping to prevent water leakage. The first and second layers shall be installed so as to allow them to be separated or removed.
independently of each other.

The floor plastic shall be installed without seams whenever possible.

f. The contractor shall install a HEPA filtered negative air pressure system(s) at all work areas to ensure a minimum negative pressure differential of 0.02 inches of water column relative to all adjacent areas. The direction of air movement shall be towards the work area from adjacent areas. This negative differential pressure shall be maintained under all conditions.

The HEPA system(s) shall run 24 hours a day for the duration of the project, until acceptable "Final Air" sample results are received and approved by Environmental Health and Safety, and containment or work area tear down is complete.

Requirements for the installation and operation of the system are as follows:

1. Exhaust from HEPA-filtered air systems shall be ducted to the outdoors whenever feasible.
   New exhaust duct shall be used for each project; previously used duct shall be rejected on-site.

2. HEPA filter(s) shall be tightly sealed around their edges/gaskets.

3. The system shall be visually inspected and approved by Environmental Health and Safety or it's representative prior to use.

4. The procedures for use of HEPA negative-pressure systems shall conform to Appendix J of the EPA Guidance Document, "Guidance for Controlling Asbestos Containing Materials in Buildings (June 1985)."

5. The contractor shall maintain "spare" Negative Air Filtration unit(s), of sufficient air movement capacity, on site for use in the event of unit failure. These may need to be stored in the work area depending on the configuration of the containment and decontamination enclosure system(s). Environmental Health and Safety or it's representative shall determine whether the unit(s) must be stored in the work area.

If the HEPA filtration system fails, the Contractor shall immediately seal all entrances to the work area. These entrances shall remain sealed until the HEPA system is again operational.

In the event of an emergency the University may need to penetrate prepared areas to resolve the emergency. Any repairs required by these penetrations will be conducted by the Contractor at no charge to the University.

g. The contractor shall build decontamination enclosure systems at work...
area entrances and exits.

h. The contractor shall remove and clean ceiling mounted objects, such as lights and other items not previously sealed that interfere with the asbestos removal. Use localized water spraying and/or HEPA-filtered vacuum during fixture removal to reduce fiber dispersal.

i. The contractor shall maintain easily visible emergency and fire exits from the work area.

j. After preparing work areas, decontamination enclosure systems and receiving approval from Environmental Health and Safety, the contractor shall remove ceiling panels and tiles within the work areas, clean using a HEPA-filtered vacuum or damp sponge, wrap the clean tiles in 6-mil plastic and store in a location selected by the University or dispose of as contaminated waste in accordance with Section III.B of this specification.

k. Where suspended ceiling system grids, must be removed to make work accessible, the contractor shall clean the grids using a HEPA vacuum and/or wet methods, disconnect from hangers, wrap grid in 6-mil plastic and store or dispose as directed by the University.

l. All areas where asbestos-containing materials are disturbed shall be completely isolated from adjacent areas using wood framed, sealed barriers with 2 layers of 6-mil plastic sheeting on both sides of the frame.

m. The contractor shall seal elevators that may open into work areas with critical seals until “Final Air” samples have been approved by Environmental Health and Safety. Elevator shutdowns shall be the responsibility of the University.

2. Decontamination Enclosure Systems

a. The contractor shall build suitable framing or use existing rooms connected with framed-in tunnels, and line with two layers of plastic, sealed with tape at all plastic joints, for all enclosures and decontamination enclosure system rooms. The plastic shall be placed towards the contaminated area(s) so that the framing material does not become contaminated. Tape and/or glue seams shall NOT be placed on the bottom of the system.

b. In all cases, access between contaminated and uncontaminated rooms or areas shall be through an airlock. Access between any two rooms within the decontamination enclosure systems shall be through a curtained doorway.

c. **Worker Decontamination Enclosure System:**

The contractor shall construct a worker decontamination enclosure system contiguous to the work area consisting of at least three totally enclosed chambers (airlocks) as follows:

- **(1) An equipment room with two curtained doorways, one to the**
work area and one to the shower room.

(2) A shower/washroom with two curtained doorways, one to the equipment room and one to the clean room. The shower room shall contain at least one shower head for each ten (10) employees, as well as, body soap or other appropriate cleansing agents convenient to the showers.

The University shall provide both hot and cold water whenever possible. However, in the event that hot water is not available, the contractor shall supply a portable source of hot water. This unit shall be electrically powered and use 110 VAC as its power source.

Water from the shower shall be collected and filtered, using a 3 to 5 micron filter, prior to disposal into any waste water system. Water shall not be bagged as waste.

(3) A clean room with one curtained doorway into the shower and one curtained entrance to uncontaminated areas of the building. When possible, the clean room shall have sufficient space for storage of street clothes, towels, and other uncontaminated items.

d. **Equipment Decontamination Enclosure System:**

When required, the contractor shall construct an equipment decontamination enclosure system consisting of two totally enclosed chambers as follows:

(1) A washroom, with a curtained doorway to a designated area of the work area and a curtained doorway to the holding area.

(2) A holding area, with a curtained doorway to an uncontaminated area.

3. **Preparation for Glove Bag Removal of Pipe Insulation**

a. If the amount of asbestos-containing pipe insulation to be removed by the glove bag method, is less than or equal to ten (10) linear feet, the work area shall be prepared and air monitored in accordance with all sections of this specification, with the following exceptions:

1. A single layer of 6-mil plastic shall be used to construct the enclosure system. Plastic shall be installed on all walls, floors and surfaces in the work area.

2. The plastic enclosure system shall be connected to at least two airlocks serving as a decontamination enclosure system.

If any personal or area air sample collected inside the work area exceeds the current OSHA PEL for airborne asbestos, a shower shall be installed for proper worker decontamination.
3. “Final Air” samples shall be collected in accordance with this specification. Additional air samples collected outside of the work area shall be collected at the discretion of Environmental Health and Safety or their representative.

b. If the amount of asbestos-containing pipe insulation to be removed by the glove bag method, is greater than ten (10) linear feet, all requirements of this specification will apply.

c. After the removal has been completed and approved by Environmental Health and Safety, a representative number of "Final Air" samples shall be collected and analyzed in accordance with Section IV. of this specification. The number and location of samples shall be at the discretion of Environmental Health and Safety. These samples may encompass locations inside and outside of the work area.

d. The HEPA-filtration system(s) shall continue running and the enclosure shall remain intact until all "Final Air" sample results are approved by Environmental Health and Safety, and containment tear down is complete.

4. Preparation for Transite Removal (Indoor)

All requirements of this specification shall apply with the following exceptions:

a. A single layer of 6-mil plastic sheeting shall be installed on all critical barriers.

b. A single layer of 6-mil plastic sheeting shall be installed on all walls and vertical surfaces in the work area.

c. A minimum of two layers of 6-mil plastic sheeting shall be installed on all floors and horizontal surfaces within the work area and worker decontamination enclosure systems.

5. Preparation for Floor Tile and Mastic Removal and Other Resilient Floorings:

Preparation for the removal of Vinyl Asbestos Tile/Asbestos Sheet Flooring and Mastic using hand tools and chemical strippers shall include all sections of the specification, except plastic sheeting covering walls will consist of only one layer installed up to a height of (6) feet. All other requirements for critical seals, worker decontamination, negative air, precleaning, final cleaning, air sampling, etc. shall still apply.

b. Mechanical Removal - using powered tile removal equipment and shot blasters.

Preparation for the removal of Vinyl Asbestos Tile/Asbestos Sheet Flooring and Mastic using mechanical methods shall include all sections of the specification.

6. Maintenance of Enclosure System by the Contractor:
a. Visually inspect enclosures at the beginning and end of each work period, and periodically throughout the day.

Ensure that barriers, chambers and plastic linings are effectively sealed and taped. Repair damaged barriers and remedy defects immediately upon discovery.

Use smoke methods to test effectiveness of barriers when directed by Environmental Health and Safety or it's representative.

b. Asbestos removal work shall not commence until:

Arrangements have been made for waste disposal at an approved landfill site.

Work areas and decontamination enclosure systems are effectively segregated and have been approved by Environmental Health and Safety or designated representative.

Environmental Health and Safety or it's representative approves of the location, number and air flow rate (cfm) of all HEPA-filtered air pressure systems.

Environmental Health and Safety or it's representative approves the final preparation of the work area.

All other preparatory steps have been taken, applicable notices posted, and permits obtained.

B. Asbestos Removal

1. Glove Bag Removal of Pipe Insulation

a. The Contractor shall use glove bags in the manner described in the most recent EPA or OSHA standards and/or guidelines. Glove bags shall have a minimum thickness of 6-mils. Any damaged, adjacent, pipe insulation within 10 linear feet of the section to be removed, must be repaired with canvas, plaster cloth, trowel-on encapsulant or other original equipment materials prior to the start of any glove bag work.

b. Canvas, plaster cloth, trowel-on encapsulant or other original equipment materials shall be applied to all exposed ends of insulation to prevent fiber release.

c. Penetrating encapsulant shall be applied to all surfaces of pipe where asbestos has been removed.

d. Glove bags shall not be reused or slid along adjacent lengths of pipe insulation.

e. Before leaving the work area, glove bags shall be placed into 6-mil labeled polyethylene bags and sealed, for disposal.
2. Gross Asbestos Removal
   a. Prepare site (see Section III.A)
   b. Spray asbestos material with amended water before and during removal, using spray equipment capable of providing a "mist" application. Saturate the material sufficiently without causing excess dripping or delamination of the material. Spray the asbestos material repeatedly during the work process to maintain a wet condition and to minimize fiber dispersion.
   c. Remove the saturated asbestos material in small sections. As it is removed, pack the material into labeled plastic bags of 6-mil minimum thickness. Material shall not be allowed to dry prior to insertion into the bags.

Transite, removal shall be conducted so as to minimize breakage as much as possible.

Transite shall not be allowed to drop to the floor during removal.

Transite shall either be placed in labeled, plastic lined drums or double wrapped in labeled plastic for disposal. The option of which shall be at the discretion of Environmental Health and Safety or it's representative.

d. All plastic sheeting, tape, cleaning materials, clothing and other disposable material or items used in the removal shall be packed into two plastic bags of 6-mil minimum thickness each for disposal. ALL MATERIALS SHALL BE WETTED PRIOR TO DISPOSAL, INCLUDING PLASTIC, DISPOSABLE COVERALLS, ETC.

e. Seal filled bags using tape and the "goose necking" technique. "Goose necking" meaning sealing waste bags by first twisting the bags, taping, folding the twisted area over and taping again. This shall be conducted on both bags.

Ensure that bags are labeled in accordance with OSHA, EPA NESHAPS and DOT. Clean external surfaces of the bags by wet cleaning in the work area, or equipment room of the worker or equipment Decontamination Enclosure System. Move bags to the shower or washroom, wet clean the exterior of each thoroughly. After cleaning, pass the bag out of the shower or washroom and place into a second "clean" bag before moving to a uncontaminated areas. Ensure that the bags are removed from the clean room by workers who entered from uncontaminated areas dressed in clean clothing. If drums are used, ensure that the exterior of each drum is labeled in accordance with the regulations mentioned above.

f. The Contractor shall transport the sealed bags and drums, if used, to the approved waste disposal site or storage facility at regular intervals without allowing asbestos waste to accumulate inside or outside of the building.

Any asbestos waste transported through a building, elevator or stair
tower must be contained in two (2) sealed 6-mil plastic bags inside of a sealable drum or cart. Bags of waste may be taken out of the drums or carts and placed in an appropriate vehicle once the drums have been transported outside of the building.

g. After completion of gross removal, all surfaces from which asbestos has been removed shall be wire brushed and/or wet sponged, or cleaned by an equivalent method.

Additionally, clean all surfaces in the work area using wet methods and/or a HEPA-filtered vacuum.

Cleaning with leaf blowers may be required by Environmental Health and Safety or it's representative at this time.

This cleanup includes removal of all visible accumulations of material, dust and debris.

h. Upon acceptable visual inspection by the contractor's supervisor via flashlights, Environmental Health and Safety or it's representative shall be asked to inspect the area. Environmental Health and Safety or it's representative shall then conduct a visual inspection, also via flashlights, as soon as possible upon request from the supervisor. After approval from Environmental Health and Safety or it's representative, all surfaces and the inner layer of plastic shall be sprayed with a penetrating encapsulant.

i. All liquid waste produced within the work area or decontamination enclosure system shall be passed through a 3 to 5 micron filter prior to disposal into any waste water system.

3. Asbestos Containing Built-up Roofing Removal

a. Shut down HVAC intake systems and cover and seal roof-mounted HVAC intake vents with plastic and duct tape.

b. Spray asbestos material with amended water before and during removal, using spray equipment capable of providing a "mist" application. Saturate the material sufficiently without causing excess dripping or delamination of the material. Spray the asbestos material repeatedly during the work process to maintain a wet condition and to minimize fiber and dust dispersion.

c. Remove the saturated asbestos roofing material in small sections. As it is removed, immediately transfer the material to the disposal container.

Material **SHALL NOT** be allowed to dry out prior to insertion the disposal container.

d. A covered chute may be used to lower wetted roofing debris to a covered dumpster.

Note: Non-friable, built-up roofing and caulking debris is not considered
“asbestos waste” and, therefore, does not have to be segregated from general roofing/construction waste.

In some cases, disposal in labeled, 6-mil, asbestos disposal bags may be required. This shall be at the discretion of Environmental Health and Safety.

Note: Due to the nature and content of some roofing materials and the logistics of removing materials from the roof area, disposal containers may need to be more substantial than labeled plastic bags which may tear. In this case, disposal may require metal or fiber drums or simply cardboard or burlap liners for labeled plastic bags. This shall be the choice of the contractor; the final required result being that no asbestos waste containers shall be allowed to leak.

Also, in some cases, a lined dumpster may be substituted for smaller containers. This will be at the discretion of Environmental Health and Safety on a case-by-case basis.

e. All plastic sheeting, tape, cleaning materials, clothing and other disposable material or items used in roofing removal shall be packed into two plastic bags of 6-mil minimum thickness each for disposal.

ALL MATERIALS SHALL BE WETTED PRIOR TO DISPOSAL, INCLUDING PLASTIC, DISPOSABLE COVERALLS, ETC.

f. Seal filled bags using tape and the "goose necking" technique. "Goose necking" meaning sealing waste bags by first twisting the bags, taping, folding the twisted area over and taping again. This shall be conducted on both bags separately.

Clean external surfaces of the containers by wet cleaning in the work area, or equipment room of the worker or equipment Decontamination Enclosure System if used.

g. The Contractor shall transport the sealed containers to the approved waste disposal site or storage facility at regular intervals without allowing waste to accumulate.

Any waste transported through a building, elevator or stair tower must be contained in two (2) sealed 6-mil plastic bags inside of a sealable drum or cart. Bags of waste may be taken out of the drums or carts and placed in an appropriate vehicle once the drums have been transported outside of the building.

h. After completion of removal, all surfaces from which asbestos roofing has been removed shall be cleaned using wet methods and/or a HEPA-filtered vacuum.

This cleanup includes removal of all visible accumulations of material, dust and debris.

i. Upon acceptable visual inspection by the contractor's supervisor,
Environmental Health and Safety or OPP or their representative shall be asked to inspect the area. Environmental Health and Safety, OPP or their representative shall then conduct a visual inspection, as soon as possible upon request from the supervisor.

4. Transite Roofing and Siding Removal

a. Transite roofing and siding removal shall be conducted so as to minimize breakage of the material as much as possible.

Transite roofing or siding SHALL NOT be allowed to drop to the ground during removal.

Transite will be removed and treated as non-friable asbestos and as such shall require ALL asbestos licensing, waste manifesting, notification requirements, etc. as friable asbestos as referred in other sections of this specification.

b. All plastic sheeting, tape, cleaning materials, clothing and other disposable material or items used for Transite removal shall be packed into two plastic bags of 6-mil minimum thickness each for disposal.

ALL MATERIALS SHALL BE WETTED PRIOR TO DISPOSAL, INCLUDING PLASTIC, DISPOSABLE COVERALLS, ETC.

c. Seal filled bags using tape and the "goose necking" technique. "Goose necking" meaning sealing waste bags by first twisting the bags, taping, folding the twisted area over and taping again. This shall be conducted on both bags.

Since Transite is an "asbestos waste", ensure that bags, drums, etc. are labeled in accordance with OSHA, EPA NESHAPS and DOT. Clean external surfaces of the containers by wet cleaning in the work area, or equipment room of the worker or equipment Decontamination Enclosure System.

d. The Contractor shall transport the sealed containers to the approved waste disposal site or storage facility at regular intervals without allowing waste to accumulate.

Any waste transported through a building, elevator or stair tower must be contained in two (2) sealed 6-mil plastic bags inside of a sealable drum or cart. Bags of waste may be taken out of the drums or carts and placed in an appropriate vehicle once the drums have been transported outside of the building.

e. After completion of removal, all surfaces from which asbestos roofing has been removed shall be cleaned using wet methods and/or a HEPA-filtered vacuum.

This cleanup includes removal of all visible accumulations of material, dust and debris.

f. Upon acceptable visual inspection by the contractor's supervisor,
Environmental Health and Safety or OPP or their representative shall be asked to inspect the area. Environmental Health and Safety, OPP or their representative shall then conduct a visual inspection, as soon as possible upon request from the supervisor.

g. All liquid waste produced within the Transite removal work area shall be passed through a 3 to 5 micron filter prior to disposal into any waste water system.

C. Final Cleanup of Containment/Work Areas

1. After the encapsulant is dry or tacky, remove the inner layer of plastic sheeting from the walls and floors. The outer layer of plastic and critical seals on windows, doors, and HVAC vents, etc. shall remain in place, and the HEPA-filtered negative air pressure systems shall remain in service.

2. Again clean all surfaces in the work area, including the decontamination enclosure systems, and all other areas used during the asbestos removal process by wet wiping and/or HEPA vacuuming.

   Cleaning with leaf blowers may again be required by Environmental Health and Safety or it's representative at this time.

   This cleanup shall again include removal of all visible accumulations of material, dust and debris.

3. Remove the remaining layer of plastic sheeting from the walls and floors. The windows, doors, and HVAC vents shall remain critically sealed and the HEPA-filtered negative air pressure systems shall remain in service.

4. After cleaning the work area and all other areas included above, the Contractor shall have the option to wait 24 hours to allow dust to settle or be filtered and then wet clean or HEPA-vacuum all surfaces again.

   This waiting period will also allow any residual water or encapsulant to dry.

5. After the area has been cleaned as specified above, the contractor's supervisor shall again inspect all areas, via a flashlight, to determine whether all visible dust has been satisfactorily removed. If the asbestos has been satisfactorily removed, and the area satisfactorily cleaned, the supervisor shall request a visual inspection by Environmental Health and Safety or it's representative. If Environmental Health and Safety, or their representative, finds visible accumulations of debris in any of the areas, the Contractor shall repeat the wet cleaning or HEPA-vacuuming until the work area is satisfactory. Once the work area is deemed satisfactorily cleaned "Final Air" sampling can be conducted.

   a. If the results of the "Final Air" sampling are satisfactory, all remaining plastic sheeting shall be removed, placed into two plastic bags of 6-mil minimum thickness each and transported in accordance with this specification.

   (1) Satisfactory "Final Air" sample results shall be concentrations that are less than or equal to 0.005 fibers/cc using Phase Contrast Microscopy (PCM).
(2) No activities within the project area, such as replacement procedures, may commence until the area is found satisfactory by visual inspection and "Final Air" sampling.

b. If the results of the "Final Air" sampling are not satisfactory, the area shall be wet cleaned or HEPA-vacuumed and inspected until the air samples are satisfactory.

The entire work area must also be dry or "tacky" to the touch before final air sampling is to be conducted (i.e. no visible puddles or droplets of water or encapsulant).

IV. Air Monitoring and Inspection Firm Qualifications and Requirements

A. Air monitoring and visual inspections shall be conducted during indoor asbestos abatement (and outside as determined on a case-by-case basis by Environmental Health and Safety) by an independent firm, hired by the University, General Contractor or Construction Manager, in accordance with the University’s Asbestos Containing Material Removal Performance Specification, applicable NIOSH air sampling methods and the following protocol:

Air monitoring and inspection firms CANNOT be hired by the asbestos contractor.

NOTE: Asbestos air monitoring and inspection firms must be approved by EHS and OPP.

1. Qualifications of personnel conducting on-site air monitoring and visual inspections:

   Air monitoring and inspection firm on-site personnel shall have at least (6) month’s experience in asbestos abatement project inspection, air sampling and analysis. Penn State reserves the right to review, approve and/or reject these on-site personnel.

2. All air samples shall be immediately analyzed "on-site" by:

   a. An analyst whose name appears in the most recent copy of the Asbestos Analysts Registry developed by the American Industrial Hygiene Association (AIHA); or

   c. An analyst who has successfully completed the NIOSH 582 course or an equivalent, and successfully participates in the Proficiency Analytical Testing (PAT) Program, and is employed by an AIHA accredited laboratory.

2. Air monitoring specified below represents the minimum numbers of samples to be collected each day; this may be increased at the discretion of EHS.

<table>
<thead>
<tr>
<th>Minimum #</th>
<th>Minimum Sample</th>
</tr>
</thead>
</table>

Henderson – Biobehavioral Health Building
DGS 800-290/PSU 06-42744/BCJ 08001 20 September 2010
Location | Samples/Day | Volume(liters)
---|---|---
Inside decontamination unit "clean" room | 2 | 1200
Outside work area (at discretion of EHS) | 2 | 1200
Downstream of each HEPA filter exhaust | 1 | 1200

Ten (10) percent of all samples shall be re-analyzed and their concentrations confirmed at an AIHA accredited laboratory. These samples shall be randomly selected and may require approval by Environmental Health and Safety.

B. A representative number of "Final Air" samples shall also be collected, as designated by Environmental Health and Safety.

1. "Final Air" testing will be conducted under aggressive conditions whenever feasible, as directed by EHS. Agitation of the air during sampling will be by either a (1) horsepower leaf blower or stationary fans. If visible dust is disturbed at any time while using leaf blowers or fans, air sampling shall be terminated. The contractor will then reclean the area until no visible dust is seen.

2. All "Final Air" samples shall have a minimum volume of 1200 liters of air and shall show airborne fiber concentrations that are less than or equal to 0.005 fibers/cc using PCM.

3. Additional "Final Air" samples may be requested in each work area, and immediately submitted to Environmental Health and Safety. These samples shall be collected on polycarbonate filters (25-mm) with a pore size of 0.45 micrometers or less (AHERA TEM air sample filters). These samples shall not be analyzed on-site but shall be collected at the same time as the other "Final Air" samples. EHS will become the owner of these samples, which will serve as archive "Final Air" samples.

C. All area and "Final Air" samples shall be collected and analyzed by the independent air monitoring and inspection firm. The Contractor shall not collect or analyze any air samples for the University.

D. All air sampling shall be conducted in accordance with the method prescribed in applicable EPA and OSHA guidelines.

1. Air sampling pumps shall be calibrated before and after each use and record of this calibration shall be furnished to EHS.

E. Daily air samples collected outside of the work area, from the beginning of removal activities until satisfactory "Final Air" samples are attained (less than or equal to 0.005 fibers/cc).

The Contractor or the University may choose to collect background samples in
proximity to the work area, prior to the start of any preparation or removal activities. A minimum sample volume of 1200 liters shall be collected for the background samples. The samples may be analyzed using PCM (NIOSH 7400A) or Transmission Electron Microscopy (TEM).

If a sample reading above 0.005 fibers/cc is obtained outside of the work area, the Contractor shall take immediate, corrective action under the supervision of EHS or it's representative. Corrective action includes but is not limited to: collection of additional air samples, HEPA vacuuming or wet wiping of contaminated areas, and construction of additional airtight barriers.

Corrective actions shall be conducted until all samples outside the work area are once again below 0.005 fibers/cc or background concentration.

F. A written report and invoice shall be submitted to Environmental Health and Safety within 45 days of the satisfactory completion of the project. Additional copies shall not be sent to other departments within the University. EHS will distribute as needed after review and approval.

The report shall include:

a. Report/Cover Letter describing the general details of the project (i.e. scope of work, contractor representative, EHS contact, start and end dates, etc. This report should preferably be written by the person(s) on-site at the time of the work.

b. Diagram of containment area showing daily and final air test locations, containment boundary, decontamination unit and negative air machine layout, etc. Building floorplans for this purpose will be provided by PSU when possible.

c. Project monitor's daily log sheets, both hand written, and if needed for legibility, typed.

Log entries will be expected to be concise, but detailed enough so that the unfamiliar can follow job progress, conversations, decisions, etc. Entries will be made every half-hour at the minimum and must show the time of day. Logs sheets will also have the project monitor's printed name, signature and date. This information will be on all pages, which will be numbered.

d. Daily checklists for projects that require the project monitor to record number of negative air machines, manometer readings, proper glovebag use, containment integrity, etc. "No" or "unchecked" responses shall be corrected and explained fully either on the checklist or in daily logs.

e. Field sampling data sheets that contain sample number, sample date, air pump pre- and post-calibration data, sample time-on and time-off, total sampling time, average sample flow rate, sample description, location, results, etc. These shall also show project monitor's printed name, signature and date.
Typed sample data sheets may be required for legibility and ease of cataloging.

f. Air sample fiber count sheets that show the number of fibers counted in each sample and which grid the fibers were seen. These shall also show sample number, collection date, sampler's printed name/signature, date of analysis, analyst's printed name, signature and date, etc.

g. Asbestos Worker Daily Sign-In Sheet with printed names, signatures and PA Department of Labor and Industry license Number.

Those without valid photo-ID or a receipt from the PA Department of Labor and Industry shall not be allowed to conduct asbestos removal activities (Preparation activities or assistant activities outside the work are allowable.).

Anything typed or duplicated (i.e. daily logs, sample data, computer generated drawings, etc.) shall include the corresponding handwritten notes/information, data, drawing, etc. that it was transcribed from.

G. Although not required by this specification, it is highly recommended that the Contractor conduct air sampling inside the work area during preparation and removal in accordance with all applicable OSHA standards.

Prepared By: Michael J. Burke, Industrial Hygiene Specialist
PA Labor & Industry Project Designer #001970
Appendix A

ASBESTOS REMOVAL SCOPE OF WORK

**Project Duration:** Asbestos Contractor to provide duration, in days, with bid.

**Work Plan:** Asbestos Contractor to provide with bid. Plan must show planned work area layout, decon and negative air placement, phasing, etc.

**Pre-Bid Meeting:** To be scheduled by Construction Manager or General Contractor.

Asbestos Containing Materials:

1. Floor Tile – Found throughout area. Some may be under carpet, furniture and / or partition walls.
   a. Mastic is NOT asbestos.

2. Sheet Flooring and Black Edge Strips – Found on ramps to Henderson North.
   a. Mastic is NOT asbestos.

3. Pipe fitting insulations – May be found above ceilings or within walls.
   a. To be removed via wrap-and-cut and / or negative pressure glovebags, within same containments as flooring.
   b. Set up to consist of critical seals and drop cloths on floors only.

**Notes:**

1. Plastic sheeting not required on walls in flooring containment areas (only decontamination unit and critical seals on windows, doors, vents, etc).
2. Floor tile and sheet goods to be wetted and removed as intact as possible with hand tools.
3. Carpet to be removed by Asbestos Contractor. To be disposed as construction debris if floor tile not attached. If small amounts of tile attached, cut tile away and separate waste accordingly. If large amounts of tile attached dispose of all as non-friable asbestos waste.
4. Asbestos Contractor to conduct small-scale, exploratory demolition of partition walls, plaster / CMU walls, drop ceilings, etc. to locate, access and remove floor tile and pipe fitting insulation as needed.
5. Asbestos Contractor to coordinate furniture / cabinetry removal with Construction Manager, as needed.
6. Lightly encapsulate floors and walls with a **clear** product after asbestos removal and fine cleaning.
7. Blank blockplan attached for Work Plan, etc.
8. Prevailing Wages apply.

Miscellaneous Non-Asbestos Materials

**Fluorescent light tubes** – Remove and package **ALL** tubes in accordance with PSU Safety Policy SY31 LAMP USE AND DISPOSAL ([http://guru.psu.edu/policies/sy31.html](http://guru.psu.edu/policies/sy31.html)). PSU EHS will provide containers and dispose.
Appendix A - Continued

Fluorescent light fixture ballasts – Remove and dispose only PCB containing ballasts in accordance with PSU Safety Policy SY26 FLUORESCENT LIGHT BALLAST/CAPACITOR DISPOSAL (http://guru.psu.edu/policies/sy26.html). PSU EHS will provide containers and dispose.

Mercury thermostats and switches – Remove and package intact. PSU will provide containers and dispose. Coordinate electric and heat shut downs with Penn State.
## Appendix B

### Unit Price Quotation Request

In the event that unexpected Asbestos Containing Materials are discovered, in addition to the Scope of Work in Appendix A, the University also requests that a quotation be submitted for the following Unit Price Items

**(NOTE: Removal / repair related items assume a containment was / is previously constructed):**

<table>
<thead>
<tr>
<th>Item Description</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Construct and dismantle a 3 stage decontamination unit with clean room, shower, and dirty room.</td>
<td>_____EA</td>
</tr>
<tr>
<td>2. Construct and dismantle a 2-stage decontamination unit with clean and dirty room.</td>
<td>_____EA</td>
</tr>
<tr>
<td>3. Cover critical seals with one layer of 6-mil polyethylene sheeting.</td>
<td>_____SF</td>
</tr>
<tr>
<td>4. Cover walls with one layer of 6-mil polyethylene sheeting.</td>
<td>_____SF</td>
</tr>
<tr>
<td>5. Cover floors with one layer of 6-mil polyethylene sheeting.</td>
<td>_____SF</td>
</tr>
<tr>
<td>6. Patch and seal damaged pipe, fitting or duct insulation using patching cement, bridging encapsulant, and/or wettable fiberglass or plaster wrap.</td>
<td>_____LF</td>
</tr>
<tr>
<td>7. Glove Bag pipe insulation up to and including 4 inch OD.</td>
<td>_____LF</td>
</tr>
<tr>
<td>8. Glove Bag pipe insulation &gt;4&quot; OD up to and including 8&quot; OD.</td>

Appendix C

WORK PHASING / SCHEDULE / MANPOWER / WORKING HOURS

Work Phasing / Scheduling

Penn State OPP, EHS and the chosen air monitoring firm will be kept appraised of all schedules and phasing in advance of start of work.

NOTE: The air monitoring firm will not be expected to work extra hours for air sampling to “clear” work areas due to inadequate contractor planning or manpower.

Manpower

The Asbestos Contractor is expected to supply the appropriate manpower to complete the project in the allotted schedule.

If temporary labor is employed and workers’ native language is not English, the Asbestos Contractor must ensure there are an adequate number of supervisors who are fluent in the appropriate native language(s) of the workers.

Working Hours

Due to regulatory requirements, emergency egress and occupant safety issues, asbestos-related work often requires special scheduling and planning considerations.

Publicly Accessible Areas - Lobbies, Corridors, Open Rooms or Stairs

- All asbestos handling in these areas must be conducted during non-occupied hours such as nights, weekends or breaks.
- Set up can occur at any time as long as public access or egress is not impeded.
- Emergency exceptions must be evaluated and approved by EHS, case-by-case.
- Corridors and/or stairs cannot be blocked during normal occupancy or class use hours, unless there are adequate alternate emergency egress pathways.

Non-Publicly Accessible Areas – Closed Rooms, Corridors, Stairs, Renovation or Construction Areas

- Removal where decontamination units or other equipment must be placed in publicly accessible areas must be conducted during non-occupied hours such as nights, weekends or breaks (Example: decon entrance opens into occupied corridor or negative air exhaust must run through the corridor or an adjacent room).
- Set up can occur at any time as long as public access or egress is not impeded.
- Emergency exceptions must be evaluated and approved by EHS on a case-by-case basis.
Appendix D

Approved Asbestos Contractors and Site Visit Requirements

The most up-to-date listing of prequalified asbestos contractors is located on the OPP Prequalified Contractors Search webpage at:

http://apps.opp.psu.edu/BiddersList/search.cfm
Appendix E

Approved Air Monitoring and Inspection Firms

Air monitoring and inspection services are to be contracted separately by Penn State.

However, the chosen General and Asbestos Contractors will be expected to work closely and coordinate all work and scheduling with the chosen consultant, PSU OPP and EHS.
SECTION H7 – PRIME CONTRACTOR PREQUALIFICATION FORM

PROJECT: Penn State; Henderson Bridge Replacement Building
Date of Prequalification Form Submission: ____ / ____ / ____

Please email, mail, or fax the completed form to George Germany at Massaro Corporation by or before 10/04/2010 to participate in bidding the packages listed below.

Attn: George Germany
Manager, Subcontractor Relations
Massaro Corporation
120 Delta Drive
Pittsburgh, PA 15238-2806
t. 412-963-2800
f. 412-967-9915
ggermany@massarocorporation.com

Criteria utilized in prequalifying subcontractors/vendors for this project:
• Safety Record (EMR < 1.0)
• Financial means to complete project
• Similar project experience
• BIM capabilities (Structural Steel, Fire Prot, Plumbing, HVAC, Electrical)
• LEED Project Experience

Bid Package (w/ Approx. Budgets) – Please Check the Package(s) you intend to submit a bid:

___ 1 Hazardous Building Materials Abatement 800-290.HA1.1 ($30k)
___ 2 Building Demolition 800-290.BD2.1 ($115k)
___ 3 General Trades 800-290.GC3.1 ($25.4m)
___ 4 Fire Protection 800-290.5 ($360k)
___ 5 Plumbing 800-290.3 ($730k)
___ 6 HVAC 800-290.2 ($4.1m)
___ 7 Electric 800-290.EL1.4 ($2.9m)
___ 8 Telecommunications 800-290.TL2.4 (Low Voltage Systems ($1.25m)
___ 9 Landscaping 800-290.LA4.1 ($425k)

SAFETY:

YEAR ⇒ Workers’ Compensation Experience Modification Rate for last three years.
NOTE: If EMR Average for last three years in over 1.0, you must submit an OSHA 200 log for each year with this response.

Have you had any OSHA fines within the last three years? YES NO
Have you had any jobsite fatalities within the last three years? YES NO

If you have answered YES to either of the above two questions, you MUST submit on separate sheet the details describing the circumstances surrounding each incident.

GENERAL:

Years in business under present name (minimum of three years required): ______________
Years performing work specialty (minimum of three years required): _____________________
Current Cost to Complete Backlog: $____________________
Annual Revenue Last Year: $____________________
Average Annual Revenue Over Last Three Years: $____________________

What trades of work do you usually perform with your own forces: __________________________________

% of work performed by own forces: ____________%

Will your project foreman for this project have OSHA 30 hour training? __________

Are you a certified WBE, MBE, or DBE? __________ If yes, which? _____________________________
Certified thru (DGS, PADOT, etc.)? _______________ Please also attach a certificate.

Are you currently or have you worked with Massaro Corporation in the Past?

END OF PREQUALIFICATION FORM
PART 1 - GENERAL

1.1 SUMMARY

A. The work of this Section shall be performed and coordinated between the University Arborist, PSU Facilities personnel and the General Contractor. All other work by the Contractor must be coordinated with this Section when working in areas near Tree Protection fencing.

B. Section specifies the procedures and sequencing for Tree Protection, and Preservation between the Contractor and University Arborist.
   1. Site visits by the University Arborist.
   2. Installation of Tree Protection measures by the Contractor.
   3. Tree root pruning prior to construction activities by the University Arborist.
   4. Installation of tree protection, air spading and aeration mats to minimize root compaction by the University Arborist.
   5. General tree maintenance during construction by the University Arborist.
   6. Specific Arboriculture Actions by the University Arborist.

C. Related Sections include the following:
   1. Division 2 Section “Unit Paving”, for installation of brick paving.
   2. Division 2 Section “Concrete”, for installation of the paver base.

1.2 REFERENCES

A. Publications listed herein are part of this specification to extent referenced.

B. Standard Practices for Trees, Shrubs, and Other Woody Plant Maintenance, Cabling, Guying, Lightning Protection, ANSI A300

C. ANSI Z133 Tree Care Operations - Safety Standards

1.3 DEFINITIONS

A. Diameter: Is defined as diameter at breast height (DBH) that is the average tree diameter at 4.5 feet from the ground on the uphill side of the tree.

B. Caliper: Is defined as the diameter of the trunk at 6” above the soil for trees up to 6” in caliper and diameter at 12” above the soil for trees up to 12” caliper.

C. Critical Root Zone (CRZ): Is defined as that area of roots within a circle measured by a radius of 1.5 feet from the trunk for every inch of diameter of the trunk, or as depicted on the Tree Protection Plan.

D. Tree Preservation Area: Is defined as all areas outside limits of construction, which contain trees and all areas within the limits of construction that is designated on the plans and/or in the field by fencing and signage.
E. Limit of Disturbance: Is defined, as areas of excavation, or fills for site grading, walkways and/or utility easements and alignments required for the construction of the work, near or within the tree preservation areas.

F. Soil Protection Zones: Are defined as soil areas that shall not be turned, excavated, compacted, or altered in anyway.

G. Damage: Is defined as any unauthorized encroachment into the tree preservation areas and soils protection zones beyond the limits of work as indicated on the civil drawings whether fencing is present or not and at any time during the construction process including the paver installation and fine grading operations.

H. University Arborist is the Pennsylvania State University's approved representative to review and monitor the implementation of the tree protection, impact reduction and arboricultural action measures. University Arborist or their personnel shall perform the work of the tree protection measures and remediation measures. University Arborist shall monitor as needed and report violations of preservation or changes in the implementation of the specifications, when necessary.

1.4 SUBMITTALS

A. Provide data on the following operations for proper coordination of the tree protection measures, as well as any last minute alterations to the site utility work that may adversely impact existing mature trees.
   1. Site lighting, and electrical conduit runs; provide shop drawings to the University Arborist for any runs that may impact tree preservation.
   2. Final Paving Layout and elevation cut sheets.
   3. Any change to the designated concrete washout areas.

1.5 QUALITY ASSURANCE

A. Preconstruction Conference: University Arborist shall conduct a reinstallation conference at the project site to comply with the requirements in Division 1 Section “Project Meetings”.
   1. Before Contractor commences tree-fencing work, he shall meet with the University Arborist, consultants and other interested entities.
   2. Review the scope, methods and procedures for tree protection work as well as the project specifications to reduce or mitigate impacts to the existing trees.
   3. Notify participants at least three working days prior to convening the conference.
   4. Record discussions and agreements, and furnish a copy to each participant.

1.6 PROJECT CONDITIONS

A. Construction Activity: No construction, including staging and stockpile shall start until all the tree protection measures and procedures are completed as designated on the Tree Protection Plan, and approved by the University Arborist.

B. Bring conflicts between the Drawings and site conditions to the University Representative for clarification prior to commencing tree protection work.

C. Diameters of all trees to be preserved have been recorded on the Tree Protection Plan, prior to construction and shall be the basis for assessment of replacement trees damaged by construction activities.
1.7 PROCEDURES FOR TREE PRESERVATION

A. Review of Tree Protection Plan and Limits of Disturbance (LOD).
   1. The Contractor shall meet with the Architect and/or University’s Representative, University Arborist, in the field to review the location of trees to be preserved, the limits of Construction, the sequence for installation of tree protection and the conversion of the Pedestrian/ Bike path into the Construction Access road.
   2. Any potential conflicts between construction plans and preservation requirements shall be discussed and/or brought to the University Representative at that time.

B. Projected Sequence of Tree Preservation Measures by University Arborist prior to Contractor activities:
   1. Tree Identification
   2. Air Spading
   3. Root Pruning
   4. Root Mulching
   5. Installation of Root Protection Mats and Filter Fabrics
   6. Crown Pruning and Trunk and Major Limb Protection Measures

C. Projected Sequence of Tree Preservation Measures by Contractor after Arborist but prior to construction activities:
   1. Installation of Tree Protection Fencing
   2. Installation of Silt Fencing
   3. Installation of Aggregate base for Construction Access Road.

D. Fencing Adjustments required during Construction.
   1. University Arborist must approve and closely monitor any work within the Tree Preservation areas. The University Arborist must approve any fence removal or relocation required by the work and will supervise the reinstallation. Any conflicts or compromises that will affect the preserved tree long term shall be reported to the Architect and University Representative. Written approval is required prior to operation of any heavy equipment in CRZ area. Any opening of tree preservation areas during construction for foot or equipment traffic or any construction activities shall be accompanied by soil compaction reduction measures such as min. 6” wood chips as specified in Section 2.7 or geo-textile matting with plywood. Protect all woody parts of trees from abrasion when fence is down.
   2. Any damage to trees to be preserved caused by the activities of the contractor or his subcontractors shall be subject to review by the University Arborist. Reasonable remediation activities will be as designated in Section 3.12 and 3.13.

1.8 SITE MONITORING

A. The University Arborist may conduct daily site visits to insure contractor compliance with tree preservation measures.

B. Contact the University Arborist for any questions or concerns regarding Tree Preservations measures.
PART 2 - PRODUCTS

2.1 TREE PROTECTION FENCING (To be provided by the Contractor)

A. Construction Staging Fencing:
   1. 6 ft height chain link fencing, with welded wire: 3x3" maximum mesh, 14 gauge; with, high visibility, heavy duty ('Arctic'), plastic flagging @ 5' O.C., in 2' lengths.

B. Silt Fencing:
   1. As required on the Civil Engineering drawings and the City of Baltimore approved Erosion Control Drawings.

C. Limit of Disturbance, Walkway and Utility Limits:
   1. 36" Blaze Orange Plastic Safety Fencing as a minimum, and as required by JHU field representative for pedestrian safety.
   2. Posts: Steel T- Bar or heavy duty U-bar fence post, 5' Ht. @ 10’ O.C. or as required.

D. Tree Preservation Fencing
   1. 6’ Chain Link with hollow steel posts anchored 2’ into the ground. Posts shall be a maximum of 10’ apart.

2.2 UNIVERSITY SUPPLIED ITEMS (As Required)

A. Root Protection and Aeration Mats
B. Root-Bio-Stimulant
C. Vertical Mulching
D. Control Agents
E. Integrated Pest Management (IPM)
F. Mulch or Wood chips
G. Cables And Hardware

PART 3 - EXECUTION

3.1 AIR SPADE TRENCHING (To be Coordinated by the University)

A. University Arborist personnel shall excavate trees within the CRZ impacted by the Construction Access Road by utilizing Air Spade Trenching techniques as required protect and prune roots.

B. Care shall be exercised so as not to damage the exterior membrane of existing exposed tree roots and root flares.

C. Air trench no greater an area than that required to install the Access Road or as required to complete work and minimally expose tree root systems. Arborist shall determine which roots shall be preserved and which roots can be cut.
D. Grades within CRZ shall remain, as close to existing as possible in order to minimize gravel fill over roots or root removal of structural roots. Where soil must be brought to grade over existing tree roots then Arborist shall install soil aeration matting over roots prior to backfill operations where the change exceeds 2". Do not fill within 18" of trunk.

3.2 **ROOT PRUNING** (To be Coordinated with the University)

A. Root pruning shall be performed in conjunction with fencing when excavation will occur and where deemed necessary by the University Arborist.

B. Root pruning shall be performed wherever grades will be lowered within the Critical Root Zone of a significant tree to be preserved as specified by the University Arborist.

C. Roots over 2" in diameter shall have a clean cut made on the surface of the root, which is still attached to the tree. This cut shall be made with a handsaw or chain saw as soon as larger root is severed.

D. Where backfilling around tree roots is delayed Arborist may protect exposed roots with moist burlap and plastic tarps. Do not remove to allow roots to dry out during air trenching operations.

3.3 **INSTALLATION OF ROOT PROTECTION & AERATION MATTING** (To be Coordinated with the University)

A. University Arborist will place protection mats as required to protect existing roots for construction impacts.

B. In other areas Soil Separation Fabric may be used to protect existing grades from compaction by aggregates.

3.4 **PRUNING** (To be Coordinated with the University)

A. Pruning will be undertaken by the University Arborist on to remove any hazard branches, crossing branches, dying or diseased branches, or the formative pruning of branches.

B. Crown Cleaning, Thinning, Raising or Reduction will be performed by the University Arborist.
   1. Consideration should also be given to the type, extent, and nature of the pruning required and the ability of the tree species to sustain this type of pruning.

3.5 **MULCHING** (To be Coordinated with the University)

A. Arborist shall mulch designated trees with root zones to be impacted by construction within the CRZ by construction activities.

B. Arborist shall determine depth of mulch layers in tree preservation fencing and within CRZ. Mulch shall be kept at least six inches from the trunk of all trees. The mulch ring shall have a minimum radius of 6 inches per foot of trunk diameter, or six feet, whichever is greater. Root prune lines for grading or excavations shall have mulch applied as above, up to the root prune line, and length of the applicable Critical Root Zone.
3.6 TREE PROTECTION FENCING (To be performed by the Contractor)

A. Contractor shall install tree protection fencing in locations shown on the drawings or as adjusted by the University Arborist. Installation to be coordinated with Contractor after root pruning, mulching and mat protection is installed. Maintain fencing in good repair at original locations throughout construction period, or until site work, including all soil installation or preparation not within the tree protection areas is complete. If work is required to be done with the tree protection area it shall be done by written approval.

B. Install the Orange Blaze fencing to designate the Limits of Construction (LOC) outside the tree preservation fencing to limit impacts to the CRZ of existing trees. Fencing shall be maintained in good repair until no longer required to contain the contractor's construction activity within the CRZ's.

C. Any issues, which arise during construction that may require relocation of protective fencing, will require written approval from University Arborist, or Architect.

D. If fences should become damaged, fall down or are no longer functional, the Contractor shall repair or replace the fence the day it is damaged and shall assume liability for any damages that may occur to trees or vegetation within the protected areas and if Contractor fails to repair fence, they will be liable for all costs incurred by the University for having fence repaired.

E. All construction activity within the areas fenced off around the trees shall be prohibited. This shall include the following activities:
   1. Parking or driving of equipment, machinery or vehicles of any type.
   2. Foot traffic.
   3. Storage of any construction materials, equipment, stockpiling, excavation or fill, soil, gravel, etc.
   4. Dumping of any chemicals, (i.e. paint thinner from cleaning brushes), wash-out materials from cleaning equipment, concrete or mortar remainder, trash, garbage, or debris of any kind
   5. Trenching or grading within the critical root zones of protected trees for any purpose without notifying University Arborist within 5 days in advance of operation in writing. This includes but is not limited to the following: silt fence, sediment erosion control, utilities, site lighting, pavement installations, drainage etc.

3.7 SILT PREVENTION (To be performed by the Contractor)

A. The locations of silt fencing shall be as indicated on the Civil Engineers Erosion Control plans. Additional silt fencing shall be installed as necessary to prevent silt from entering Tree Protection and Preservation areas.

B. Silt and stone dust shall not be allowed to collect in preservation areas. Silt accumulating in preservation areas shall constitute damage and will require remedial activity for its removal. All silt will be removed from preservation areas within 48 hours of siltation. The methods and procedures for silt removal within tree preservation areas will be approved and monitored by the University Arborist. If silt is not removed within the 48 hours specified, Contractor will be liable for all costs incurred by University for having it removed. Additional remedial activity such as aeration, fertilization, and mulching may also be required.

C. Alterations to the approved grading plans may be required due to unforeseen surface drainage problems or modifications to site plans. Any changes to the grading plan, which may result in the accumulation of silt within Tree Protection or Preservation Areas, shall require the Contractor to install additional silt fencing to prevent siltation of these areas.
D. Silt fencing and other devices shall not be removed until site is stabilized and potential for siltation of preservation areas is controlled. Any silt accumulating following the removal of silt fencing shall be removed within 48 hours.

3.8 GENERAL EXCAVATION PROCEDURES WITH CRITICAL ROOT ZONES (CRZ)

A. Protection of existing trees adjacent to excavation and fills, involves the following operations; removal of excavated soils or pavements, root pruning, placement of fills, and protection of root systems from construction equipment tires and tracks.

B. Demolition and removal existing pavements and curbs within the CRZ’S shall be done in a manner to minimize damage and further compaction to existing tree roots below pavements. Use means and methods that effectively pulls or lifts these materials away from the tree trunks and deposited in pieces for hauling outside the CRZ.

C. Excavated fill dirt should be placed away from CRZ. If no room exists due to structures or adjacent trees, fill dirt may be placed on Root Protection Matting, comprised of plywood, geotextile, or steel mat or other suitable "deck" to contain the fill and minimize compaction and mechanical damage to surface roots. Other means of protecting roots from damage due to excavated fill can be approved by the (University Arborist). Planking or other decking may be necessary when backhoes or tracked equipment is operating within the CRZ. Turning and rutting within this area shall be avoided. University Arborist will identify trees requiring additional protection prior to excavation.

D. Root pruning should take place prior to excavation with equipment as designated on the Tree Preservation Plan by the designated Contract Arborist as noted above. Root Pruning may be necessary after demolition but prior to construction of site walls. Contractor shall contact University Arborist if roots are encountered during construction of site walls and paving outside of tree preservation areas.

E. Equipment damage that scars trunks and major limbs should be avoided. Protecting a trunk from mechanical damage with plywood, geo-textile, fencing as may be necessary when work is very close. Over-hanging limbs shall be pulled and tied out of the way for small trees and branches. The designated University Arborist shall prune larger low hanging limbs if under 4” c. or work out additional protection measures. Contractor shall not prune trees under any condition. These situations can be reviewed in a preconstruction walk through or during layout of work. These protection measures shall be the responsibility of the designated University Arborist.

3.9 FERTILIZATION AND ROOT BIOSTIMULATION

A. All designated significant trees shall receive root stimulation as recommended by the University Arborist.

B. Refer to label instructions for rates of application for the bio-stimulant.

3.10 INTEGRATED PEST MANAGEMENT

A. University Arborist shall provide an IPM technician and equipment to make necessary treatments. University Arborist shall also report any other issues observed on site that may affect the survival of trees.
B. Watering shall be included in IPM program. Water shall be applied to key trees during site inspection visits whenever soil moisture is below 40% of field capacity.

3.11 OTHER REMEDIAL ACTIVITIES

A. University Arborist will provide other Arboricultural services as necessary to respond to damage by construction activities. These services may include any of the above, as well as vertical mulching/aeration, silt removal, fence repair, pruning, removals, soil replacement, etc.

B. Trees with weak structural characteristics shall be cabled using appropriate size hardware.

C. Reports of damage and recommended remediation shall be provided to the University Representative for determination of Contractor's liability.

3.12 TREE REPAIR AND REPLACEMENT

A. Contractor to promptly repair trees damaged by construction operations with 24 hours. Remove and replace dead and damaged trees that the determined to be incapable of restoring to a normal growth pattern.

B. The University Arborist may enlist an ASCA registered Consulting Arborist to evaluate the tree in question and recommend compensation if there is a conflict.

C. Compensation for Damages:
   1. Minor Damage: The University Arborist will assess the Contractor a penalty fee of $75 per square inch of damaged areas on tree trunks and major limbs, not to exceed the value of the tree, for injuries caused by the Contractor.
   2. Major Damage: If the University Arborist or ASCA registered Consulting Arborist determine that damages to tree(s) caused by the contractor will either cause the eventual death of a tree or have the affected tree's normal growth pattern to the point that it cannot be restored, the University will assess the Contractor the value of the tree as determined by the Consulting Arborist.
   3. Tree Value: The value of the tree may be established by one of the following methods, depending on the tree trunk caliper.
      a. Tree Caliper less than 6 inches: Value will be based on replacement cost.
      b. Tree Caliper 6 inches and greater: Value will be determined ISA Valuation Method, 2000
   4. For trees less than 6 inches in caliper, provide new trees of the same size and species as those being replaced; plant and maintain for a period of One Year from the date of planting.
   5. For trees larger than 6 inches in caliper, provide as many new trees as required to match the value of the assessed damages, install trees at a minimum 6 inch in caliper size as measured according to ANLA standards, and of a species selected by the Architect and/ or University. Plant and maintain for a period of One Year from the date of planting.

END OF SECTION - 01 5639
SECTION 01 73 29 - CUTTING AND PATCHING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes procedural requirements for cutting and patching.

B. Related Sections include the following:
   1. Division 01 Section "Selective Structure Demolition" for demolition of selected portions of the building.
   2. Divisions 02 through 49 Sections for specific requirements and limitations applicable to cutting and patching individual parts of the Work.
   3. Division 07 Section "Penetration Firestopping" for patching fire-rated construction.

1.3 DEFINITIONS

A. Cutting: Removal of in-place construction necessary to permit installation or performance of other Work.

B. Patching: Fitting and repair work required to restore surfaces to original conditions after installation of other Work.

1.4 SUBMITTALS

A. Cutting and Patching Proposal: Submit a proposal describing procedures at least 10 days before the time cutting and patching will be performed, requesting approval to proceed. Include the following information:
   1. Extent: Describe cutting and patching, show how they will be performed, and indicate why they cannot be avoided.
   2. Changes to In-Place Construction: Describe anticipated results. Include changes to structural elements and operating components as well as changes in building's appearance and other significant visual elements.
   3. Products: List products to be used and firms or entities that will perform the Work.
   4. Dates: Indicate when cutting and patching will be performed.
   5. Utility Services and Mechanical/Electrical Systems: List services/systems that cutting and patching procedures will disturb or affect. List services/systems that will be relocated and those that will be temporarily out of service. Indicate how long services/systems will be disrupted.
   6. Structural Elements: Where cutting and patching involve adding reinforcement to structural elements, submit details and engineering calculations showing integration of reinforcement with original structure.
   7. Architect's Approval: Obtain approval of cutting and patching proposal before cutting and patching. Approval does not waive right to later require removal and replacement of unsatisfactory work.

1.5 QUALITY ASSURANCE

A. Structural Elements: Do not cut and patch structural elements in a manner that could change their load-carrying capacity or load-deflection ratio.
B. Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that result in increased maintenance or decreased operational life or safety. Operating elements include the following:
1. Primary operational systems and equipment.
2. Air or smoke barriers.
3. Fire-suppression systems.
4. Mechanical systems piping and ducts.
5. Control systems.
6. Communication systems.
7. Conveying systems.
8. Electrical wiring systems.

C. Miscellaneous Elements: Do not cut and patch miscellaneous elements or related components in a manner that could change their load-carrying capacity that results in reducing their capacity to perform as intended, or that result in increased maintenance or decreased operational life or safety. Miscellaneous elements include the following:
1. Water, moisture, or vapor barriers.
2. Membranes and flashings.
3. Exterior curtain-wall construction.
4. Equipment supports.
5. Piping, ductwork, vessels, and equipment.

D. Visual Requirements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch construction exposed on the exterior or in occupied spaces in a manner that would, in Architect's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner.

1.6 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during cutting and patching operations, by methods and with materials so as not to void existing warranties.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Comply with requirements specified in other Sections.

B. In-Place Materials: Use materials identical to in-place materials. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.
1. If identical materials are unavailable or cannot be used, use materials that, when installed, will match the visual and functional performance of in-place materials.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces to be cut and patched and conditions under which cutting and patching are to be performed.
1. Compatibility: Before patching, verify compatibility with and suitability of substrates, including compatibility with in-place finishes or primers.
2. Proceed with installation only after unsafe or unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Temporary Support: Provide temporary support of Work to be cut.

B. Protection: Protect in-place construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.

C. Adjoining Areas: Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.

3.3 PERFORMANCE

A. General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay.

   1. Cut in-place construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.

B. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations.

   1. In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots as small as possible, neatly to size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.

   2. Finished Surfaces: Cut or drill from the exposed or finished side into concealed surfaces.

   3. Concrete and Masonry: Cut using a cutting machine, such as an abrasive saw or a diamond-core drill.

   4. Excavating and Backfilling: Comply with requirements in applicable Division 31 Sections where required by cutting and patching operations.

   5. Mechanical and Electrical Services: Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit to prevent entrance of moisture or other foreign matter after cutting.

   6. Proceed with patching after construction operations requiring cutting are complete.

C. Patching: Patch construction by filling, repairing, refinishing, closing up, and similar operations following performance of other Work. Patch with durable seams that are as invisible as possible. Provide materials and comply with installation requirements specified in other Sections.

   1. Inspection: Where feasible, test and inspect patched areas after completion to demonstrate integrity of installation.

   2. Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will eliminate evidence of patching and refinishing.

      a. Clean piping, conduit, and similar features before applying paint or other finishing materials.

      b. Restore damaged pipe covering to its original condition.

   3. Floors and Walls: Where walls or partitions that are removed extend one finished area into another, patch and repair floor and wall surfaces in the new space. Provide an even surface of uniform finish, color, texture, and appearance. Remove in-place floor and wall coverings and replace with new materials, if necessary, to achieve uniform color and appearance.

      a. Where patching occurs in a painted surface, apply primer and intermediate paint coats over the patch and apply final paint coat over entire unbroken surface containing the patch. Provide additional coats until patch blends with adjacent surfaces.

   4. Ceilings: Patch, repair, or rehang in-place ceilings as necessary to provide an even-plane surface of uniform appearance.
5. Exterior Building Enclosure: Patch components in a manner that restores enclosure to a weathertight condition.

D. Cleaning: Clean areas and spaces where cutting and patching are performed. Completely remove paint, mortar, oils, putty, and similar materials.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 01 73 29
SECTION 01 74 19 - CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes administrative and procedural requirements for the following:

1. Salvaging nonhazardous demolition and construction waste.
2. Recycling nonhazardous demolition and construction waste.
3. Disposing of nonhazardous demolition and construction waste.

B. Related Requirements:

1. Division 02 Section "Structure Demolition" for disposition of waste resulting from demolition of buildings, structures, and site improvements.
2. Division 02 Section "Selective Structure Demolition" for disposition of waste resulting from partial demolition of buildings, structures, and site improvements.
3. Division 04 Section "Unit Masonry" for disposal requirements for masonry waste.
4. Division 04 Section "Stone Masonry" for disposal requirements for excess stone and stone waste.
5. Division 31 Sections for disposition of waste resulting from site clearing and removal of above- and below-grade improvements.

1.3 DEFINITIONS

A. Construction Waste: Building and site improvement materials and other solid waste resulting from construction, remodeling, renovation, or repair operations. Construction waste includes packaging.

B. Demolition Waste: Building and site improvement materials resulting from demolition or selective demolition operations.

C. Disposal: Removal off-site of demolition and construction waste and subsequent sale, recycling, reuse, or deposit in landfill or incinerator acceptable to authorities having jurisdiction.

D. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.

E. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.

F. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.
1.4 PERFORMANCE REQUIREMENTS

A. General: Achieve end-of-Project rates for salvage/recycling of 75 percent by weight of total non-hazardous solid waste generated by the Work. Practice efficient waste management in the use of materials in the course of the Work. Use all reasonable means to divert construction and demolition waste from landfills and incinerators. Facilitate recycling and salvage of materials, including the following:

1. Demolition Waste:
   a. Asphalt paving.
   b. Concrete.
   c. Concrete reinforcing steel.
   d. Brick.
   e. Concrete masonry units.
   f. Wood studs.
   g. Wood joists.
   h. Plywood and oriented strand board.
   i. Wood paneling.
   j. Wood trim.
   k. Structural and miscellaneous steel.
   l. Rough hardware.
   m. Roofing.
   n. Insulation.
   o. Doors and frames.
   p. Door hardware.
   q. Windows.
   r. Glazing.
   s. Metal studs.
   t. Gypsum board.
   u. Acoustical tile and panels.
   v. Carpet.
   w. Carpet pad.
   x. Demountable partitions.
   y. Equipment.
   z. Cabinets.
   aa. Plumbing fixtures.
   bb. Piping.
   cc. Supports and hangers.
   dd. Valves.
   ee. Sprinklers.
   ff. Mechanical equipment.
   gg. Refrigerants.
   hh. Electrical conduit.
   ii. Copper wiring.
   jj. Lighting fixtures.
   kk. Lamps.
   ll. Ballasts.
   mm. Electrical devices.
   nn. Switchgear and panelboards.
   oo. Transformers.

2. Construction Waste:
   a. Masonry and CMU.
   b. Lumber.
   c. Wood sheet materials.
d. Wood trim.
e. Metals.
f. Roofing.
g. Insulation.
h. Carpet and pad.
i. Gypsum board.
j. Piping.
k. Electrical conduit.
l. Packaging: Regardless of salvage/recycle goal indicated in "General" Paragraph above, salvage or recycle 100 percent of the following uncontaminated packaging materials:
   1) Paper.
   2) Cardboard.
   3) Boxes.
   4) Plastic sheet and film.
   5) Polystyrene packaging.
   7) Plastic pails.

m. Waste from On-Site Personnel:
   1) Paper.
   2) Cardboard.
   3) Plastic bottles and containers.
   4) Aluminum cans.
   5) Tin cans.
   6) Newspaper.
   7) Glass bottles and containers.

1.5 ACTION SUBMITTALS

A. Waste Management Plan: Submit plan within 7 days of date established for the Notice to Proceed.

1.6 INFORMATIONAL SUBMITTALS

A. Waste Reduction Progress Reports: Concurrent with each Application for Payment, submit report. Use separate forms for construction waste and demolition waste. Form format shall be as acceptable to the Owner and Architect to fully document on-site waste management activities. Include the following information:
   1. Material category.
   2. Generation point of waste.
   3. Total quantity of waste in tons.
   4. Quantity of waste salvaged, both estimated and actual in tons.
   5. Quantity of waste recycled, both estimated and actual in tons.
   6. Total quantity of waste recovered (salvaged plus recycled) in tons.
   7. Total quantity of waste recovered (salvaged plus recycled) as a percentage of total waste.

B. Waste Reduction Calculations: Before request for Substantial Completion, submit calculated end-of-Project rates for salvage, recycling, and disposal as a percentage of total waste generated by the Work.

C. Records of Donations: Indicate receipt and acceptance of salvageable waste donated to individuals and organizations. Indicate whether organization is tax exempt.
D. Records of Sales: Indicate receipt and acceptance of salvageable waste sold to individuals and organizations. Indicate whether organization is tax exempt.

E. Recycling and Processing Facility Records: Indicate receipt and acceptance of recyclable waste by recycling and processing facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.

F. Landfill and Incinerator Disposal Records: Indicate receipt and acceptance of waste by landfills and incinerator facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.

G. LEED Submittal: LEED letter template for Credit MR 2.1 and Credit MR 2.2, signed by Contractor, tabulating total waste material, quantities diverted and means by which it is diverted, and statement that requirements for the credit have been met.

H. Qualification Data: For waste management coordinator and refrigerant recovery technician.

I. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

1.7 QUALITY ASSURANCE

A. Waste Management Coordinator Qualifications: Experienced firm, with a record of successful waste management coordination of projects with similar requirements, that employs a LEED-Accredited Professional, certified by the USGBC, as waste management coordinator. Waste management coordinator may also serve as LEED coordinator.

B. Refrigerant Recovery Technician Qualifications: Certified by EPA-approved certification program.

C. Regulatory Requirements: Comply with hauling and disposal regulations of authorities having jurisdiction.

D. Waste Management Conference: Conduct conference at Project site to comply with requirements in Division 01 Section "Project Management and Coordination." Review methods and procedures related to waste management including, but not limited to, the following:

1. Review and discuss waste management plan including responsibilities of waste management coordinator.
2. Review requirements for documenting quantities of each type of waste and its disposition.
3. Review and finalize procedures for materials separation and verify availability of containers and bins needed to avoid delays.
4. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
5. Review waste management requirements for each trade.

1.8 WASTE MANAGEMENT PLAN

A. General: Develop a waste management plan according to ASTM E 1609 and requirements in this Section. Plan shall consist of waste identification, waste reduction work plan, and cost/revenue analysis. Distinguish between demolition and construction waste. Indicate quantities by weight or volume, but use same units of measure throughout waste management plan.
B. Waste Identification: Indicate anticipated types and quantities of demolition, site-clearing and construction waste generated by the Work. Use separate forms for construction waste and demolition waste. Form format shall be as acceptable to the Owner and Architect to fully document on-site waste management activities. Include estimated quantities and assumptions for estimates.

C. Waste Reduction Work Plan: List each type of waste and whether it will be salvaged, recycled, or disposed of in landfill or incinerator. Use separate forms for construction waste and demolition waste. Form format shall be as acceptable to the Owner and Architect to fully document on-site waste management activities. Include points of waste generation, total quantity of each type of waste, quantity for each means of recovery, and handling and transportation procedures.

1. Salvaged Materials for Reuse: For materials that will be salvaged and reused in this Project, describe methods for preparing salvaged materials before incorporation into the Work.
3. Recycled Materials: Include list of local receivers and processors and type of recycled materials each will accept. Include names, addresses, and telephone numbers.
4. Disposed Materials: Indicate how and where materials will be disposed of. Include name, address, and telephone number of each landfill and incinerator facility.
5. Handling and Transportation Procedures: Include method that will be used for separating recyclable waste including sizes of containers, container labeling, and designated location where materials separation will be performed.

D. Cost/Revenue Analysis: Indicate total cost of waste disposal as if there was no waste management plan and net additional cost or net savings resulting from implementing waste management plan. Use separate forms for construction waste and demolition waste. Form format shall be as acceptable to the Owner and Architect to fully document on-site waste management activities. Include the following:

1. Total quantity of waste.
2. Estimated cost of disposal (cost per unit). Include hauling and tipping fees and cost of collection containers for each type of waste.
3. Total cost of disposal (with no waste management).
4. Revenue from salvaged materials.
5. Revenue from recycled materials.
7. Savings in hauling and tipping fees that are avoided.
8. Handling and transportation costs. Include cost of collection containers for each type of waste.
9. Net additional cost or net savings from waste management plan.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 PLAN IMPLEMENTATION

A. General: Implement approved waste management plan. Provide handling, containers, storage, signage, transportation, and other items as required to implement waste management plan during the entire duration of the Contract.

1. Comply with operation, termination, and removal requirements in Division 01 Section "Temporary Facilities and Controls."
B. Waste Management Coordinator: Engage a waste management coordinator to be responsible for implementing, monitoring, and reporting status of waste management work plan. Coordinator shall be present at Project site full time for duration of Project.

C. Training: Train workers, subcontractors, and suppliers on proper waste management procedures, as appropriate for the Work.

1. Distribute waste management plan to everyone concerned within three days of submittal return.
2. Distribute waste management plan to entities when they first begin work on-site. Review plan procedures and locations established for salvage, recycling, and disposal.

D. Site Access and Temporary Controls: Conduct waste management operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Designate and label specific areas on Project site necessary for separating materials that are to be salvaged, recycled, reused, donated, and sold.
2. Comply with Division 01 Section "Temporary Facilities and Controls" for controlling dust and dirt, environmental protection, and noise control.

E. Waste Management in existing Campus Areas: Hauling equipment and other materials shall be of sizes that clear surfaces within buildings, landscaped spaces, areas, rooms, and openings, by 12 inches or more.

3.2 SALVAGING DEMOLITION WASTE

A. Salvaged Items for Reuse in the Work: Salvage items for reuse and handle as follows:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers with label indicating elements, date of removal, quantity, and location where removed.
3. Store items in a secure area until installation.
4. Protect items from damage during transport and storage.
5. Install salvaged items to comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make items functional for use indicated.

B. Salvaged Items for Sale: Not permitted.

C. Salvaged Items for Owner's Use: Salvage items for Owner's use and handle as follows:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers with label indicating elements, date of removal, quantity, and location where removed.
3. Store items in a secure area until delivery to Owner.
4. Transport items to Owner's storage area designated by Owner.
5. Protect items from damage during transport and storage.

D. Doors and Hardware: Brace open end of door frames. Except for removing door closers, leave door hardware attached to doors.

E. Equipment: Drain tanks, piping, and fixtures. Seal openings with caps or plugs. Protect equipment from exposure to weather.

F. Plumbing Fixtures: Separate by type and size.
G. Lighting Fixtures: Separate lamps by type and protect from breakage.

H. Electrical Devices: Separate switches, receptacles, switchgear, transformers, meters, panelboards, circuit breakers, and other devices by type.

3.3 RECYCLING DEMOLITION AND CONSTRUCTION WASTE, GENERAL

A. General: Recycle paper and beverage containers used by on-site workers.

B. Recycling Receivers and Processors: Locate available recycling receivers and processors within the region of the project:

C. Recycling Incentives: Revenues, savings, rebates, tax credits, and other incentives received for recycling waste materials shall be documented by the Construction Manager for the Project Records and shared equally by Owner and Contractor.

D. Preparation of Waste: Prepare and maintain recyclable waste materials according to recycling or reuse facility requirements. Maintain materials free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process.

E. Procedures: Separate recyclable waste from other waste materials, trash, and debris. Separate recyclable waste by type at Project site to the maximum extent practical according to approved construction waste management plan.

   1. Provide appropriately marked containers or bins for controlling recyclable waste until removed from Project site. Include list of acceptable and unacceptable materials at each container and bin.
      a. Inspect containers and bins for contamination and remove contaminated materials if found.
      b. Refer to “OWNER'S REQUIREMENTS” in Section 02 41 16 Structure Demolition and Section 02 41 19 Selective Structure Demolition for proper disposal instructions for demolition of painted materials.

   2. Stockpile processed materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
   3. Stockpile materials away from construction area. Do not store within drip line of remaining trees.
   4. Store components off the ground and protect from the weather.
   5. Remove recyclable waste from Owner's property and transport to recycling receiver or processor.

3.4 RECYCLING DEMOLITION WASTE

A. Asphalt Paving: Grind asphalt to maximum 1-1/2-inch size.

   1. Crush asphaltic concrete paving and screen to comply with requirements in Division 31 Sections for use as general fill, if permitted.

B. Asphalt Paving: Break up and transport paving to asphalt-recycling facility.

C. Concrete: Remove reinforcement and other metals from concrete and sort with other metals.

   1. Pulverize concrete to maximum 1-1/2-inch size.
2. Crush concrete and screen to comply with requirements in Division 31 Sections for use as satisfactory soil for fill or subbase, if permitted.

D. Masonry: Remove metal reinforcement, anchors, and ties from masonry and sort with other metals.
   1. Pulverize masonry to maximum 1-1/2-inch size.
      a. Crush masonry and screen to comply with requirements in Division 31 Sections for use as general fill, satisfactory soil for fill or subbase, if permitted.
      b. Crush masonry and screen to comply with requirements in Division 32 Section "Plants" for use as mineral mulch, if permitted.
   2. Clean and stack undamaged, whole masonry units on wood pallets.

E. Wood Materials: Sort and stack members according to size, type, and length. Separate lumber, engineered wood products, panel products, and treated wood materials.

F. Metals: Separate metals by type.
   1. Structural Steel: Stack members according to size, type of member, and length.
   2. Remove and dispose of bolts, nuts, washers, and other rough hardware.

G. Asphalt Shingle Roofing: Separate organic and glass-fiber asphalt shingles and felts. Remove and dispose of nails, staples, and accessories.

H. Gypsum Board: Stack large clean pieces on wood pallets or in container and store in a dry location. Remove edge trim and sort with other metals. Remove and dispose of fasteners.

I. Acoustical Ceiling Panels and Tile: Stack large clean pieces on wood pallets and store in a dry location.

J. Metal Suspension System: Separate metal members including trim, and other metals from acoustical panels and tile and sort with other metals.

K. Carpet and Pad: Roll large pieces tightly after removing debris, trash, adhesive, and tack strips.
   1. Store clean, dry carpet and pad in a closed container or trailer provided by Carpet Reclamation Agency or carpet recycler.

L. Carpet Tile: Remove debris, trash, and adhesive.
   1. Stack tile on pallet and store clean, dry carpet in a closed container or trailer provided by Carpet Reclamation Agency or carpet recycler.

M. Piping: Reduce piping to straight lengths and store by type and size. Separate supports, hangers, valves, sprinklers, and other components by type and size.

N. Conduit: Reduce conduit to straight lengths and store by type and size.

3.5 RECYCLING CONSTRUCTION WASTE

A. Packaging:
   1. Cardboard and Boxes: Break down packaging into flat sheets. Bundle and store in a dry location.
3. Pallets: As much as possible, require deliveries using pallets to remove pallets from Project site. For pallets that remain on-site, break down pallets into component wood pieces and comply with requirements for recycling wood.
4. Crates: Break down crates into component wood pieces and comply with requirements for recycling wood.

B. Wood Materials:

1. Clean Cut-Offs of Lumber: Grind or chip into small pieces.
2. Clean Sawdust: Bag sawdust that does not contain painted or treated wood.
   a. Comply with requirements in Division 32 Section "Plants." for use of clean sawdust as organic mulch.

C. Gypsum Board: Stack large clean pieces on wood pallets or in container and store in a dry location.

1. Clean Gypsum Board: Grind scraps of clean gypsum board using small mobile chipper or hammer mill. Screen out paper after grinding.
   a. Comply with requirements in Division 32 Section "Plants." for use of clean ground gypsum board as inorganic soil amendment, if permitted.

3.6 DISPOSAL OF WASTE

A. General: Except for items or materials to be salvaged, recycled, or otherwise reused, remove waste materials from Project site and legally dispose of them in a landfill or incinerator acceptable to authorities having jurisdiction.

1. Except as otherwise specified, do not allow waste materials that are to be disposed of accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.

B. Burning: Do not burn waste materials.

C. Disposal: Remove waste materials from Owner's property and legally dispose of them.

END OF SECTION 01 74 19
SECTION 01 81 13 - SUSTAINABLE DESIGN REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes general requirements and procedures for compliance with certain USGBC LEED prerequisites and credits needed for Project to obtain LEED-Certified certification based on LEED-NC, Version 2.2.

1. Other LEED prerequisites and credits needed to obtain LEED certification depend on material selections and may not be specifically identified as LEED requirements. Compliance with requirements needed to obtain LEED prerequisites and credits may be used as one criterion to evaluate substitution requests and comparable product requests.

2. Additional LEED prerequisites and credits needed to obtain the indicated LEED certification depend on Architect's design and other aspects of Project that are not part of the Work of the Contract.

3. A copy of the LEED Project checklist is attached at the end of this Section for general information and delineation of responsibilities related to LEED certification requirements.

B. Related Sections:

1. Divisions 01 through 33 Sections for LEED requirements specific to the work of each of these Sections. Requirements may or may not include reference to LEED.

1.3 DEFINITIONS

A. Chain-of-Custody Certificates: Certificates signed by manufacturers certifying that wood used to make products was obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship." Certificates shall include evidence that manufacturer is certified for chain of custody by an FSC-FSC-accredited certification body.

B. LEED: Leadership in Energy & Environmental Design.

C. Rapidly Renewable Materials: Materials made from plants that are typically harvested within a 10-year or shorter cycle. Rapidly renewable materials include products made from bamboo, cotton, flax, jute, straw, sunflower seed hulls, vegetable oils, or wool.

D. Regional Materials: Materials that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site. If only a fraction of a product or material is extracted/harvested/recovered and manufactured locally, then only that percentage (by weight) shall contribute to the regional value.

E. Recycled Content: The recycled content value of a material assembly shall be determined by weight. The recycled fraction of the assembly is then multiplied by the cost of assembly to determine the recycled content value.
1. "Post-consumer" material is defined as waste material generated by households or by commercial, industrial, and institutional facilities in their role as end users of the product, which can no longer be used for its intended purpose.

2. "Pre-consumer" material is defined as material diverted from the waste stream during the manufacturing process. Excluded is reutilization of materials such as rework, regrind, or scrap generated in a process and capable of being reclaimed within the same process that generated it.

1.4 SUBMITTALS

A. General: Submit additional LEED submittals required by other Specification Sections.

B. LEED submittals are in addition to other submittals. If submitted item is identical to that submitted to comply with other requirements, submit duplicate copies as a separate submittal to verify compliance with indicated LEED requirements.

C. Project Materials Cost Data: Provide statement indicating total cost for materials used for Project. Costs exclude labor, overhead, and profit. Include breakout of costs for the following categories of items:

1. Fixed Furniture.
2. Plumbing.
3. Mechanical.
4. Electrical.
5. Specialty items such as elevators and equipment.

D. LEED Action Plans: Provide preliminary submittals within days of date established for the Notice to Proceed indicating how the following requirements will be met:

1. Credit MR 2.1 and Credit MR 2.2: Waste management plan complying with Division 01 Section "Construction Waste Management and Disposal."
2. Credit MR 4.1 and Credit MR 4.2: List of proposed materials with recycled content. Indicate cost, post-consumer recycled content, and pre-consumer recycled content for each product having recycled content.
3. Credit MR 5.1, Credit MR 5.2 and Credit ID 1.1: List of proposed regional materials. Identify each regional material, including its source, cost, and the fraction by weight that is considered regional.
4. Credit MR 7 and Credit ID 1.2: List of proposed certified wood products. Indicate each product containing certified wood, including its source and cost of certified wood products.

E. LEED Progress Reports: Concurrent with each Application for Payment, submit reports comparing actual construction and purchasing activities with LEED action plans for the following:

1. Credit MR 2.1 and Credit MR 2.2: Waste reduction progress reports complying with Division 01 Section "Construction Waste Management and Disposal."
2. Credit MR 4.1 and Credit MR 4.2: Recycled content.
3. Credit MR 5.1, Credit MR 5.2 and ID 1.1: Regional materials.
4. Credit MR 7 and Credit ID 1.2: Certified wood products.

F. LEED Documentation Submittals:

1. Credit MR 2.1 and Credit MR 2.2: Comply with Division 01 Section "Construction Waste Management and Disposal."
2. Credit MR 4.1 and Credit MR 4.2: Product data and certification letter indicating percentages by weight of post-consumer and pre-consumer recycled content for products having recycled content. Include statement indicating costs for each product having recycled content.

3. Credit MR 5.1, Credit 5.2 and Credit ID 1.1: Product data for regional materials indicating location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating cost for each regional material and the fraction by weight that is considered regional.

4. Credit MR 7 and Credit ID 1.2: Product data and chain-of-custody certificates for products containing certified wood. Include statement indicating cost for each certified wood product.

5. Credit EQ 3.1:
   a. Construction indoor-air-quality management plan.
   b. Product data for temporary filtration media.
   c. Product data for filtration media used during occupancy.
   d. Construction Documentation: Six photographs at three different times during the construction period, along with a brief description of the SMACNA approach employed, documenting implementation of the indoor-air-quality management measures, such as protection of ducts and on-site stored or installed absorptive materials.

6. Credit EQ 3.2:
   a. Signed statement describing the building air flush-out procedures including the dates when flush-out was begun and completed and statement that filtration media was replaced after flush-out.
   b. Product data for filtration media used during flush-out and during occupancy.
   c. Report from testing and inspecting agency indicating results of indoor-air-quality testing and documentation showing compliance with indoor-air-quality testing procedures and requirements.

7. Credit EQ 4.1: Product data for adhesives and sealants used inside the weatherproofing system indicating VOC content of each product used. Indicate VOC content in g/L calculated according to 40 CFR 59, Subpart D.

8. Credit EQ 4.2: Product data for paints and coatings used inside the weatherproofing system indicating VOC content of each product used. Indicate VOC content in g/L calculated according to 40 CFR 59, Subpart D.

9. Credit EQ 4.3: Product data for each type of carpet verifying compliance with the requirements of the Carpet and Rug Institute Green Label program, and product data for each type of adhesive verifying compliance with the requirements of Credit EQ 4.1: VOC limit of 50 g/L.

10. Credit EQ 4.4: Product data for products containing composite wood or agrifiber products or wood glues indicating that they do not contain urea-formaldehyde resin.

1.5 QUALITY ASSURANCE

A. LEED Coordinator: Engage an experienced LEED-Accredited Professional to coordinate LEED requirements. LEED coordinator may also serve as waste management coordinator.

PART 2 - PRODUCTS

2.1 RECYCLED CONTENT OF MATERIALS

A. Credit MR 4.1 and Credit MR 4.2: Provide building materials with recycled content such that post-consumer recycled content plus one-half of pre-consumer recycled content constitutes a minimum of 20 percent of cost of materials used for Project.
1. Cost of post-consumer recycled content of an item shall be determined by dividing weight of post-consumer recycled content in the item by total weight of the item and multiplying by cost of the item.
2. Cost of pre-consumer recycled content of an item shall be determined by dividing weight of pre-consumer recycled content in the item by total weight of the item and multiplying by cost of the item.
3. Do not include plumbing, mechanical and electrical components, and specialty items such as elevators and equipment in the calculation.

2.2 REGIONAL MATERIALS

A. Credit MR 5.1, Credit MR 5.2 and Credit ID 1.1: Provide a minimum of 30 percent of building materials (by cost) that are regional materials.

2.3 CERTIFIED WOOD

A. Credit MR 7 and Credit ID 1.2: Provide a minimum of 75 percent (by cost) of wood-based materials that are produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

1. Wood-based materials include, but are not limited to, the following materials when made from wood, engineered wood products, or wood-based panel products:
   a. Rough carpentry.
   b. Miscellaneous carpentry.
   c. Heavy timber construction.
   d. Wood decking.
   e. Metal-plate-connected wood trusses.
   f. Structural glued-laminated timber.
   g. Finish carpentry.
   h. Architectural woodwork.
   i. Wood paneling.
   j. Wood veneer wall covering.
   k. Wood flooring.
   l. Wood lockers.
   m. Wood cabinets.
   n. Fixed Furniture.

2.4 LOW-EMITTING MATERIALS

A. Credit EQ 4.1: For field applications that are inside the weatherproofing system, use adhesives and sealants that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D:

1. Wood Glues: 30 g/L.
2. Metal to Metal Adhesives: 30 g/L.
3. Adhesives for Porous Materials (Except Wood): 50 g/L.
4. Subfloor Adhesives: 50 g/L.
5. Plastic Foam Adhesives: 50 g/L.
6. Carpet Adhesives: 50 g/L.
7. Carpet Pad Adhesives: 50 g/L.
8. VCT and Asphalt Tile Adhesives: 50 g/L.
9. Cove Base Adhesives: 50 g/L.
10. Gypsum Board and Panel Adhesives: 50 g/L.
11. Rubber Floor Adhesives: 60 g/L.
12. Ceramic Tile Adhesives: 65 g/L.
13. Multipurpose Construction Adhesives: 70 g/L.
14. Fiberglass Adhesives: 80 g/L.
15. Contact Adhesive: 80 g/L.
16. Structural Glazing Adhesives: 100 g/L.
17. Wood Flooring Adhesive: 100 g/L.
18. Structural Wood Member Adhesive: 140 g/L.
19. Special Purpose Contact Adhesive (contact adhesive that is used to bond melamine covered board, metal, unsupported vinyl, Teflon, ultra-high molecular weight polyethylene, rubber or wood veneer 1/16 inch or less in thickness to any surface): 250 g/L.
20. Top and Trim Adhesive: 250 g/L.
21. Plastic Cement Welding Compounds: 250 g/L.
22. ABS Welding Compounds: 325 g/L.
23. CPVC Welding Compounds: 490 g/L.
24. PVC Welding Compounds: 510 g/L.
25. Adhesive Primer for Plastic: 550 g/L.
26. Sheet Applied Rubber Lining Adhesive: 850 g/L.
27. Aerosol Adhesive, General Purpose Mist Spray: 65 percent by weight.
29. Special Purpose Aerosol Adhesive (All Types): 70 percent by weight.
30. Other Adhesives: 250 g/L.
31. Architectural Sealants: 250 g/L.
32. Nonmembrane Roof Sealants: 300 g/L.
33. Single-Ply Roof Membrane Sealants: 450 g/L.
34. Other Sealants: 420 g/L.
35. Sealant Primers for Nonporous Substrates: 250 g/L.
36. Sealant Primers for Porous Substrates: 775 g/L.
37. Modified Bituminous Sealant Primers: 500 g/L.
38. Other Sealant Primers: 750 g/L.

B. Credit EQ 4.2: For field applications that are inside the weatherproofing system, use paints and coatings that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D:

1. Flat Paints, Coatings, and Primers: VOC not more than 50 g/L.
2. Nonflat Paints, Coatings, and Primers: VOC not more than 150 g/L.
3. Anticorrosive and Antirust Paints Applied to Ferrous Metals: VOC not more than 250 g/L.
4. Clear Wood Finishes, Varnishes: VOC not more than 350 g/L.
5. Clear Wood Finishes, Lacquers: VOC not more than 550 g/L.
6. Floor Coatings: VOC not more than 100 g/L.
7. Shellacs, Clear: VOC not more than 730 g/L.
8. Shellacs, Pigmented: VOC not more than 550 g/L.
9. Stains: VOC not more than 250 g/L.
10. Dry-Fog Coatings: VOC not more than 400 g/L.
11. Zinc-Rich Industrial Maintenance Primers: VOC not more than 340 g/L.
12. Pretreatment Wash Primers: VOC not more than 420 g/L.
13. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight total aromatic compounds (hydrocarbon compounds containing one or more benzene rings).
14. Restricted Components: Paints and coatings shall not contain any of the following:
   a. Acrolein.
   b. Acrylonitrile.
   c. Antimony.
   d. Benzene.
   e. Butyl benzyl phthalate.
   f. Cadmium.
g. Di (2-ethylhexyl) phthalate.
h. Di-n-butyl phthalate.
i. Di-n-octyl phthalate.
j. 1,2-dichlorobenzene.
k. Diethyl phthalate.
l. Dimethyl phthalate.
m. Ethylbenzene.
n. Formaldehyde.
o. Hexavalent chromium.
p. Isophorone.
q. Lead.
r. Mercury.
s. Methyl ethyl ketone.
t. Methyl isobutyl ketone.
u. Methylene chloride.
v. Naphthalene.
w. Toluene (methylbenzene).
x. 1,1,1-trichloroethane.
y. Vinyl chloride.

C. Credit EQ 4.3: Only use carpets that meet the requirements of the Carpet and Rug Institute Green Label program. Only use adhesives that meet the requirements of Credit EQ 4.1.

D. Credit EQ 4.4: Do not use composite wood or agrifiber products or adhesives that contain urea-formaldehyde resin.

PART 3 - EXECUTION

3.1 REFRIGERANT AND CLEAN-AGENT FIRE-EXTINGUISHING-AGENT REMOVAL

A. Prerequisite EA 3: Remove CFC-based refrigerants from existing HVAC&R equipment indicated to remain and replace with refrigerants that are not CFC based. Replace or adjust existing equipment to accommodate new refrigerant as described in Division 23 Sections.

B. Credit EA 4: Remove clean-agent fire-extinguishing agents that contain HCFCs or halons and replace with agent that does not contain HCFCs or halons. See Division 21 Section "Clean-Agent Fire Extinguishing Systems" for additional requirements.

3.2 CONSTRUCTION WASTE MANAGEMENT

A. Credit MR 2.1 and Credit MR 2.2: Comply with Division 01 Section "Construction Waste Management and Disposal."

3.3 CONSTRUCTION INDOOR-AIR-QUALITY MANAGEMENT

A. Credit EQ 3.1: Comply with SMACNA’s "SMACNA IAQ Guideline for Occupied Buildings under Construction."

1. If Owner authorizes use of permanent heating, cooling, and ventilating systems during construction period as specified in Division 01 Section "Temporary Facilities and Controls," install filter media having a MERV 8 according to ASHRAE 52.2 at each return-air inlet for the air-handling system used during construction.

2. Replace all air filters immediately prior to occupancy.
B. Credit EQ 3.2: Comply with one of the following requirements:

1. After construction ends, prior to occupancy and with all interior finishes installed, perform a building flush-out by supplying a total volume of 14000 cu. ft. of outdoor air per sq. ft. of floor area while maintaining an internal temperature of at least 60 deg F and a relative humidity no higher than 60 percent.

2. If occupancy is desired prior to flush-out completion, the space may be occupied following delivery of a minimum of 3500 cu. ft. of outdoor air per sq. ft. of floor area to the space. Once a space is occupied, it shall be ventilated at a minimum rate of 0.30 cfm per sq. ft. of outside air or the design minimum outside air rate determined in EQ Prerequisite 1, whichever is greater. During each day of the flush-out period, ventilation shall begin a minimum of three hours prior to occupancy and continue during occupancy. These conditions shall be maintained until a total of 14000 cu. ft./sq. ft. of outside air has been delivered to the space.

3. Air-Quality Testing:

   a. Conduct baseline indoor-air-quality testing, after construction ends and prior to occupancy, using testing protocols consistent with the EPA's "Compendium of Methods for the Determination of Air Pollutants in Indoor Air," and as additionally detailed in the USGBC's "LEED-NC: Reference Guide."

   b. Demonstrate that the contaminant maximum concentrations listed below are not exceeded:

      1) Formaldehyde:  50 ppb.
      2) Particulates (PM10):  50 micrograms/cu. m.
      3) Total Volatile Organic Compounds (TVOC):  500 micrograms/cu. m.
      4) 4-Phenylcyclohexene (4-PH):  6.5 micrograms/cu. m.
      5) Carbon Monoxide:  9 ppm and no greater than 2 ppm above outdoor levels.

   c. For each sampling point where the maximum concentration limits are exceeded, conduct additional flush-out with outside air and retest the specific parameter(s) exceeded to indicate the requirements are achieved. Repeat procedure until all requirements have been met. When retesting noncomplying building areas, take samples from same locations as in the first test.

   d. Air-sample testing shall be conducted as follows:

      1) All measurements shall be conducted prior to occupancy but during normal occupied hours, and with building ventilation system starting at the normal daily start time and operated at the minimum outside air flow rate for the occupied mode throughout the duration of the air testing.
      2) Building shall have all interior finishes installed including, but not limited to, millwork, doors, paint, carpet, and acoustic tiles. Nonfixed furnishings such as workstations and partitions are encouraged, but not required, to be in place for the testing.
      3) Number of sampling locations will vary depending on the size of building and number of ventilation systems. For each portion of building served by a separate ventilation system, the number of sampling points shall not be less than one per 25,000 sq. ft. or for each contiguous floor area, whichever is larger, and shall include areas with the least ventilation and greatest presumed source strength.
      4) Air samples shall be collected between 3 and 6 feet from the floor to represent the breathing zone of occupants, and over a minimum four-hour period.
THIS PAGE INTENTIONALLY LEFT BLANK
1.1 WORK INCLUDED

A. Commissioning requirements common to all Sections
B. Systems and equipment ‘Start-Up’ and ‘Functional Performance Testing’
C. Validation of proper and thorough installation of systems and equipment
D. Equipment performance verification
E. Documentation of tests, procedures, and installations
F. Coordination and requirements of ‘Training Events’
G. Preparation and logistics of Systems Manual content
H. Management of record construction documentation
I. Sequencing

1.2 GENERAL DESCRIPTION

A. Commissioning (Cx) is the process of ensuring that all building systems are installed and perform interactively according to the design intent; that systems are efficient and cost effective and meet the Owner’s operational needs; that the installation is adequately documented; and that the Operators are adequately trained. Commissioning serves as a tool to minimize post-occupancy operational problems, and establishes testing and communication protocols to advance the building systems from installation to optimized, fully-dynamic operation.

B. Commissioning Authority (CxA) shall work with the Contractor and the design engineers to direct and oversee the Cx process and perform Functional Performance Testing.

C. The Commissioning Plan outlines the Cx process beyond the Construction Contract, including design phase activities and design team/owner responsibilities. The specification Sections dictate all requirements of the commissioning process relative to the construction contract. The Cx Plan is not part of the construction contract, although it is available for reference at the request of the Contractor.

D. This Section and other sections of the specification details the Contractor’s responsibilities relative to the Cx process. It expands on the Cx Plan, which covers the roles and responsibilities of Parties outside of the construction contract.

1.3 SCOPE

A. This Section covers elements, requirements, procedures, and protocols common across all Divisions of the work. Requirements specific to individual Sections are generally specified in the technical specification as well as a dedicated Section for each of Divisions 22, 23, 25 and 26.

B. Specific systems to be commissioned are indicated in the following Divisions of the Specification:
1. Divisions 02–12, 14: Conformance to the following provisions of the Cx requirements is required under Division 01 and this Section:
   a. ‘Equipment and Systems Training’ as required by individual Sections;
   b. Systems Manual preparation and maintenance;
   c. Record Document preparation and maintenance.
2. Division 22 – Plumbing: Requirements for Cx are specified in Section 22 08 00 as well as in individual Division 22 Sections.
3. Division 23 - HVAC: Requirements for Cx are specified in Section 23 08 00 as well as in individual Division 23 Sections.
4. Division 26 – Electrical: Requirements for Cx are specified in Section 26 08 00 as well as in individual Division 26 Sections.
5. Division 25 – BAS: Requirements for Cx are specified in Section 25 08 00 as well as in individual Division 25 Sections.

1.4 RELATED WORK AND DOCUMENTS

A. Commissioning Plan: The Cx Plan outlines responsibilities outside of the construction contract and shall be available to all Parties for reference. It gives the Contractor a perspective with respect to the overall process. It encompasses the entire Cx process including design phase and post construction tasks.

B. Project Manual, Section 12: scheduling requirements related to the Cx process.

C. Project Manual, Section 17: submittal requirements, startup and closeout procedures, operation and maintenance data, warranties, project record documents and training related to the Cx process.

D. Section 01 91 00 – General Commissioning Requirements: Details the Cx requirements common across all divisions.

E. Section 01 91 10 – Functional Testing Procedures: Outlines ‘generic’ Functional Testing Procedures required for specific system types subject to the Cx process.

F. Individual Specification Sections: Individual Sections stipulate installation, start-up, warranty, O&M documentation, and training requirements for the system or device specified in the Section.

G. Section 22 08 00 – Plumbing Systems Commissioning: Details the Cx procedures specific to Plumbing Systems work.

H. Section 23 08 00 – HVAC Systems Commissioning: Details the Cx procedures specific to HVAC work.

I. Section 26 08 00 – Electrical Systems Commissioning: Details the Cx procedures specific to Electrical Systems work.

J. Section 25 08 00 – Building Automation Systems (BAS) Commissioning: Details the Cx procedures specific to the Building Automation System.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Acceptance Phase: This is the phase of the project when the facility and its systems and equipment are inspected, tested, verified, and documented; and when most of the Functional Performance Testing and final training occurs. This will generally occur after the Construction Phase is complete (after Start-Up Documentation has been completed). The Acceptance
Phase begins upon System ‘Turn-Over’ with certification by the Contractor that the systems have been placed into service in accordance with the approved protocols and after the submission of the approved Start-Up Documentation. The Acceptance Phase ends with the successful completion of all Functional Performance Testing and sign-off by the CxA.

B. Action Item (AI): Any Cx-related issue that requires a response, completion, corrective or additional work, or any other action. Examples include a Request for Information (RFI), a work directive, a clarification request, a to-do item, an identified deficiency, or any other like item. Action Items must be categorized as appropriate.

C. Action List: This is a list that is maintained and updated by the CxA that includes all Action Items that relate to Cx activities.

D. A/E: General reference to the Architect/Engineer lead-design entity.

E. ASHRAE: American Society of Heating, Refrigerating, and Air Conditioning Engineers.

F. Basis of Design (BOD) Document: The Basis of Design document is developed by the design team, and shall respond to and be consistent with the performance criteria specified in the Owner’s Project Requirements. The BOD illustrates the means by which the OPR criteria are to be achieved, documenting the assumptions and parameters used in the design, and documenting the primary thought processes or decisions made that resulted in the selected alternatives. At the end of the project, the final BOD content may be incorporated into the Systems Manual if desired in part or in its entirety. The BOD is a required component for LEED-certified projects, and is recommended by ASHRAE for all projects subject to the Cx process.

G. Building Automation System (BAS): The computer-based control or automation system. BAS is used throughout these Sections. Alternate references common in the industry include facility management system, automatic temperature control system, direct digital control system, building management system, building management and control system, digital control system, Energy Management System, Energy Management and Control System or System Control and Data Acquisition (SCADA) System.

H. Checklist Item: An item to inspect to verify proper installation of equipment or systems by the Contractor. Checklist items simply require a ‘Yes/No’ or ‘OK/Not’ response. Start-Up Checklist items are one component of the Start-Up Documentation.

I. Commissioning (Cx): The process of ensuring that all building systems perform interactively according to the design intent, that the systems are efficient and cost effective, and that they meet the Owner’s operational needs.

J. Commissioning Authority (CxA): The Party retained by the Owner who will oversee and manage the Cx process, develop and stipulate many of the Cx requirements, and ensure and validate that systems and equipment are designed, installed and tested to meet the Owner’s requirements.

K. Commissioning Coordinator (CxC): This refers to the Individual within each of the various Parties that is designated the POC for that Party relative to Cx activities. Each of the Contractors subject to the Cx process should designate a CxC and make that person available to the CxA as the point-of-contact for that Contractor.

L. Cx Portal: See ‘Portal’ below.
M. Cx Record Matrix: The Cx Record Matrix provides an ongoing and updated status of the cx program as it is being executed. It is a table of all systems and equipment subject to the Cx process and the status and responsible party of Cx procedures relating to that equipment. Typical fields tracked include equipment tag, location, description, Start-Up Documentation status, FPT status, training status, status of submittals and record drawings, and final Cx disposition.

N. Commissioning Specifications: Generic reference to any of the Cx-specific specification Sections, as inferred by the usage. Divisions 01, 22, 23, 26, and others contain Sections that are specific to or reference the Cx process. All Contractor requirements relating to Cx should be conveyed within the Cx Specs. Cx Specs should be referenced but not duplicated within the Cx Plan (the Cx Plan is designed to govern non-Contractor-related Cx issues).

O. Commissioning Team: The group of Parties involved in the Cx process for any given system. The Cx Team will include a core group involved with all systems, consisting of the CxA and CxC members representing the CM and the Owner. On any given system, the Cx Team will additionally include the CxC’s for the Contractors responsible for the system or equipment.

P. Contractor: As used herein, ‘Contractor’ is a general reference to the installing Party and can therefore refer to the CM, subcontractors, or vendors as inferred by its usage.

Q. Construction Manager (CM): The Party acting as the primary coordinator of all the major subcontractors (MC, EC, TAB, BAC, etc.) as applicable.

R. Construction Phase: Phase of the project during which the facility is constructed and/or when systems and equipment are installed and started. Contractor and subcontractors complete the installation, complete Start-Up Documentation, submit O&M information, establish trends, and perform any other applicable requirements to make systems operational. Contractor and Vendors may also conduct ‘Equipment and Systems Training’ events during this phase. The Construction Phase concludes upon completed Start-Up and TAB of systems and equipment.

S. Contract Documents: The documents governing the responsibilities and relationships between Parties involved in the design and construction of this project including (but not necessarily limited to):
   1. Agreements/Contracts;
   2. Construction Plans and Drawings;
   3. Specifications;
   4. Addenda;
   5. Change Orders;
   6. Commissioning Plan (for reference only)

T. Construction Documents: Refers generally to the Contract Documents that dictate the details of the installation (all but item a. above).

U. Deficiency: A condition in the installation or function of a component, piece of equipment or system that is not in compliance with the Contract Documents, does not perform properly or is not complying with the design intent.

V. Design Engineer: Generic reference to the engineer-of-record or a specific engineering disciple as inferred by its usage.

W. Electrical Contractor (EC): Contractor generally responsible for Division 26 work.

X. Factory-Authorized Representative: An individual fully trained on the equipment and certified by the manufacturer to perform the respective task.
Y. Factory Testing: Testing of equipment off-site at the manufacturer’s facility. May be witnessed by the members of the project team.

Z. Functional Completion: A Cx program milestone that marks the successful completion of the FPTs by the CxA and therefore completion of the Acceptance Phase. {This also coincides with the project’s definition of Substantial Completion.} {Functional Completion is a prerequisite for Substantial Completion.}

AA. Functional Performance Tests/Testing (FPT): The detailed and thorough tests (and test procedure) developed and performed by the CxA to document proper operation of building systems and the components and equipment making up those systems during the Acceptance Phase. References made to FPT throughout the documents are inclusive of ISFPT unless specifically indicated otherwise.

BB. IAQ: Indoor Air Quality

CC. LEED (Leadership in Energy and Environmental Design): The LEED® Green Building Rating System is a voluntary, consensus-based rating system designed to encourage building owners to apply leading proven technologies for new construction. Areas of concentration include “Sustainable Sites”, “Water Efficiency”, “Energy and Atmosphere”, “Materials and Resources”, and “Indoor Environmental Quality”. Contractor activities from demolition to procurement to commissioning to waste handling can be impacted by the LEED program.

DD. Manufacturer’s Representative: Either an individual in direct employ of the manufacturer of the applicable system, or an individual who is certified by that manufacturer to perform the applicable work for which the reference is made. This is synonymous with Factory-Authorized Representative.

EE. Mechanical Contractor (MC): Contractor generally responsible for Division 22 and 23 work.

FF. O&M Documentation: Contractor-developed documentation designed to address the needs of facilities personnel and customized for the context of the specific facility and installation. The foundation of O&M Documentation is manufacturer’s literature (O&M Manuals), with additional Contractor-developed step-by-step instructions for manual start/stop, emergency procedures, operating sequences, preventative maintenance, and other installation-specific information. O&M Documentation content is indexed/organized by equipment-type. When a Systems Manual is being developed by the CxA, some of the Contractor-developed content will need to be made available to the CxA for inclusion into the Systems Manual.

GG. O&M Manuals: Generic reference to manufacturer-published O&M materials, which have no information specific to the facility, but may be edited or marked up to indicate specific equipment or systems installed. O&M Manuals include documents covering installation, operation, maintenance, troubleshooting guides, parts numbers, engineering and design parameters, applications manuals, and any/all information available from the manufacturer pertaining to the installed equipment or systems. Specifications should strive for this information to be submitted in electronic form whenever possible. The electronic versions of these documents can also be electronically edited to indicate equipment installed and to delete or mask-over equipment and content that is not installed on the project.

HH. Opposite Season: The season opposite that when the majority of the testing occurs.

II. Owner’s Project Requirements (OPR): The OPR is intended to provide the basis from which all design, construction, acceptance, and operational decisions are made. It details the functional requirements of the project, including systems subject to commissioning. The OPR defines the benchmarks and metrics by which the success of the project is ultimately judged, and evolves
through each project Phase. The OPR is typically developed early in the project cycle by the Owner and the A/E and provides the user needs, requirements, goals, and metrics that are defined by the Owner to be important. The OPR criteria are referenced by and should be the foundation of the BOD narrative. At the end of the project, content the final BOD may be incorporated into the Systems Manual. The OPR/BOD is a required component for LEED-certified projects, and is recommended for all projects subject to the Cx process.

JJ. Party: Entity (company, corporation, etc.) legally responsible for portion of work.

KK. Point-of-Contact (POC): General reference to a key individual within each Party.

LL. Portal: The Cx Portal ('Portal') is a Web-based Internet hub used to electronically collaborate and coordinate activities throughout the Cx process. The Portal is hosted by the CxA and is accessible by all Parties participating in the Cx program.

MM. Prefunctional: The term "Prefunctional" is synonymous with "Start-Up", but not used in these specifications. It is a modifier for checks, tests, and other activities that occur prior to and are prerequisites for Functional Performance Testing.

NN. Preliminary Service: Refers to initial operation of a system or piece of equipment to provide temporary service where initial Start-Up to determine safe operation has been performed. Final TAB and Functional Performance Testing proceeds while the system is in Preliminary Service.

OO. Pre-Test: Preliminary testing accomplished to verify system functionality prior to placing the system/equipment into Preliminary Service.

PP. Project Phases: Phases of the project include the Construction Phase, Acceptance Phase, Warranty Phase, and Occupancy. Earlier Phases include Program Phase and Design Phase.

QQ. RFI: Request for Information.

RR. Start-Up: Refers to the quality control procedures whereby the Contractor verifies the proper installation of a device or piece of equipment, executes the manufacturer's starting procedures, completes the 'Start-Up Checklist', energizes the device, verifies that it is in proper working order and ready for dynamic testing, and completes the 'Start-Up Tests'. Start-Up procedures are performed by the Contractor with or without a formal Cx process, although the documentation is more formalized when the Cx process is used.

SS. Start-Up Checklist: A list of items to inspect to verify proper installation of equipment or systems by the Contractor. Checklist items simply require a 'Yes/No' or 'OK/Not' response. These include primarily static inspections and procedures to prepare the equipment or system for initial operation (e.g., belt tension checked, oil levels OK, labels affixed, gages in place, sensors calibrated, etc.). Start-Up Checklist items are one component of the Start-Up Documentation (Start-Up Tests being the other).

TT. Start-Up Documentation: Refers to the combination of Start-Up Checklists + Start-Up Tests. The Contractor documents the Start-Up procedure by completing and submitting the Start-Up Documentation. Start-Up Documentation may be a combination of procedures prepared by the CxA, those included in the Contractors in-house quality assurance process, and those required by the manufacturer. Regardless of the context of the checklist or format of the form used to documents it, the reference to 'Start-Up Documentation' includes all of the stated checklists and tests.

UU. Start-Up Test: This is a quality-assurance test that is required to ensure the system is ready to be placed into service. It differs from a checklist item in that it requires more than a binary
(yes/no, OK/Not OK) response - an observation, measurement, or sequence of events must be documented. Start-Up Tests are one component of the Start-Up Documentation (Start-Up Checklists being the other).

VV. Substantial Completion: Milestone as defined in the Owner-Contractor agreement and Specifications. This milestone will coincide with the end of the Acceptance Period. This milestone also coincides with the start of the Warranty Period.

WW. System Turn-Over Meeting (“Turn-Over”): Turn-Over is a quality control milestone in which all Contractors responsible for completing the installation and start-up of a system or equipment, along with the DM and CM, meet to validate that the system or equipment is completed and operational per the contract documents and ready for Functional Performance Testing, and that all the Start-Up Documentation and nameplate data is complete and accurate. The CxA will in many cases participate in this. CM shall organize and lead the process in all cases.

XX. Systems Manual: The Systems Manual is the final deliverable from the Cx process, and provides the information needed to understand, operate, and maintain the facility and its systems. It is typically developed by the CxA or A/E, but with content required to be provided by the design team and the Contractors. The Systems Manual expands the scope of standard O&M documentation to incorporate additional information developed through the Cx process. The Systems Manual should be the repository of all updates and corrections as they occur (even throughout Occupancy). It is narrative in nature and organized by system types and by area/usage of the facility (if applicable). Systems Manual content typically includes narrative descriptions of the facility and systems, sequences of operation, schematic diagrams, cuts from design drawings and equipment literature, photos, and manual start/stop and emergency operating procedures for important equipment. The content of the Systems Manual is dictated by budget, and usually consists of a single narrative document with references to and inclusive of the entire set of O&M and Training materials.

YY. Test: A task, procedure or measurement that confirms capacity, functionality, accuracy, etc. Tests have a status of “Pass”, “Fail”, “Couldn’t Test” or “Didn’t Test”. May refer to Start-Up or Functional Performance Tests.

ZZ. TAB: Can refer to the test, adjust, and balance process or the Testing, Adjusting, and Balancing Contractor as inferred by its usage.

AAA. Temporary Conditioning Plan: A plan that summarizes the logistics, procedures and protocols for taking permanent equipment and using it to maintain conditions throughout construction. The Temporary Conditioning Plan must be approved by all members of the Cx Team prior to placing equipment into temporary service.

BBB. Testing Agency: An independent agency typically retained by the Contractor to perform specialized testing of systems or equipment (most commonly electrical). The Testing Agency shall be qualified and equipped to perform the testing and shall submit appropriate qualifications.

CCC. Trending: Monitoring and recording a history of parameters typically using the building automation system.

DDD. Turn-Over: See “System Turn-Over Meeting” above.

EEE. Vendor: Refers to the organization that sold a system or equipment to the subcontractor. This may be a branch office of the manufacturer or a value-added reseller.
FFF. Warranty Period: The period defined by the construction documents where elements of the facility are under contractual warranty.

GGG. Warranty Phase: Includes the early occupancy of the building and can continue through the contractual Warranty Period and at least into the opposite season from when the facility systems were initially tested.

1.7 DOCUMENTATION

A. Contractor shall provide the following documentation to the CxA per the procedures specified herein and in other Sections of the specification:

1. Shop Drawings and Product Data: CxA shall be provided shop drawings and submittal data for systems and equipment that will be part of the Cx process. Some of these submittals will be reviewed by the CxA and others are only needed for record. CxA will mark up the Submittal Register to indicate the documents required. Electronic format shall be in PDF format and shall be capable of allowing electronic comments and markups.
   a. Submittals to be Reviewed: CM shall provide the CxA one electronic copy of Shop Drawings and Product Data concurrent with distribution to the A/E. CxA shall review and incorporate comments via the A/E. CM shall then copy CxA with the final reviewed submittal with A/E approval stamp.
   b. Submittals for Record: CM shall provide to the CxA the final electronic record copy of the submittal.

2. Draft Start-Up Documentation: Contractor shall develop Start-up Documentation for all applicable equipment and systems along with the manufacturer’s application, installation and recommended start-up procedures. CxA will initially provide to the Contractor generic Start-up Checklists, the content of which must be reviewed by the Contractor and supplemented with manufacturer-specific requirements and the Contractor’s own internal quality assurance procedures and checks. CxA will review draft and recommend approval.

3. Factory Test Reports: Contractor shall provide any factory testing documentation or certified test reports required by the specifications. These shall be provided prior to Acceptance Phase.

4. Schedule Updates: Issue periodic updates to the construction schedule as specified. Provide electronic copy of each update to the CxA. Contractor shall use schedule updates to notify Cx Team of scheduled start-up and training activities.

5. Temporary Operating and Conditioning Plan: Contractor shall provide initial Temporary Operating and Conditioning Plan for approval and then issue periodic updates to reflect actual conditions. At the completion of the temporary conditioning period, the final plan shall be submitted with completed maintenance records, inspection and check logs, operating logs, and narrative of any problems or issues that occurred during Temporary Conditioning (if applicable).
6. Piping Cleaning, Flush, and Fill Plan: Contractor shall provide Piping Cleaning, Flush, and Fill Plan for approval at least 30 days prior to final cleaning, flush, and fill.

7. Action Item Response: Respond to Action Items to which the CxA assigns responsibility to the Contractor.

8. Field Testing Agency Reports. Provide all documentation of work of independent testing agencies required by the specification. These shall be provided prior to Acceptance Phase.

9. Completed Start-Up Documentation: Provide completed Start-Up Documentation for all applicable equipment and systems. Provide prior to the start of the Acceptance Phase. CxA will review prior to FPT. Completed Start-Up Documentation shall be entered by the Contractor on the Portal.

10. Nameplate Data Documentation: Provide prior to the start of the Acceptance Phase. Completed nameplate data shall be entered by the Contractor on the Portal.

11. Equipment Warrantees: Provide prior to the start of the Acceptance Phase.

12. Training Plan: Provide prior to the start of the Acceptance Phase.

13. Record Training Documentation: Provide at least 7 days prior to the start of the applicable training session. The compiled and final record training documentation will be provided by the CM within 14 days of the last training session provided under the construction contract (this will typically be the site-specific controls training). This will take the form of the Training Plan supplemented with evaluations and actual dates and topics.

14. O&M Documentation Content: Provide O&M Documentation content (including installation-specific instructions) to the CxA for incorporation into the Systems Manual per the requirements of this Section, and Division 01 requirements. Submit at least one month prior to the beginning of the Acceptance Phase.

B. Record Drawings: Contractor shall maintain an updated set of record or ‘As-Built’ documents at the jobsite and electronically online reflecting actual installed conditions and all approved changes and modifications to the contract documents. Contractor shall provide access to the CxA to review the As-Built and Record Drawings. Provide Record Drawings in accordance with Division 01.

1.8 COMMISSIONING SEQUENCING AND SCHEDULING

A. Refer to the sequencing illustration at the end of this Section for a conceptual graphical representation of the precedents related to the Cx tasks. These precedents are generally to be applied per system and/or per area. Where applicable, in order to expedite the closeout of the facility, various systems can be in various stages of the Cx process. CxA and Contractor shall cooperate to schedule the Cx tasks to minimize the duration of the Cx activities.

B. The Cx process will be categorized into Phases as indicated below and defined under the definitions paragraph above. Note that per schedule, different systems and/or areas may be in different phases at any given time given that the Cx program will be integrated into the construction process:
   1. Construction Phase
   2. Acceptance Phase
   3. Warranty Period

C. CxA will provide a more detailed precedent diagram in Gantt chart format for direction of Cx precedents and task duration.

D. Prior to submission of the baseline schedule, the scheduler will coordinate with the CxA to specifically include the detailed tasks involved in the Cx process. CxA will provide an initial “Precedent Diagram” that outlines the optimal Cx process. Scheduler shall meet with the CxA and the subcontractors to synthesize the Precedent Diagram with the general construction
process constraints and integrate the agreed upon process into the main construction schedule. Commissioning-related tasks shall be coded as such to facilitate generating a Cx fragment that will be used during Cx progress meetings.

E. The Cx precedent schedule will outline generic Cx tasks with precedents or prerequisites to each task. These tasks, which will be shown generically for typical systems, will apply to many systems. Contractor shall incorporate the tasks into EACH SYSTEM. This will require a detailed track for each system and as such the scheduler must schedule and code by system as well as by area. The Cx precedent diagram will also indicate system precedent requirements for start-up and Functional Performance Testing. Contractor shall collaborate with the CxA to determine impacts of project phasing as applicable. Examples of enumerated tasks include:

1. Contractor preparation of draft Start-Up Documentation;
2. Contractor preparation of Training Plan;
3. Preparation of O&M Documentation content and other content for the Systems Manual;
4. Testing Agency activities;
5. Electrical Start-Up by system and zone group;
6. Mechanical Start-Up by system and zone group;
7. BAS Start-Up by system and zone group;
8. TAB by system and zone group;
9. Training Events;
10. Functional Performance Testing by system and zone group.

F. Contractor shall completely install; thoroughly inspect; start-up; and test, adjust, and balance systems and equipment. All activities shall be documented per specified procedures and progress tracked on the construction schedule.

G. Contractor shall notify CxA at least 14 days in advance for all system and equipment Start-Ups, training, pressure tests, or system flush and fill. At their discretion, the CxA shall witness selected Start-Ups, training events, or tests. Notification shall be accompanied by a schedule showing the coordinated start date and task duration and all currently open precedent requirements.

H. CM shall schedule and conduct System Turn-Over Meetings for all systems and equipment in the Cx scope as specified below. CM shall notify CxA, DM, A/E, and Owner in writing that systems are complete and ready for verification and Functional Performance Testing.

I. Notification of utility or system outages affecting current mission shall require advance notification per applicable Division 01 section.

1.9 SYSTEM TURN-OVER MEETINGS ('TURN-OVER')

A. CM shall schedule and conduct System Turn-Over Meetings ('Turn-Over') for all systems and equipment. Turn-Over is a quality control milestone in which all Contractors responsible for completing the installation and start-up of a system or equipment, along with the DM and CM, meet to validate that the system or equipment is completed and operational per the contract documents and ready for Functional Performance Testing, and that all the Start-Up Documentation and nameplate data has been completed and is accurate. The CxA will in many cases participate in this. CM shall organize and lead the process in all cases.

B. Notification shall be given of all System Turn-Over Meetings to the CxA and the Owner via an Action Item posted on the Portal at least 14 days in advance of the activity. CxA and Owner may elect to witness the Turn-Over, although it is not required. Primary responsibility of confirmation of the represented state of the equipment lies with the CM.
1.10 ELECTRONIC RECORD SUBMITTALS

A. Contractor shall submit a final electronic version of the submittal for Owner’s future asset management within 14 calendar days after receipt of approval from the Owner and the Architect on any submittal for equipment in Divisions 22, 23, 25, and 26.

B. Final Electronic Record Submittals shall:
1. Be originally authored in electronic media and not scanned versions with hand mark-ups unless specifically approved otherwise.
2. Be provided in Portable Document Format (*.pdf) with selectable text and graphics that are readable. The documents shall be merged into one bookmarked document up to 500 MB. Merged documents shall use hierarchical bookmarks to form a table of contents and provide hyperlinks to the subject topic. For submittals larger than 500 MB, provide a summary document in PDF or HTML format with relative hyperlinks to the associated document files within the same directory or in directories subordinate to the summary document.
3. Include all final ratings, parameters, specifications, options, etc. In the case where the Architect returns the submittal “Approved As Noted, Resubmission Not Required” and includes mark-ups or comments that change the originally submitted ratings, parameters, specifications, options, etc., the Contractor shall correct the documents in the original electronic document prior to submitting the final electronic documents.
4. Highlight the specific rating, parameter, specification, option, etc. when the original document includes multiple alternatives. For instance, when a range of performance parameters are given or various sizes are shown, or various options are listed, the applicable item shall be indicated by highlight, circle, pointer, or other electronic marking. Partial-page material in the submittal that does not pertain to the project can be masked with a transparent gray screen over the text; entire pages that are not applicable may be electronically deleted.
5. Do not include generalized direction from the Architect that does not relate to ordering and purchasing the equipment. For instance, notes such as “Coordinate with mechanical engineer for final motor horsepower” are not to be transferred to the electronic submittal. In that example, only the final coordinated sizes shall be indicated.

C. Final Electronic Record Submittals shall be either posted to the project web site or provided on compact disc.

1.11 COORDINATION MANAGEMENT PROTOCOLS RELATIVE TO COMMISSIONING

A. Coordination responsibilities and management protocols relative to Cx are initially defined below but will be refined and documented in the Construction Phase Cx Kick Off meeting. Contractor shall have input in the protocols and all Parties will commit to process and scheduling obligations. The CxA will record and distribute.
1. Submittals and Shop Drawings: CM shall distribute these to the CxA. CxA shall edit the project’s submittal log to communicate which submittals must be forwarded to CxA.
2. CxA Review Comments on Shop Drawings: Comments shall be posted on the Portal and a copy sent directly to the A/E and CM by the CxA. A/E shall consider and incorporate at their discretion.
3. Deficiencies Identified by the CxA: When the CxA identifies a deficiency, CxA shall make a good faith assessment of responsible parties. Those parties, as well as CM shall be notified of the perceived deficiency. This communication is FOR INFORMATION ONLY and is not a directive to any party to resolve the deficiency. Contractor may accept responsibility and resolve the deficiency voluntarily. If Contractor contests either the deficiency or responsibility for that deficiency, Contractor shall respond to that deficiency indicating disagreement. If responsibility is not agreed to via the Cx dialogue, PSU shall issue a work directive or RFI via the normal contractual channels to resolve the issue.
4. Requests for Meetings: Request by the Contractor for a meeting with the CxA shall be routed through CM who will then determine the validity. Note that every attempt should be made to deal with Cx issues at regularly scheduled Cx Meetings.

5. Control Sequence Modifications: CxA shall make every attempt to thoroughly review the sequences during the submittal phase and address any issues prior to the submittal approval. However, CxA and the BAC may incorporate minor changes to the sequence during testing when it is apparent that it improves the control of the equipment but does not fundamentally change the sequence. The time required by the BAC for this type of modification is addressed in Section 23 08 00. Any and all changes must be thoroughly documented in the record documents.

6. Scheduling Coordination: CxA shall consult directly with the CM to incorporate the Cx tasks in the project schedule. The process logic and integration shall ultimately be a collaboration between CM, CxA, and subcontractors. The effort will start with CxA and CM proposing initial logic. Then subcontractors will join the discussion and work out the final details, (precedent logic and durations).

7. Notification of Completion Milestones: Contractor shall notify CM at least two weeks prior to an anticipated Cx activity or milestone (such as Turn-Over). CM shall then coordinate the scheduling of the activity (as applicable) between all required parties as applicable. Notification shall be posted using the Portal (events module) with an associated Action Item distributed to interested parties.

8. Action List: CxA maintains a categorized Action List which tracks the Cx-related action items. All content of the Action List will be available to all parties who have credentials on the Portal. Any party with credentials may post an Action Item. Any party that is copied on an email resulting from an Action Item posting may respond to it and contribute to the dialogue.

9. Start-Up Checklist and Test Documents: CxA will provide initial 'generic' Start-Up Documents to the Contractor. The Contractor shall synthesize these with the manufacturer-specific start-up procedures and submit both to the CxA for review and approval. The Contractor has the option of modifying the supplied generic procedures in the delivered format, or by supplementing these with their own procedures. The Contractor then executes, signs, and submits the final reviewed and approved Start-Up Documentation. The CxA subsequently (and optionally) spot-checks the procedures and documentation at the ‘System Turn-Over Meeting’. The Start-Up Documentation is then included in the Commissioning Record.

10. Functional Performance Test Documents: Functional Performance Tests are prepared and completed by the CxA. They are developed during the construction phase, typically after completed submittals. CxA forwards the FPT procedures to the CM to be subsequently distributed to the Contractors for review. Contractors approve the procedures. Throughout the Cx process, CxA maintains a current record of the FPTs and their results and keeps the documentation up to date and accessible for all to access the current progress. CxA distributes hard copies of the FPTs at the completion of any significant stage of commissioning.

1.12 CONTRACTOR RESPONSIBILITIES

A. Construction Phase: The following delineates the commissioning-related responsibilities of the Contractor (and their subcontractors) during the Construction Phase.

1. Include Cx requirements in price and plan for work.

2. Designate a Commissioning Coordinator (CxC) from each major subcontractor with activities related to commissioning. These Commissioning Coordinators are to be the primary contacts for Cx activities.

3. Attend Construction Phase Cx Kick Off Meeting. The CxC and Project Manager from each major subcontractor shall attend.

4. The CxC’s shall attend all Cx progress meetings unless otherwise agreed to by the CxA.

5. Remedy any deficiencies identified throughout construction.

6. TAB shall submit sample balancing forms for approval prior to starting work.
7. Schedule and coordinate Cx efforts into the construction schedule. Incorporate the precedent diagram provided by the CxA into the construction schedule. Indicate at a minimum all tasks enumerated on the precedent diagram for all systems.

8. Coordinate the work of subcontractors, vendors, manufacturers, and Testing Agencies provided with the bid, and ensure that they are informed of and are adhering to the requirements of the Cx process specified throughout the contract documents.

9. Contractor-Developed Documentation: Contractor shall develop and submit the following information as specified:
   a. Draft Start-Up Documentation (submit along with the manufacturer's application, installation and start-up procedures);
   b. O&M Documentation content as specified;
   c. Systems Manual content as specified;
   d. Training Plan, and materials and documentation of training;
   e. Temporary Operating and Conditioning Plan, if applicable, content as specified;
   f. Piping Cleaning, Flush, and Fill Plan, content as specified;
   g. Comprehensive integrated procedures for scheduling and task notification and documenting them in a common format.

10. Provide assistance to the CxA in preparation of the specific Functional Performance Test (FPT) procedures. Contractors, subcontractors and vendors shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests. Damage caused to equipment performed in accordance with the approved procedures will be the responsibility of the Contractor.

11. Thoroughly complete and inspect installation of systems and equipment as detailed throughout Contract Documents, as required by reference or industry standards, and as specifically indicated elsewhere this Section.

12. Start-up, test, adjust, and balance systems and equipment prior to verification and Functional Performance Testing by the CxA. Start-Up Documentation shall be in accordance with Contract Documents, reference or industry standards, and specifically individual Cx specifications. Provide skilled technicians qualified to do the work required. Provide factory trained/authorized technicians where required by the contract documents and stated in the applicable technical section. Start-Up and Functional Performance Testing shall proceed from device checkout, to component checkout, to system checkout, to inter-system checkout.

13. Prepare spaces with adequate security for on-site contractors to store equipment. Provide secure space with 120 volt AC power for the CxA, TAB, and BAC to base their operations and store test equipment, drawings, files, and the like.

14. Schedule for any required representative space mock-ups as early as possible to facilitate determining standards for closeout.

15. Record Start-Up procedures on approved Start-Up Documentation and certify that the systems and equipment have been started and or tested in accordance with the requirements specified above. Each task or item shall be indicated with the party actually performing the task or procedure.

16. Provide skilled technicians qualified to perform the work required.

17. Provide factory-trained and authorized technicians where required by the Contract Documents.

18. Tag equipment that is started with the Individual’s name and date.

19. Demonstrate the operation of all systems as specified.

20. Certify that systems have been installed and are operating per Contract Documents prior to Functional Performance Testing.

21. Maintain an updated set of Record Documentation as required by the Contract Documents.

22. Copy the CxA on indicated documentation.

23. Conduct and document Equipment and Systems Training events as required by this Section and by applicable sections of the Specifications pertaining to each piece of equipment or system.
B. Acceptance Phase: The following delineates the Cx-related responsibilities of the Contractor (and their subcontractors) during the Acceptance Phase.
1. Assist CxA in Functional Performance Testing. Assistance will generally include the following:
   a. Manipulate systems, equipment, BAS, and other control systems to facilitate testing (as dictated in Section 01 91 10; in most cases this will entail only an initial sample).
   b. Provide any specialized instrumentation necessary for Functional Performance Testing.
2. Correct any work not in accordance with Contract Documents.
3. Participate in Training Events relative to use of O&M information and the preventative maintenance program.
4. Maintain record documentation, and update and resubmit it when Acceptance Phase is completed.
5. Compensate CxA for additional site time incurred due to incompleteness of systems or equipment at time of Functional Performance Testing.

C. Warranty Phase: The following delineates the Cx-related responsibilities of the Contractor (and their subcontractors) during the Warranty Phase.
1. Provide warranty service;
2. Conduct Final Systems Operation Training (BAC lead);
3. Respond to and document warranty issues;
4. Participate as required in opposite season testing;
5. Correct any deficiencies identified throughout the Warranty Phase;
6. Update record documentation to reflect any changes made throughout the Warranty Phase and resubmit final Record Drawings at the close of the Warranty Phase.

1.13 EQUIPMENT SUPPLIER/VENDOR RESPONSIBILITIES

A. Construction Phase: The following delineates the Cx-related responsibilities of the Equipment Supplier (and their subcontractors) during the Construction Phase.
1. Provide shop drawings and product data in hard copy and electronic format.
2. Provide manufacturer’s application, installation and start-up instructions within 30 days of shop drawing/product data approval.
3. Where factory-authorized start-up is specified, coordinate and participate in the specified Cx process and document start-up on the appropriate forms.
4. Review and approve Functional Performance Test procedures affecting supplied equipment.
5. Where training is to be provided by factory-authorized personnel, provide required Training Plan information including course content for approval prior to conducting the training.
6. Conduct and document Equipment and Systems Training events as required by this Section and Section 01 82 00, and by applicable sections of the Specifications pertaining to each piece of equipment or system.
7. Provide spare parts and materials as required by the specifications.
8. Provide special tools as required by the specifications.
9. Provide Systems Manual content as required and develop project-specific O&M content as required by the Cx requirements.
10. Provide all warranties.

B. Acceptance Phase: The following delineates the Cx-related responsibilities of the Equipment Supplier (and their subcontractors) during the Acceptance Phase.
1. Participate in any Functional Performance Testing required.
2. Consult on issues identified relative to the supplied equipment.
C. Warranty Phase: The following delineates the Cx-related responsibilities of the Equipment Supplier (and their subcontractors) during the Warranty Phase.
   1. Provide any warranty service required to the supplied equipment as applicable with the agreement with the Contractor.
   3. Provide technical support to the Owner’s facilities personnel.

1.14 COMMISSIONING KICK OFF/COORDINATION MEETING

A. CxA shall schedule and conduct a Cx coordination meeting near the beginning of construction. The following should be discussed at this meeting:
   1. The commissioning documents (specifications and Cx Plan);
   2. Requirements and sequence of commissioning;
   3. Responsibilities of the construction parties;
   4. Management protocols;
   5. Required submittals;
   6. Schedule

1.15 START-UP DOCUMENTATION AND START-UP PROCESS

A. Purpose: The Cx process requires that the normal quality control processes involved with preparing systems and equipment for operation are performed to a high standard of care and are thoroughly documented. The required Cx-related Start-Up Documentation involves nothing additional than that which would be done for any good installation. These procedures shall be performed to all installed systems and equipment and no sampling strategy is used for the Start-Up process. The Cx process requires all Parties to collaborate to establish the optimal standard of care for starting systems and equipment. After the procedures are established, the Contractor performs them and documents them with the Start-Up Documentation that is developed by the joint effort of the Contractor and the CxA.

B. Creation of Start-Up Documentation: Start-Up Documentation (consisting of checklists and tests as defined above) shall be developed by the Contractor and appropriate manufacturers for each type of equipment and system being installed for this project. It shall be submitted to the CxA for approval prior to actual equipment Start-Up. Contractor shall develop Start-Up Documentation based upon a combination of the ‘generic’ procedures prepared by the CxA (see below): existing procedures and checklists included in the Contractors in-house quality assurance process, and those procedures required by the manufacturer. Contractor shall provide the CxA with either 4 hard copies or one electronic copy of manufacturer’s application, installation and start-up information at the time they submit the Start-Up Documentation. The CxA shall then approve the Start-Up Documentation. Approved Start-Up Documentation shall reflect all project-specific values, settings, targets, acceptance criteria, and other parameters as appropriate. Final approved Start-Up Documentation shall be entered on to the Portal by the [CxA] [CM] [Contractor].

C. ‘Generic’ Start-Up Documentation: Refer to Sections 23 08 00 and 26 08 00 for ‘generic’ Start-Up Documentation for a variety of HVAC, mechanical and electrical systems. The content of the ‘generic’ Start-Up Documentation shall provide the minimally acceptable content. Generic refers to the fact that these procedures and protocols are common for most types of equipment and systems across different manufacturers. The Contractor is responsible for customizing this material to reflect the actual equipment and systems selected.

D. Manufacturer/Vendor Installation and Start-Up Documentation: Contractor and Vendors shall provide manufacturer’s preprinted and standard installation checklists, forms, and protocols both for review early in the construction process and to as required to document the Start-Up process towards the end of the Construction Phase. After the approval of the shop drawings
and product data, Contractor shall submit manufacturer’s start-up procedures and application
guidelines for all systems, equipment, and components. These shall be submitted in electronic
PDF format for review and approval. Submittal of the information shall be within 30 days of the
submittal approval.

E. Content of Start-Up Documentation: Start-Up Documentation shall generally include the
following for each item of equipment or system (as applicable):
1. Project-specific designation, location and service;
2. Indication of the Party performing and documenting the Start-Up;
3. Clear explanation of the inspection, test, measurement, and outcome with a Pass/Fail
indication and a record of measured parameters (as applicable);
4. Include a checklist item indicating that all O&M Documentation, Warranties, and Record
Documents have been completed and submitted;
5. Include a Start-up Checklist item indicating that proper maintenance clearances have
been maintained;
6. Include a Start-up Checklist item indicating that special tools and/or spare tools required
for normal operation and maintenance were turned over to the Owner;
7. Include Start-up Checklist item indicating that all required dependent or prerequisite
equipment and systems were previously started successfully.

F. Manufacturer’s Requirements: Start-Up Documentation shall incorporate all manufacturer-
specified procedures. As applicable, include acceptance criteria specified therein. The
manufacturer’s start-up and checkout procedures shall be submitted to the CxA along with the
Contractor’s draft Start-Up Documentation.

G. Recording and Documentation of the Start-Up: Manufacturer’s start-up protocols shall be
executed and forms shall be completed by a qualified/authorized technician. These shall be
developed and submitted electronically or at the discretion of the CxA they may be scanned and
submitted electronically. Electronic documentation of manufacturer’s start-up protocols shall be
linked into the applicable test on the Portal.

H. Recording and Completion of Start-Up Checklists and Tests: A qualified technician from the
responsible installing Contractor or manufacturer’s start-up technician shall document the Start-
Up on the approved Start-Up Documentation forms. The individuals executing the Start-Up
shall acknowledge acceptability of each item with the indication of who performed the
associated task. The Start-Up is not considered complete until the Start-Up Documentation has
been completed and entered electronically on the Portal. Information documented manually on
paper in the field and/or installation or start-up information developed by the manufacturer must
be transferred to the electronic file before Turn-Over can be scheduled. The completed
documentation shall be presented and reviewed at the System Turn-Over Meeting.

I. CxA Review: CxA shall review the completed and submitted Start-Up Documentation and
request any incomplete data or additional information required to meet the Cx program criteria.
CxA will also review and spot-check procedures during Functional Performance Testing.

J. Systems Subject to Start-Up Documentation and Turn-Over: All (100% of) systems shall
undergo a documented Start-Up per the approved procedures and NO sampling strategy is
used. Completed Start-Up Documentation for all pieces of equipment shall be submitted to CxA
prior to Turn-Over or any associated Functional Performance Testing. Any outstanding item
shall be clearly indicated and an associated Action Item must be entered to track resolution.

K. Owner Access: Contractor shall allow access by Owner representatives at any time to inspect
the equipment and ensure its proper operation. Owner will be allowed to affix service tags to
equipment to track the proper maintenance.
1.16 MECHANICAL-SPECIFIC DOCUMENTATION REQUIREMENTS

A. The Division 23 Contractor shall provide the following documents as specified in Section 23 08 00:
1. Piping Cleaning, Flush, and Fill Plan
2. Temporary Operation and Conditioning Plan (if permanent systems are to be used to condition the building during Construction Phase)

1.17 EQUIPMENT NAMEPLATE DATA

A. Contractor shall provide as-installed specific product nameplate data, product numbers, serial numbers, and other information required to fully define the asset for Owner’s use in maintenance management and asset tracking. This data shall be provided electronically to ease in the data transfer to the computerized maintenance management system.

1. Acceptable forms of electronic submittals are:
   a. Microsoft Excel spreadsheet arranged with a separate ‘Sheet’ for each type of equipment and with individual pieces of equipment entered as rows and the applicable values to be recorded as column headings.

2. Minimum nameplate data content shall include the following as applicable:
   a. Construction document designation;
   b. Owner’s designation if different than the construction document designation and if provided by the Owner;
   c. Contact information identification which shall reference the project’s Contact List for installing contractor, vendor or representative, and manufacturer. Contractor shall also provide identification for suppliers of parts if different from the previous parties.
   d. Model Number;
   e. Serial Number;
   f. Date of Manufacture;
   g. All performance and sizing data required to operate, diagnose, or replace the system, equipment, component or systems with as a minimum that indicated in the construction documents.
   h. General description or type classification of the system, equipment, component, or device.

B. Contractor shall provide Equipment Nameplate Data for all equipment provided as work of this Division.

1.18 FUNCTIONAL PERFORMANCE TESTING

A. The objective of Functional Performance Testing is to demonstrate that each system is operating according to the documented OPR/Basis of Design and Contract Documents. Functional Performance Testing facilitates bringing the systems from completed Start-Up to Functional Completion. During the FPT, areas of deficient performance are identified and corrected, improving the operation and functioning of the systems. System parameters are further tuned and optimized to provide for stable control and interrelated system effects are also addressed.

B. The logistics and procedures involved in Functional Performance Testing are outlined below and in Section 01 91 10.

1.19 DEFICIENCIES IDENTIFIED DURING FUNCTIONAL TESTING

A. Non-Conformance Deficiencies. Non-conformance deficiencies identified during Functional Performance Testing shall be resolved as follows:
1. The CxA will record the results of the functional test in the project database on the Portal. All deficiencies or non-conformance issues shall be noted as Action Items and reported to the CM.

2. Corrections of identified minor deficiencies may be made during the tests at the discretion of the CxA. In such cases, both the deficiency and associated resolution will be documented in the database.

3. Every effort will be made by the CxA to expedite the FPT process and minimize unnecessary delays, while not compromising the integrity of the procedures.

4. As tests progress and a deficiency is identified, the CxA will discuss the issue with the executing Contractor.
   a. When there is no dispute on the deficiency and the Contractor accepts responsibility to correct it:
      1) The CxA shall document the deficiency along with the Contractor’s response and intentions, and then proceed forward to another test. A copy/email of the deficiency shall be generated and provided to the Contractor and CxA. The Contractor shall then correct the deficiency, complete the Action Item response certifying that the issue is resolved and/or the equipment is ready to be retested, and sends it back to the CxA.
      2) The CxA reschedules the test and the test is repeated until satisfactory performance is achieved. CxA then closes the Action Item.
   b. If there is a dispute about a deficiency, regarding whether it is a deficiency and/or who is responsible:
      1) The deficiency shall be documented as an Action Item with the Contractor’s response and the CM will be notified. The CM will track this issue under the construction contract dispute resolution provisions.
      2) Final interpretive authority is with the A/E. Final acceptance authority is with PSU.
      3) The CxA documents the resolution to the Action Item.
      4) Once the interpretation and resolution have been decided, the appropriate party corrects the deficiency, and responds to the Action Item indicating completion. The CxA reschedules the test and the test is repeated until satisfactory performance is achieved. CxA then closes the Action Item.

B. Cost of Retesting: The cost for the CxA to retest a Start-Up or Functional Performance Test shall be paid by the Contractor responsible for the deficiency. PSU shall pay the CxA directly and back charge the responsible Contractor.

C. Failure Due to Manufacturer’s Defects. If 10% or three, whichever is greater, of identical pieces of equipment fail to perform to the required Contract Document criteria (mechanically or substantively) due to manufacturing defect, all identical units may be considered unacceptable by the Owner. (For the purposes of defining ‘identical equipment’ for this Section, size or capacity alone does not constitute a difference.) In case of failure due to manufacturer’s defects, the Contractor shall provide the Owner with the following:
1. Manufacturer’s response in writing as to the cause of the failure and proposed resolution.
2. Manufacturer shall implement their proposed resolution on a representative sample of the product.
3. PSU will determine whether a replacement of all identical units or a repair is acceptable.
4. Upon acceptance, the manufacturer shall replace or repair all identical items at their expense and shall extend the warranty accordingly (if the original equipment warranty had begun).
5. Manufacturer or Contractor shall pay the costs of all retesting necessitated by the failure.

1.20 OBSERVATION PERIOD FOR BAS STABILITY

A. General: The Observation Period is defined as the period of time either prior to or immediately following Functional Performance Testing where the BAS is shown to operate properly without
malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications.

B. Prerequisites: The CxA will determine when the BAS has been substantially completed to allow for the start of an informal Observation Period as defined above. Observation Period may be witnessed in phases only on larger more complex projects where interdependencies between phases are not a factor.

1.21 TRAINING EVENTS

A. General: Adequate and thorough training of the Operators and the facilities staff is vital to effective transition and early occupancy of the building. A key goal of the Cx program is to ensure that this is accomplished. Contractors, subcontractors, and Manufacturers/Vendors as specified shall prepare and conduct training sessions on the installed systems and equipment for which they are responsible. The Contractor shall be responsible for insuring all training is performed in accordance with the Contract Documents.

B. Training Events Overview. Training Events include all classroom and field-based training sessions that result in the training or transference of design team or Contractor knowledge to the Owner. The following Training Events shall be executed as part of the Training Program:

1. Design Orientation Training: The purpose of the one-time Design Orientation Training event is to acquaint the Owner and Contractors with the facility design strategies and approach taken by the Design Team. The mechanical design engineer is responsible for conducting and documenting this training, with assistance and support from the CxA. Material from the Owner’s Project Requirements and Basis of Design Documents shall be covered during this training. An overview of the facility and its systems, the system design goals and the reasoning behind the selection of the equipment will be reviewed. The CxA will also review the upcoming Start-Up process and FPT/Acceptance Testing procedures. An optional tour will be provided at the conclusion of the event.

2. Equipment and Systems Training: The Contractor (or Manufacturer’s Representative) shall provide training to the Owner/Operators on individual systems and equipment only after successful Start-Up. These training events cover proper operation, maintenance, repair, and diagnosis of the systems, equipment, and components installed by the Contractor. Details and required content are provided elsewhere in this Section.

3. Final Systems Operation Training: The BAC shall provide this training to the Owner and Operators on whole-building operation. This training shall focus primarily on BAS control of building systems and operation and its impact on building performance, and shall be conducted after Functional Completion.

C. Training Means, Methods, and Documentation: The Contractor must document all training sessions. Details on the means and methods for conducting and documenting training, including location requirements, preparation, methods for presentation, scheduling, instructor qualifications, and other details are specified below.

1. Setting: Training sessions should typically start and end in a classroom setting. Field demonstrations shall be conducted to demonstrate the hands-on aspects of the required tasks.

2. Presentation: Training shall include electronic presentation materials. Presentation materials shall be submitted by the Contractor with the Training Plan. Contractor shall provide audio/visual equipment as required to communicate to a minimum of 10 attendees.

3. Documentation: Subcontractors or Vendors must document the training sessions in a Training Record. Beyond that included in the Training Plan, documentation shall include the names of the attendees and their evaluations. Training shall follow handouts that list the key points in bullet form presentation style or follow detailed written documentation. Training will not be approved unless it contains accompanying handout documentation to every attendee for their own use and record, separate from the master copy for the
4. Evaluations: All training sessions must be evaluated by the participants. CxA shall develop an evaluation form that assesses the quality of the presentation, the quality of the content, and provides a forum for feedback of items the attendee feels should be provided or expanded on. The Contractor that organizes the sessions is responsible for distributing the evaluations, ensuring they are completed, and compiling them and forwarding them to the CxA.

D. Training Plan Document
1. The Training Plan shall outline the various Equipment and Systems Training events and Final Systems Operation Training event as proposed by the Contractors, and shall be approved by the CxA. Contractor shall compile the individual training agendas of the subcontractors and vendors and submit a comprehensive Training Plan to the CxA, Architect and the Owner for review. Training Plan shall summarize all Equipment and Systems Training events with topics to be covered and approximate training duration.
2. The Training Plan shall include at a minimum:
   a. Topic and applicable specification section;
   b. Scheduled date(s) for the Events(s);
   c. Location and setting (classroom or field);
   d. Lead instructor and instructors qualifications;
   e. Co-instructors and their qualifications;
   f. Training objective;
   g. Event outline/agenda;
   h. Detailed breakout of content to be presented;
   i. Anticipated duration;
   j. Required attendees for each session.
3. Review: Contractor shall submit the Training Plan to the CM, who will then disseminate it for review to the Cx Team. Contractor shall incorporate comments and requirements resulting from the review and resubmit the Training Plan prior to conducting any training sessions.

E. Training Prerequisites: Equipment and Systems Training ("Training") shall not be conducted until the subject system or equipment has completed Start-Up Documentation requirements and Turn-Over. If the Contractor wishes to schedule both Turn-Over and Training on the same day/visit and if the systems are discovered to not be fully-functional at that time, Training shall be canceled and rescheduled.

F. Equipment and Systems Training – Description and Content
1. Description: Equipment and Systems Training events will typically occur over a period of time as systems and equipment are brought online and Turned-Over. Training shall cover proper operation, maintenance, repair, and diagnosis of the systems, equipment, and components installed by the Contractor. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. These sessions shall use the manufacturer's printed installation, operation and maintenance instruction material and shall include a review of these instructions emphasizing safe and proper operating requirements and preventative maintenance. Training shall follow handouts that list the key points in bullet form presentation-style or follow detailed written documentation. Training will not be approved unless it contains accompanying written documentation.
2. Equipment Covered: Training shall be provided for all major items of equipment within the scope of commissioning and per the Specifications.
3. Minimum Training Content: Equipment and Systems Training shall include as a minimum for each type of equipment:
   a. Presentation of the equipment within the context of this facility. Typically, the responsible subcontractor shall provide this introduction to the session. The
trainer shall review how the equipment serves this specific facility. Information shall include equipment amounts, numbers, capacities, sizes and locations and shall show the equipment in applicable system schematics.

b. Conceptual overview of how the equipment works;

c. Names, addresses, phone numbers, websites of sources for information, tools, spare parts, and other details for the equipment;

d. Details of the warranty or guarantee;

e. Intended sequences of operation in all modes of operation;

f. Limits of responsibility (example: unit-mounted controls vs. BAS);

g. Sources of utility support;

h. Routine operator tasks involving monitoring and operation, covering all modes of operation and mode switching as applicable;

i. Relevant health and safety practices/concerns;

j. Common problems and their diagnosis and repair;

k. Proper maintenance schedules, tasks and procedures with demonstrations;

l. Emergency response, documentation and recovery procedures.

4. Scheduling: These events shall be coordinated through and scheduled by the CxA, PSU and CM.

5. Attendees: Contractor shall insure that all appropriate subcontractors be present for these sessions. Any Cx Team member is eligible to attend. Required attendees include the applicable Contractors (Lead), CxA, and the Owner/Operator.

G. Final Systems Operation Training

1. Description: Final Systems Operation Training provides the Owner and Operators a training session on whole-building operation. It shall focus primarily on BAS control of building systems and operation and its impact on building performance. System interactions shall be presented and discussed (such as a combined air handler, chiller, boiler, and terminal unit system), along with a detailed presentation of the sequences of operation and their relationship to the BAS. This training shall be conducted by the BAC with assistance from the CxA, and shall be attended by the Owner, Operators, Contractor, Design Team, and by any other Cx Team members deemed necessary by the CxA or the Owner.

2. Coordination with BAS Training: Detailed BAS component training for the facility Operators shall be considered as part of Equipment and Systems Training. This training shall have been completed prior to Final Systems Operation Training.

3. Scheduling: Final Systems Operation Training shall be conducted after all FPTs have been successfully executed.

4. Attendees: Any Cx Team member is eligible to attend. Required attendees include the BAC (lead), CxA (assist), CM, mechanical contractor, A/E, and Owner/Operators.

1.22 CONTRACTOR DEVELOPMENT OF O&M DOCUMENTATION

A. Contractors are responsible for submitting manufacturer-developed O&M Manuals per the Contract Documents and for developing installation-specific O&M Documentation.

B. O&M Documentation: O&M Documentation is Contractor-developed documentation designed to address the needs of facilities personnel and customized for the context of the specific facility and installation. Contractors, subcontractors and vendors/factory representatives shall prepare, organize, author, and submit applicable O&M content. The foundation of O&M Documentation is manufacturer’s literature (O&M Manuals), with additional Contractor-developed content as specified below. O&M Documentation content is indexed/organized by equipment-type. If a Systems Manual is being developed, Contractor-developed content shall be coordinated with the CxA for inclusion into the Systems Manual.
C. O&M Documentation Content: Content for one system and all associated equipment must be organized and made in one submission. However systems may be submitted separately based on the progress of the project. Content shall be provided and indexed separately as ‘Operations Manual’ and ‘Maintenance Manual’ as specified below.

This Part shall be organized by Division then system/subsystem using a systems approach.

1. Contact Information: Provide contact cross-references to the Parties applicable to the system being described and contained in the main Contact Directory in Part 1.
2. Start-Up and Shutdown Procedures: Provide step-by-step instructions to bring systems from static to operational configurations and from operating to shutdown status. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project.
3. Normal Operating Instructions: Provide a discussion of the normal operation and control of the system. Address operating norms (for example, temperatures, pressures and flow rates) expected at each zone or phase of the system. Supplement the discussion with control and wiring diagrams and data. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project.
4. Emergency Operating Instructions: Provide emergency operating procedures in the event of equipment malfunctions. Provide shutdown instructions for fires, explosions, spills, or other contingencies. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project. This content shall be in the context of the systems themselves and support the Emergency Operations manual to be created by the Owner.
5. Environmental Considerations: Provide a listing of the equipment that requires special operation, reporting, testing, analysis or inspection to comply with federal, state or local environmental laws. Examples of possible list items include backflow preventer inspections, underground storage tank testing, hazardous material or waste usage/storage documentation and air pollution control devices. For each item, include requirements for environmental operation, reporting, testing, analysis and inspection as well as references to respective implementing regulations, statutes or policies.
6. Equipment and System Training Documentation: Include documentation of training for applicable system. Include training agenda, all handouts and presentation materials/content. Reference existence and index of DVD or video tape recording.
7. Sequence of Operation/Control Schematic: Provide the written sequence of operation for the applicable system and the control schematic diagram. This information may be obtained from the A/E or design team members.
8. Maintenance Service Agreements: Provide copies of maintenance service agreements where there pertain to systems involving multiple components and devices as indexed in Part 3.
9. Test, Adjust and Balancing Reports: Insert the TAB Reports provided under Section 23 05 93 for the subject system.

D. Maintenance Manual

Organize this section first by discipline then by equipment number or ID.

1. Maintenance Index: Provide a summary table that indexes the equipment requiring maintenance and indicates the frequency each piece of equipment needs attention, and a reference to the number of the Procedure associated with that frequency. CM shall provide Contractors with an Excel spreadsheet that will be completed by each applicable subcontractor and returned to the CM for incorporation in the Systems Manual.
2. Maintenance Information: Maintenance Information for each indexed entry shall contain the following:
   a. Equipment Data Sheet: Provide a summary of key nameplate and performance data.
   b. Procedures: Provide a ‘Task Card’ or step-by-step procedures for each individual maintenance procedure for a given frequency identified on the Maintenance Index. Include detailed PM procedures, safety instructions and precautions including Lock Out/Tag Out precautions, required skill level, number of personnel needed, frequency, special tools needed, parts needed and estimated time required to
complete the task. These procedures shall be indexed in a manner approved by the Owner. These shall be provided as Microsoft Word files or scanned documents from the manufacturer’s O&M Manual in either PDF or JPG formats)

c. Field Test Reports: Provide Field Test Reports that apply to equipment associated with the system.
d. Troubleshooting Instructions: Provide detailed troubleshooting instructions indexed by common/expected symptoms. Alternatively, make specific reference to page in the manufacturer’s O&M Manual where this information is provided.
e. Extended Warranty Information: Include all warranties for products, equipment, components, and sub-components whose duration exceeds one year. Include warranties on components with the system they are contained within. Reference all specific operation and maintenance procedures that must be performed to keep the warranty valid.
f. Special Tools: Provide a listing of any special tools required for servicing, diagnosis, or repair. Alternatively, reference specific page in the manufacturer’s O&M Manual where this information is provided.
g. Supply Inventory Requirements: Provide a list of maintenance and repair supplies (e.g., spare parts, fuels and lubricants) required to ensure continued operation without unreasonable delays. Identify and list parts and supplies that have long purchase lead times. Alternatively, reference specific page in manufacturer’s O&M Manual that contains this information.
h. Sources of Spare Parts: Provide list or reference to recommended spare parts and contact information where spare parts can be obtained.
i. Lubrication Schedule: Provide a lubrication schedule indicating types, grades, and capacities of lubricants for specific temperature ranges and applications. Alternatively reference the specific page in the manual that contains this information.
j. Maintenance Service Agreements: Provide copies of maintenance service agreements where they pertain specifically to indexed equipment.
k. Manufacturer’s O&M Manual: Include manufacturer’s printed O&M information. These shall be provided in PDF format. If unavailable as PDF from the manufacturer, hardcopy manual shall be scanned and provided as a single file.
l. Application and Installation Instructions: Where applicable and separate from the O&M information, provide the Application and Installation Instructions that indicate how to correctly apply and install/setup the equipment.

E. O&M Documentation Format: Content authored, developed and compiled by the Contractor shall be available both electronically and hardcopy. Specific electronic format shall be coordinated with the CxA. Acceptable electronic formats shall allow for editing and commenting, and include Microsoft Word, Excel, PowerPoint, Access, and Visio; Portable Document Format (PDF), AutoCAD, graphics/photo formats such as JPG,

F. Mechanical Contractor O&M Documentation Submittal: The Division 22 and 23 Contractor shall compile and organize the content for all work of Divisions 22 and 23 and provide one organized submittal. Upon approval by the CxA, the content may be provided in multiple system and equipment-level submittals. Each submission shall be provided at least one month prior to the start of the Acceptance Period. This submittal will be reviewed by A/E, CxA, Owner, and CM within two weeks of the submission. Contractor shall incorporate comments and corrections and resubmit prior to the start of the Acceptance Period. Within two weeks of Functional Completion, the Division 22 and 23 Contractor shall provide the final version of all O&M Documentation information in one submittal.

G. Other Contractor O&M Documentation Submittals: Submittals by all other Contractors (other than Div 22 and 23 shall be provided per specifications within their respective Division of work.
H. Maintenance and Updates of O&M Documentation Content: Contractors shall maintain the applicable O&M Documentation content throughout the Warranty Period. All hard copies will be retained at the Owner’s facilities or electronically online at a web-based FTP or Internet site. Changes throughout the Warranty Period shall be fully coordinated with the CxA. Maintenance of O&M Documentation content shall include:
1. Changing any indicated settings, parameters, and other operational parameters that were changed by the Contractor during the Warranty Phase.
2. Changing any instructions as to procedures that needed to be changed during the Warranty Phase.
3. Changing the Record Schedules and/or Sequences of Operation if they were changed during the Warranty Phase.
4. Updating any O&M Documentation content if changed or updated by the manufacturer.

I. Electronic Copies: Electronic copies may be posted to the Portal. When a posting is made, emails shall be sent to the receiving Parties (and copied to any other interested Parties) stating that the submission has been posted. Posting needs only to be the current submission. Contractor shall maintain all versions of the submission and provide upon request. When electronic submissions are made on electronic media such as CDs, six copies of the electronic media shall be provided.

J. Paper-Based (Hard) Copies: The number of copies shall be as follows:
1. Initial construction phase submission shall include 6 copies. All will be returned within two weeks.
2. Pre-Acceptance Phase submission shall include 6 copies. All will be returned at the completion of Acceptance Testing.
3. Final Systems Manual content submission shall include 6 copies. All will remain at the Owner’s facilities from then on.
4. Modifications made to the information shall be made to all copies.

1.23 SYSTEMS MANUAL PREPARATION AND LOGISTICS

A. Definition: The Systems Manual is the final deliverable from the Cx process, and provides the information needed to understand, operate, and maintain the facility and its systems. It is typically developed by the CxA, but with content required to be provided by the design team and the Contractors. The Systems Manual expands the scope of standard O&M documentation to incorporate additional information developed through the Cx process. The Systems Manual should be the repository of all updates and corrections as they occur (even throughout Occupancy). It is narrative in nature and organized by system types and by area/usage of the facility (if applicable). Systems Manual content typically includes narrative descriptions of the facility and systems, sequences of operation, schematic diagrams, cuts from design drawings and equipment literature, photos, and manual start/stop and emergency operating procedures for important equipment.

B. Systems Manual Lead Developer Responsibilities: The lead developer of the Systems Manual for this project shall be the CxA. The lead developer is responsible for organizing and producing the Systems Manual and for managing the content and contributions from the Parties responsible for providing technical content. The Party responsible for each topic shall assemble, author, develop, coordinate, or otherwise produce the content for that topic as specified below and provide to the lead developer. Requirements as specified include requiring the applicable Contractors to author project-specific information in a consistent format in addition to submission of standard pre-printed manufacturer’s O&M and product information.

C. Systems Manual Contractor Responsibilities: Contractor, Subcontractors and Vendors/Factory Representatives shall prepare, organize and submit applicable content for the comprehensive and coordinated Systems Manual as specified below. Some of the material required from the
Contractors will need to be authored or customized specifically for this project and facility. Contractor content is indicated by “CM” who is responsible for consolidating the content and materials from the various individual Contractors. Content for one system and all associated equipment must be organized and made in one submission. However systems may be submitted separately based on the progress of the project. Each submission shall be indexed as a sub-entity to the overall Systems Manual submission.

D. Division 22 and 23 Contractor Responsibilities: The Division 22 and 23 Contractor shall compile and organize the content for all work of Divisions 22 and 23 and provide one organized submittal. Upon approval by the CA, the content may be provided in multiple system and equipment-level submittals. Each submission shall be provided at least one month prior to the start of the Acceptance Period. This submittal will be reviewed by A/E, CxA, Owner, and CM within two weeks of the submission. Contractor shall incorporate comments and corrections and resubmit prior to the start of the Acceptance Period.

E. Final Systems Manual Content Submittal: Within two weeks after Functional Completion, Contractors shall provide the final version of all Systems Manual information. Division 22 and 23 Contractor shall provide final version in one single submittal.

F. Maintenance and Updates of Systems Manual Content: Contractors shall maintain the applicable Systems Manual content throughout the Warranty Period. All hard copies will be retained at the Owner’s facilities or electronically online at a web-based FTP or Internet site. Changes throughout the Warranty Period shall be fully coordinated with the CxA. Maintenance of Systems Manual content shall include:
   1. Changing any indicated settings, parameters, and other operational parameters that were changed by the Contractor during the Warranty Phase.
   2. Changing any instructions as to procedures that needed to be changed during the Warranty Phase.
   3. Changing the Record Schedules and/or Sequences of Operation if they were changed during the Warranty Phase.
   4. Updating any Systems Manual content if changed or updated by the manufacturer.

   1. Electronic Version: The electronic version of the Systems Manual will be a series of files organized in subdirectories with a summary index with hyperlinks to the various documents and or references to separate CDs that contain the information. During authoring, sample format Microsoft Office documents (Word, Excel or Powerpoint) will be provided to be used by vendors and contractors to provide the custom-authored content to the lead developer for final compilation. Electronic copies of the product data shall be in PDF format. Drawings shall be in AutoCAD or PDF format.
   2. Electronic File Submissions. Electronic files of Systems Manual content may be posted to the project website. When a posting is made, emails shall be sent to the receiving Parties (and copied to any other interested Parties) stating that the submission has been posted. Posting should only include the current submission, although the Contractor shall maintain all versions of the submission and provide upon request. When electronic submissions are made on electronic media such as CDs, six copies of the electronic media shall be provided.
   3. Paper-Based (Hard) Copies: The number of copies shall be as follows:
      a. Initial construction phase submission shall include 6 copies. All will be returned within two weeks.
      b. Construction Phase submissions shall include 6 copies. All will be returned at the completion of Acceptance Testing.
      c. Final Systems Manual content submission shall include 6 copies. All will remain at the Owner’s facilities from that time forward.
      d. Modifications made to the information shall be made to all copies.
1.24 SYSTEMS MANUAL CONTENT AND ORGANIZATION

A. Systems Manual Scope: The Systems Manual format and content requirements shall be as follows. Documents developed or otherwise provided as specified in the Contract Documents should be used directly or referenced to the extent possible, including but not limited to OPR/BOD narratives, shop drawings, submittals, and O&M Manuals. Responsible parties are as indicated in square brackets; tasks not delineated by a responsible party are the responsibility of the lead developer.

B. Part 1 – Facility Information
   2. Contact Directory: Include the contact information for all contractors, subcontractors, vendors, manufacturers, and any other entity that has provided goods or services installed at the facility. Contact information should include name, website, address, phone numbers, and technical support phone numbers and email addresses.
   3. General Facility and System Description: A/E Describe the function of the facility. Detail the overall dimensions of the facility, number of floors, foundations type, expected number of occupants, and facility category code. List and generally describe all the facility systems listed in Part II - Primary Systems Information and any special building features (for example, cranes, elevators, and generators).
   4. Utility Connection and Cutoff Plans: A/E Provide utility site and floor plans that indicate the exterior and main interior connection and cutoff points for all utilities. Include enough information to enable someone unfamiliar with the facility to quickly locate the connection and cutoff points. Do not include items such as contour lines, elevations, and subsurface information on the site plans. Indicate the room number, panel number, circuit breaker, valve number, etc., of each connection and cutoff point, and what that connection or cutoff point controls. These plans are in addition to the floor plans.
   5. Warranty Information: CM Provide all warranties indexed in a logical order.

C. Part 2 - Primary Systems Operating Information
   This Part shall be organized by Division then system/subsystem using a systems approach. Part 2 contains system information, whereas Part 3 contains equipment information.
   1. System Description [A/E]: Provide a detailed discussion of the system composition and operation. Include technical details that are essential for an understanding of the system. A/E shall provide narratives to the CM who shall provide these to the major subcontractors for use in preparation of their required content. Also cross-reference O&M data contained in Part 4 and product data and submittals contained in Part 4.
   2. Contact Information [CM]: Provide contact cross-references to the Parties applicable to the system being described and contained in the main Contact Directory in Part 1.
   3. System Flow Diagrams [A/E]: Provide a flow diagram indicating system liquid, air (do not include ductwork) or gas flow during normal operations. Integrate all system components into the diagram. Note that a compilation of non-integrated flow diagrams for the individual system components is not acceptable.
   4. Diagrammatic Plans [A/E]: Provide floor plans indicating the location of equipment and configuration of the system installation. Include the configuration of associated piping or wiring, subordinating structural features to utility features.
   5. Start-Up and Shutdown Procedures [CM]: Provide step-by-step instructions to bring systems from static to operational configurations and from operating to shutdown status. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project.
   6. Normal Operating Instructions [CM]: Provide a discussion of the normal operation and control of the system. Address operating norms (for example, temperatures, pressures and flow rates) expected at each zone or phase of the system. Supplement the discussion with control and wiring diagrams and data. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project.
7. Emergency Operating Instructions [CM]: Provide emergency operating procedures in the event of equipment malfunctions. Provide shutdown instructions for fires, explosions, spills, or other contingencies. Installing Contractor or Vendor/Manufacturer shall author this specifically for this project. This content shall be in the context of the systems themselves and support the Emergency Operations manual to be created by the Owner.

8. Environmental Considerations [CM]: Provide a listing of the equipment that requires special operation, reporting, testing, analysis or inspection to comply with federal, state or local environmental laws. Examples of possible list items include backflow preventer inspections, underground storage tank testing, hazardous material or waste usage/storage documentation and air pollution control devices. For each item, include requirements for environmental operation, reporting, testing, analysis and inspection as well as references to respective implementing regulations, statutes or policies.

9. Equipment and System Training Documentation [CM]: Include documentation of training for applicable system. Include training agenda, all handouts and presentation materials/content. Reference existence and index of DVD or video tape recording.

10. Sequence of Operation/Control Schematic [A/E]: Provide the written sequence of operation for the applicable system and the control schematic diagram.

11. Maintenance Service Agreements [CM]: Provide copies of maintenance service agreements where there pertain to systems involving multiple components and devices as indexed in Part 3.

12. Test, Adjust and Balancing Reports [CM]: Insert the TAB Reports provided under Section 23 05 93 for the subject system.

D. Part 3 - Maintenance Manual

Organize this section first by discipline then by equipment number or ID.

1. Maintenance Index [CM]: Provide a summary table that indexes the equipment requiring maintenance and indicates the frequency each piece of equipment needs attention, and a reference to the number of the Procedure associated with that frequency. CM shall provide Contractors with an Excel spreadsheet that will be completed by each applicable subcontractor and returned to the CM for incorporation in the Systems Manual.

2. Maintenance Information [CM]: Maintenance Information for each indexed entry shall contain the following:
   a. Equipment Data Sheet: Provide a summary of key nameplate and performance data.
   b. Procedures: Provide a ‘Task Card’ or step-by-step procedures for each individual maintenance procedure for a given frequency identified on the Maintenance Index. Include detailed PM procedures, safety instructions and precautions including Lock Out/Tag Out precautions, required skill level, number of personnel needed, frequency, special tools needed, parts needed and estimated time required to complete the task. These procedures shall be indexed in a manner approved by the Owner. These shall be provided as Microsoft Word files or scanned documents from the manufacturer’s O&M Manual in either PDF or JPG formats.
   c. Field Test Reports: Provide any Field Test Reports that apply to equipment associated with the system.
   d. Troubleshooting Instructions: Provide detailed troubleshooting instructions indexed by common/expected symptoms. Alternatively, make specific reference to page in the manufacturer’s O&M Manual where this information is provided.
   e. Extended Warranty Information: Include all warranties for products, equipment, components, and sub-components whose duration exceeds one year. Include warranties on components with the system they are contained within. Reference all specific operation and maintenance procedures that must be performed to keep the warranty valid.
   f. Special Tools: Provide a listing of any special tools required for servicing, diagnosis, or repair. Alternatively, reference specific page in the manufacturer’s O&M Manual where this information is provided.
g. Supply Inventory Requirements: Provide a list of maintenance and repair supplies (e.g., spare parts, fuels and lubricants) required to ensure continued operation without unreasonable delays. Identify and list parts and supplies that have long purchase lead times. Alternatively, reference specific page in manufacturer’s O&M Manual that contains this information.

h. Sources of Spare Parts: Include reference to contact information where spare parts can be obtained.

i. Lubrication Schedule: Provide a lubrication schedule indicating types, grades, and capacities of lubricants for specific temperature ranges and applications. Alternatively reference the specific page in the manual that contains this information.

j. Maintenance Service Agreements: Provide copies of maintenance service agreements where they pertain specifically to indexed equipment.

k. Manufacturer’s O&M Manual: Include manufacturer’s printed O&M information. These shall be provided in PDF format. If unavailable as PDF from the manufacturer, hardcopy manual shall be scanned and provided as a single file.

l. Application and Installation Instructions: Where applicable and separate from the O&M information, provide the Application and Installation Instructions that indicate how to correctly apply and install/setup the equipment.

E. Part 4 - Construction Documentation

1. Record Drawings [A/E]: Provide an index of all Record Drawings with drawing number, title, and electronic file name(s) including electronically referenced drawings.

2. Record Specifications [A/E]: Provide a detailed index of the Record Specification. Include sections and major items in the specification all indexed to the appropriate page number.

3. Approved Product Data and Shop Drawings [A/E]
   a. Provide an index of all product data and shop drawings. This shall list all equipment with the associated submittal number.
   b. Organize and compile only APPROVED product data and shop drawings. Providing these in a filing format is acceptable provided all files are identified and organized for easy access.
   c. This information is required for this Part in its entirety regardless of inclusion in any other sections of the Systems Manual.

4. Commissioning Record [CxA]: Provide complete Cx records including all Start-Up Documentation and Functional Performance Test documentation.

1. Preventative Maintenance Specification [CxA]: Specification for day to day maintenance of the facility, including operating log requirement, reports, and preventative maintenance tasks for each system, including recommended inspections, and tests.

2. Recommissioning Test Log [CxA]: Blank testing plan for future use in recommissioning.

1.25 COMMISSIONING PENALTIES

A. Functional Performance Testing (FPT) Failures: Penalties resulting from FPT failures are specified in Section 01 91 10.

1.26 PHASING PLAN

A. If Contractor intends to start, run, or occupy portions of systems in phases, Contractor shall submit a Phasing Plan for phasing in areas/portions of systems that will be connected subsequent to the initial portions. Phasing Plan shall specifically address:
   1. Pipe and Duct Cleaning: Indicate the configurations and protocols for isolating subsequent regions and then protecting the preceding regions when the subsequent region is cleaned/flushed and connected.
2. Pipe Disinfection: Indicate the plan for disinfecting each region of potable water or medical gas pipe that requires disinfection. Indicate how the preceding regions of the system will be protected when connecting subsequent regions.

3. Piping Certification/Testing: Indicate the plan for certifying each region of pipe that requires certification and or testing such as laboratory gases, medical gases, and RO/DI water (testing for water quality). Indicate how the preceding regions of the system will be protected when connecting subsequent regions. Indicate how you will verify that the certification/test results on the previous systems have not been invalidated.

4. System Modifications: Indicate the protocols for making subsequent changes to the systems of pipe and duct when the systems have already been cleaned, flushed, pressure tested, disinfected, and certified.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used in the Cx process shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

B. Standard Testing Instrumentation: Standard testing instrumentation normally used for performance assessment and diagnosis will be provided by the CxA. Refer to Sections 23 08 00 and 26 08 00 for a list of applicable test equipment.

C. Special Tools: Special equipment, tools and instruments (only available from a vendor, and specific to a piece of equipment) that are required for testing equipment in accordance with these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon completion of the project.

2.2 WEB-BASED COMMISSIONING PORTAL

A. General: The Cx Portal ('Portal') is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CxA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process. The Portal uses a hierarchical object tree to represent building systems, components and devices. From this object tree, one can access associated information at and below the applicable level. All applicable elements of information are associated with the object tree. The Portal facilitates either completing information directly via the software or by printing forms to fill out in the field.

B. Participation: All general and major subcontractors participating in the Cx process shall participate in the use of the Portal to document the Cx procedures.

C. Requirements for Use: Options for accessing and interfacing with the Cx Portal are as follows:

1. Print, Test, and File: Using this approach, Contractors simply go online to the Portal using a web browser, print checklists and tests as needed, fill them out in the field, and enter the results back into the Portal database when completed.

2. Online in the Field: The applicable documents can be accessed and filled out live and online if the Contractor has the means to access the Internet while working in the field using a local Wi-Fi network or wireless air card.

3. Database Client: At the Contractor's option, the CxA can provide the Contractor with a software tool that will allow the Contractor to download electronic test database files from
the Portal, work on the database files in the field electronically (but offline), and later synchronize their entries with the master database on the Portal.

D. Portal Training: Included in the contract are two Contractors training sessions given by the CxA (one scheduled near the Construction Phase Cx Kickoff Meeting and one scheduled prior to the first equipment Start-Up). Contractors shall send at least one representative to at least one training session. Each Contractor is entitled to two hours phone technical support beyond training sessions.

PART 3 - EXECUTION

3.1 START-UP STANDARD OF CARE

A. Procedures that establish a minimum Standard-of-Care for the start-up, checkout and testing of applicable equipment are specified in the individual technical specifications and in Section 01 91 00 and Sections 23 08 00 and 26 08 00. Contractor shall apply this Standard-of-Care and document per the Cx requirements.

3.2 FUNCTIONAL PERFORMANCE TEST EXECUTION

A. Functional Performance Testing procedures are specified in Section 01 91 10. Contractor shall participate in the development and approval of the testing procedures, as well as participate as required in the initial sample of tests as indicated herein.

3.3 ACTION LIST

A. CxA shall maintain an Action List tracking Action Items (required information, identified deficiencies, work required, etc.) that relate to the Cx process. Each item shall be tracked with the initiator, the Parties responsible, due date, the date of closure, and a description of the resolution. Each item shall be categorized for sorting and tracking and for documentation on applicable forms.

B. CxA will disseminate this list as appropriate to keep all Parties informed.

C. All Parties indicated as responsible for an Action Item shall respond. Parties participating using the Portal shall respond via the Portal. Other Parties may respond by separate email.

D. The originator of an Action Item shall close it and record the resolution. Closing an Action Item amounts to entering the date on which it was addressed.

3.4 SEQUENCING ILLUSTRATION

A. A simplified schematic diagram of the precedents involved in the Cx process is provided below. The diagram is generally applicable on a system-by-system basis. Different systems or areas of the building may be phased or sequenced such that different systems are at different points in the Cx process. The diagram indicates tasks for the Contractor, the A/E and the CxA. Tasks for each are indicated vertically below their name. The individual tasks are as defined herein. Management protocols are also covered herein.

END OF SECTION 019100
PART 1 - GENERAL

1.1 WORK INCLUDED

A. Functional Performance Testing (FPT; ‘testing’) of systems.
B. Documentation of FPTs.
C. Acceptance criteria.

1.2 SCOPE

A. This section describes the Functional Performance Testing (FPT) process, procedures, and requirements. It is intended to illustrate the Contractor’s requirements for assisting the Commissioning Authority (CxA) with the Functional Performance Testing of systems, and (ii) to demonstrate the level at which systems and equipment will be tested prior to being deemed ‘Acceptable’ to the Owner.

B. The CxA will prepare itemized and detailed FPT plans and procedures that:
   1. Specify individual tests and procedures that meet the general requirements of the Cx Plan and commissioning (Cx) process;
   2. Serve to document and record the testing procedures and the results of the tests.

C. The Contractor shall provide technical input to the CxA as needed during the development of the final project FPTs.

D. Example (referred herein to as ‘generic’) FPTs are provided as illustration to the Contractor of the level of detail to which FPTs will be conducted.

1.3 RELATED WORK AND DOCUMENTS

A. The Cx process references many related Sections, particularly Section 01 91 00 - General Commissioning. It is important for all Contractors subject to the Cx process to be familiar with Section 01 91 00.

B. Refer to Section 01 91 00 for a complete list of Sections on Related Work.

1.4 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 01 91 00 for a complete list of Definitions and Abbreviations. This paragraph includes a comprehensive list of acronyms describing the various required Parties referred to in the Section for individual FPTs.

1.5 REFERENCE STANDARDS

A. Refer to Section 01 91 00 for a complete list of Reference Standards.
1.6 FUNCTIONAL PERFORMANCE TESTING

A. Objectives and Scope: Systems shall be tested to ensure proper operation through all modes of operation including normal expected operation, maintenance operation as well as proper response to system and component failures that are considered abnormal operation as indicated below.

1. Normal Operation: Each system shall be operated through all modes of operation (seasonal, occupied, unoccupied, warm-up, cool-down, part- and full-load) where there is a specified system response. Verifying each sequence in the sequences of operation is required. These series of tests will demonstrate that the systems and equipment operate throughout typical operation including normal adjusting, cleaning, media replacement, and maintenance.

2. Abnormal Operation: Test each system to simulate possible abnormal conditions and verify proper responses to such modes and conditions as power failure, equipment and component failure, freeze condition, deviation of operating parameters outside of normal, no flow, supporting utility failure, human error, etc. Abnormal operation tests shall demonstrate proper and safe response to the subject systems and the other systems that it affects or integrates with. These tests shall also demonstrate proper enunciation of abnormal conditions to quickly and effectively notify users and operators of such condition. Specific modes required in this project are given in this section and any other sections where test requirements are found.

B. Development of Test Procedures: CxA shall develop specific test procedures and forms to verify and document proper operation of each piece of equipment and system. Prior to execution, the CxA shall provide a copy of the test procedures to the Contractor who shall review the tests for feasibility, safety, equipment and warranty protection, and scope. The CxA will also submit the tests to the A/E for review.

1. Contractor shall review the FPTs in detail and approve them.

2. The CxA shall review Owner-contracted testing, factory testing, or required Owner acceptance tests for which the CxA is not responsible to oversee. Review shall include content, scope, and documentation format, and shall determine what further testing or format changes may be required. Redundancy of testing shall be minimized.

3. The purpose of any given specific FPT is to verify and document compliance with the stated criteria of acceptance.

C. Scheduling: CM shall schedule the Functional Performance Testing after system 'Turn-Over' occurs (Turn-Over is the official Contractor notification that systems have completed Start-Up and are ready for testing and submittal and review of all the required submittals has occurred). To the extent practical, tests shall be scheduled to allow efficient and contiguous testing of inter-related systems and equipment.

D. Phasing: Non-interdependent segments of the project testing can be phased. Phasing of this project is described below

E. Participation: CxA will direct and conduct Functional Performance Tests after Start-Up Documentation of systems and equipment has been reviewed and accepted and system ‘Turn-Over’ occurs. Conceptual procedures for the Functional Performance Testing are outlined elsewhere in this Section. CxA will execute the FPTs unless otherwise specified. Contractor shall assist as described above with manipulation of the systems or equipment, provision of supporting equipment or materials (lifts, ladders, specialty test equipment, safety equipment),
and on-the-spot remediation of minor identified deficiencies whenever possible. Required participation is outlined in the generic FPTs provided elsewhere in this Section.

1. Any Cx Team member may attend any FPT. Required Parties are as described below.

2. Typically, multiple parties are required for any given test, yet participation for any given party is only required for the respective portion of the test for which the party is responsible. The CxA will notify each trade of the testing which they must participate. Only those notified Contractors, which participate in the testing, will be credited for the hours against their FPT allotment.

3. No Party involved with the project is prohibited from participation in or witnessing of any tests. Any Contractor may elect to witness all tests on their systems even if their involvement is not directly required (for instance, BAC involvement is sometimes required on the first few of a sample and not on the entire sample).

4. The maximum required time for contractor FPT participation (in hours) is indicated below, by trade. Each category of support is to be provided by the contractor responsible for the installation of the system (e.g., the fire alarm support is to be provided by the FAC). Additional time required by the Contractor due to incompleteness of the system, failure of tests, or failure of sampling criteria shall be at the contractors expense, with no additional costs to the Owner. Mechanical (HVAC) FPT Support – 60 hours.
   a. Mechanical (Plumbing) FPT Support – 30 hours.
   b. Building Automation System FPT Support – 120 hours
   c. Electrical FPT Support – 70 hours
d. Fire Protection FPT Support - 8 hours.
e. Fire Alarm FPT Support – 16 hours.
f. TAB FPT Support – See section 230593, Testing Adjusting, and Balancing for Systems Verification requirements
g. Security System FPT Support – 16 hour

5. The CxA will track the Contractor’s FPT participation based on 4-hour segments of work, except as noted below.

F. Detailed FPT Development and Contractor Review: CxA will prepare detailed and itemized testing procedures to define and document the FPT. These will be typically be developed during the Construction Phase and completed during the Acceptance Phase. The CxA shall submit these procedures to the Contractor for review. Contractor shall indicate all required limitations, safety procedures, maximum thresholds, and any other parameters during the FPT development. Contractor shall be responsible for any damage to the equipment caused by Functional Performance Testing done per the procedures and within the limitations of the approved procedures.

G. Completeness: All systems must be completed and ready for FPT. All Start-Up Documentation, factory-authorized field testing, independent testing agency tests, and TAB procedures must be complete and the control systems must be tested and started for the respective system or component.

H. Test Documentation: CxA will conduct tests, and/or witness tests as applicable. CxA will record all test results on the forms developed for the testing. CxA will ‘Pass’ or ‘Fail’ the testing and record the date and time of the test. Deficiencies shall clearly be indicated when the test is failed. When all related testing is completed successfully, CxA shall recommend acceptance of the system or component.

I. Deficiencies and Retesting: When deficiencies are identified during testing, depending on their extent or magnitude, they can be corrected during the test and the testing can continue to successful completion. More significant deficiencies will require failure of the test and re-testing. Deficiencies of this magnitude will result in an Action Item on the Action List. The resolution of the deficiency will then subsequently be tracked by the CxA via the Action List. All tests shall be repeated until successful completion. Refer to more specific provisions below.
J. Sampling: Some types of identical equipment (such as terminal devices) will be tested using a sampling strategy. The sample percentage is indicated in the generic FPT provided elsewhere in this Section.

K. Max Failure Limit and Sample Percentages: A ‘Maximum Failure Limit’ is indicated along with the ‘Sampling Percentages’. The Max Failure Limit indicates the maximum percentage of the tested devices that may have any test that fails before an entirely new sample must be tested. This is based on the concept that if many failures occur, it is a result of inadequate start-up by the Contractor. When the maximum number of failures is reached, testing on that sample will be terminated and re-testing will be scheduled.
   1. If no Max Failure Limit is indicated, all tested samples must pass (Max Failure Limit = 0%).
   2. Where sample tests involve multiple systems (i.e., checking strainers on different hydronic systems), the Maximum Failure Limit will apply per system.
   3. The responsible Contractors shall pay the CxA cost of that sample test, and redo the start-up/TAB for the applicable devices/systems.
   4. All work necessitated by sample failures shall be at no cost to the Owner.

L. Opposite Season Testing: Testing procedures shall be repeated and/or conducted as necessary during appropriate seasons. Opposite Season testing will be required where scheduling prohibits thorough testing in all modes of operation. Air handler and central heating system testing for heating-related modes of operation and control loops shall be tested during outside air temperatures below [35°F].

M. Approval. The CxA passes each test and subsequently recommends approval to Owner who reviews and approves the FPT.

1.7 COORDINATION BETWEEN TESTING PARTIES

A. Factory Start-Ups: For many systems and equipment, Factory Start-Ups are specified. These Factory Start-Ups will be reviewed and checked during Functional Performance Testing. All costs associated with the Factory Start-Ups are included with the bid unless otherwise noted. Contractor shall make notification of when Factory Start-Ups are occurring and coordinate these with witnessing Parties. The CxA and other Cx Team members may witness Factory Start-Ups at their discretion. Aspects of Functional Performance Testing accomplished during the Factory Start-Ups may be accomplished and approved by the CxA if they meet the intent of the FPT.

B. Independent Testing Agencies: For systems where Independent Testing Agencies are specified, the cost of this testing shall be included with the bid unless otherwise noted. Much of the testing performed by Independent Testing Agencies will cover aspects required in the Start-Up Documentation and Functional Performance Tests.
   1. Contractor and testing agencies shall coordinate with the CxA so that the CxA can witness the testing and approve the applicable aspects of the FPTs.
   2. The CxA may in some cases independently spot-check work of the testing agencies if the tests were not witnessed. However, it is not the intent for the CxA to re-accomplish testing by others that is specified in the construction specifications. For instance, much of the testing requirements for the electrical systems will be performed by the independent electrical testing agency provided under the bid. The CxA shall witness the indicated sample of the testing and record the results in the record of Functional Performance Tests.
   3. Contractor is responsible for coordinating the efforts of testing agency with that of the Cx process. Documentation shall be contiguous and seamless and duplication should be avoided. Testing agencies shall complete the documentation of the Cx process as required.
C. Specialized Testing by Contractor: Where Specialized Testing is specified in the technical
specifications, the Contractor, subcontractor, vendor, or factory representative as applicable
shall conduct the Specialized Testing and provide all specialized instrumentation and
equipment. CxA and other Cx Team members may witness tests at their discretion. The CxA
may in some cases independently spot-check the results of the tests if the tests were not
witnessed. However, it is not the intent for the CxA to re-accomplish testing that is specified in
the construction specifications. All Specialized Testing procedures shall be integrated with the
Cx process and all documentation shall be coordinated and integrated with the documentation
of the Cx process. Examples of Specialized Testing include but are not limited to:
1. Acceptance testing of the fire alarm system
2. Fire suppression system hydraulic tests
3. Electrical system testing per NETA

1.8 FPT ACCEPTANCE CRITERIA

A. The Acceptance Criteria shall be as follows unless more specifically indicated within individual
tests. CxA may exercise professional judgment to relax requirements and pass tests and
recommend approval when appropriate.
1. Capacity: Capacity and/or equipment performance will generally be as specified ±5%.
2. Efficiency: Efficiency where specifically indicated in the documents will be ±5%. When
inferred from manufacturer’s catalogue data, criteria will be ±10%.
3. Balancing: Balancing-related criteria will be ±5% for water and ±10% for air.
4. Accuracy: Accuracy/repeatability on sensing devices will be as specified for the device.
CxA and TAB will use calibrated gages for independent validation and use judgment in
passing or failing the devices. In many cases, the coordination of multiple related
sensors is more important than absolute accuracy.
5. Controls: Control feedback loop response and setpoint deviation criteria will be as
specified in Section 25 08 00.
6. Sequences: HVAC sequence-related criteria will be as explicitly specified in the
documents and as interpreted by the CxA. Code required sequencing shall be per the
applicable code.
7. System sequences shall be as required by the approved shop drawings.
8. Motor Phase Imbalance: Shall be no more than 2% (Amps and Volts).
9. Noise Levels:
   a. Occupied Spaces: As indicated in the Owner’s Project Requirements or Basis of
   Design (OPR/BOD) document. Otherwise, noise level shall be as recommended
   in the most current version of the ASHRAE Handbooks for the applicable
   occupancy.
   b. At limits of the enterprise or facility: As required by current local ordinances.
10. Indoor Environmental Parameters (T, RH, CO2, VOC): Shall be as indicated in the Basis
    of Design document. Otherwise, as recommended in the most current version of the
    ASHRAE Handbooks for the applicable occupancy.
11. Air Pressurization: As indicated in the OPR/BOD document. Otherwise, as indicated in
    the most current version of the ASHRAE Handbooks for the applicable occupancy.
    Smoke/shaft pressurization shall be as required by NFPA to maintain maximum door
    opening forces and to restrict the passage of smoke.
12. Indoor Lighting Levels: As indicated in the OPR/BOD document. Otherwise, as
    recommended in the most current version of the IES Handbooks for the applicable
    occupancy.
13. Electrical Systems: Shall be in accordance with manufacturer’s recommendations of
    individual components and devices, NFPA 70B and International Electrical Testing
    Association (NETA) testing specifications NETA ATS-Latest Version.
14. Inter-system interfaces and coordination: As specified and generally to ensure safe,
    reliable, and robust operation.
PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance within the tolerances specified. All equipment shall be calibrated according to the manufacturer’s recommended intervals. Calibration tags shall be affixed or certificates readily available. Supplier of instrumentation shall submit the calibration certificates along with the start up documentation.

B. Standard Testing Instrumentation: Standard instrumentation normally used for performance assessment and diagnosis will be provided by the CxA for tests being conducted by CxA. All other instrumentation shall be provided by the Contractor. The instrumentation to be provided by the CxA includes:
1. Electronic manometer (for air and flow hood)
2. Electronic manometer (for water)
3. Temperature instruments and gauges
4. Humidity instruments and gauges
5. CO2 instrument
6. Sound meter
7. Light level meter
8. Electronic multimeter
9. Power analyzer (including power factor and THD)
10. Receptacle tester
11. Tachometer
12. Belt tensioner
13. Ultrasonic flow meter
14. Vibration meter capable of measuring peak-to-peak acceleration

C. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and provided to the Owner.

D. Provide a temporary license to software needed to access the BAS at both the terminal equipment and on the primary LAN/at primary controllers. Provide all configuration utilities needed to read all parameters and set up terminal boxes. Provide temporary graphic interface software license for use during the Acceptance Phase.

PART 3 - FUNCTIONAL PERFORMANCE TESTS (SYSTEMS AND EQUIPMENT RELATED)

3.1 PREREQUISITES

A. All equipment, components, and devices applicable to the FPT must be started and operational and systems must be ‘Turned-Over’ to the Cx Team. This includes completion and of Start-Up Documentation, pressure testing of equipment, duct, piping; flushing/cleaning of applicable systems; completed labeling and identification; completed insulation of applicable systems; and all other requirements for placing system into dynamic operation.

B. Unless specifically agreed to by the Owner and CxA, all support systems shall be complete prior to FPT. For instance, an air handler will require that:
1. The electrical system serving it is completed and tested;
2. The hydronic systems serving it have been pressure tested, flushed, and functional performance tested;
3. Balancing has been accomplished on the air and water sides;
4. The control systems have been started and calibrated.
C. The CxA shall determine the optimal sequence of testing.

3.2 FUNCTIONAL TESTING PROCESS

A. Functional Performance Testing (‘Functional Testing’) on any given system shall typically begin with testing device-level elements such as sensors and actuators; progress to component-level assemblies of devices; then to system-level, then to inter-system level, then to building-level.

B. Functional Testing of systems shall generally proceed from the utilities to the central systems, to the distribution systems, to the zone terminal units and services. CxA shall plan this process and communicate it through a precedent diagram (in Gantt or Pert format). Construction Manager shall reflect that process in the Construction Schedule. Subcontractors shall perform work in accordance with the schedule.

3.3 COMMON ELEMENTS FOR ALL SYSTEMS

A. Required submittal documentation shall be present and located convenient to testing area. Validate that all required documentation has been submitted and is per the contract requirements.

B. Contractor shall provide the completed Start-Up Documentation and shall follow Turn-Over procedures as specified in Section 01 91 00. CxA shall review the Start-Up Documentation and spot-check the installation prior to or at the beginning of the FPT.

C. Contractor shall demonstrate that access is sufficient to perform required maintenance.

D. BAS trends shall have been established as required in the documents. These shall be available for review prior to or during the FPT.

E. All dynamic systems powered by electricity shall be tested to simulate a power outage to ensure proper sequencing. Those on emergency power or uninterruptible power shall be tested on all sources.

F. Capacities and adjusted/balanced conditions as applicable shall be subject to check.

G. Sequencing Verification: All modes of operation and actions shall be verified for equipment/system samples.

H. System and equipment configurations shall be compared against the contract documents.

I. Verify functions (such as heating and cooling) are coordinated and do not overlap or ‘fight’.

J. All adjusted, balanced, controlled systems shall be assessed to determine the optimal setting for the system as applicable. The optimal settings should be determined to establish reliable, efficient, safe and stable operation.

K. BAS or Local Panel Dynamic Graphics: The graphic displays for all components, systems, and areas required to be represented by a BAS graphic shall be checked for adequacy and accuracy. Furthermore, when setpoints or other parameters are required to be adjustable, CxA shall verify that they can be adjusted directly from the graphic screen.

L. Emergency power tests for mechanical systems will be conducted in concert with the testing of the emergency power systems. Mechanical contractor shall be available for the power outage
test to test mechanical systems under a power outage. This is in addition to the requirements specified for the mechanical system.

M. Where system and zones are designed for various modes of operations, test representative systems in all modes of operation. This includes:
   1. Seasonal Modes
   2. Sequencing Modes
   3. Emergency Modes

SECTION 02 41 00 – SITE DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: The abandonment and removal work, as specified herein, is not intended to be performed as a wrecking operation but as preparatory work relative to the performance of the various construction operations of the Project.
   1. In general, the extent of the removal work is as indicated on the Drawings.
   2. Demolition and removal of certain in-line structures and pipe sewers.
   3. Plugging existing facilities.
   4. Filling existing facilities.
   5. Demolition and removal of valves and valve boxes.
   6. Removal of existing hydrants, water fountains, and valves.
   7. Removal of existing water services.
   8. Removal of existing electric service and ductbank including vaults, handholes, transformers etc.
   9. Removal of existing telephone service and ductbank including handholes, vaults, etc.
   10. Clearing and grubbing.
   11. Removing existing above-grade improvements.
   12. Removing existing below-grade improvements.

B. Work shall be conducted in accordance with the General Conditions, Supplementary Conditions, Division 1, and the requirements of this Section.

1.2 RELATED SECTIONS

1. Section 33 01 01 – Maintenance and Support of Existing Utilities.
2. Section 31 20 00 – Earth Moving.
3. Section 31 22 00 – Grading.
4. Section 31 22 19 – Finish Grading.
5. Section 31 23 33.13 – Trenching for Site Utilities.

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM):
   1. ASTM C 32, Specification for Sewer and Manhole Brick (made from Clay or Shale).
   2. ASTM C 33, Specification for Concrete Aggregates.
   4. ASTM C 478, Specification for Precast Reinforced Concrete Manhole Sections.

B. Commonwealth of Pennsylvania Department of Transportation (PENNDOT), Specifications Publication 408, as supplemented.
   1. PENNDOT Section 703.3 Select Granular Material (2RC).

C. National Fire Protection Association (NFPA):

1.4 QUALITY ASSURANCE

A. Experience: Demolition contractor shall demonstrate a minimum of five years experience on similar projects.
B. Regulatory Requirements:
2. 29 CFR 1910 – Occupational Safety and Health Standards.

C. Other Requirements: Comply with the proposed Health and Safety Plan and Work Plan.

D. Safety Meetings: Conduct daily safety meetings.

1.5 SUBMITTALS

A. Documentation
1. Copy of request to utility companies owning or agency controlling services and appurtenances affected by demolition work for discontinuance of services or relocation of services. Submit copies to the owner.

B. Work Plan of proposed procedures for the demolition and removal work. Include a sequence of operations, equipment to be used and name and address of all proposed disposal and recycling facilities.

1.6 PROJECT CONDITIONS

A. Existing Conditions: The information presented on the Drawings is based on visual field examination of the site and review of existing record documents. While the information provided is believed to be correct, no assurance is implied relative to its total completeness or accuracy. Report discrepancies to the Construction Manager before disturbing existing installations.
1. The Drawings are intended to indicate the general nature of the demolition work required. Every facility appurtenant to those items designated for removal may not be indicated. Field verify dimensions, quantity, type material, location, means of anchorages and support, interconnection with other facilities, and other pertinent characteristics of facilities which shall be removed or demolished to accommodate new facilities.
2. The Contractor hereby distinctly agrees that neither the Owner nor the Professional is responsible for the correctness or sufficiency of the information given and after the Contractor’s own Site Investigation:
   a. Shall have no claim for delay or extra compensation or damage against the Owner or the professional on account of the information given.
   b. Shall have no claim for relief from any obligation or responsibility under the Contract with respect to the above stated stipulations.

B. Protection: Exercise care during demolition and removal work to confine demolition operations to facilities as indicated on the Drawings. Physical means and methods used for protection are discretionary; however, assume complete responsibility for replacement and restitution work of whatever nature and at no expense to the Owner.
1. Additionally, if public safety is endangered during progress of demolition work, provide adequate protective measures to protect public pedestrian and vehicular traffic on streets and walkways.
2. Signs, signals, and barricades to conform to requirements of Federal, State, and local laws, rules, regulations, precautions, orders, and decrees.

C. Protection of Existing Improvements: Provide protections necessary to prevent damage to existing improvements indicated to remain in place.

D. Protect improvements of Owner’s property.
E. Restore damaged improvements to their original condition, as acceptable to property Owners and including soil and debris tracked onto existing paving.

F. Traffic: Conduct site-clearing operations to ensure minimum interference with parking, roads, streets, walks, and other adjacent occupied or used facilities. Do not close or obstruct streets, drive, walks, or other occupied or used facilities without permission from the Owner or authorities having jurisdiction.

G. Dust Control: To prevent unnecessary spread of dust during performance of the work of this Section, thoroughly moisten surfaces and debris as required to prevent dust being a nuisance to the public, neighbors, and concurrent performance of other work on the site. Water for use in dust control shall be obtained from Contractor's own source.

H. Explosives and Blasting: Not allowed in performance of demolition work.

I. Environmental Requirements: Maintain soil erosion and sediment control measures as required in Section 31 25 00.

1.7 SEQUENCING AND SCHEDULING

A. Unfinished Work:
   1. Sequence and schedule work with consideration for the stability of the areas of the structure not intended for removal or are intended for removal at a later time.
   2. Provide and secure bracing, shoring, or lateral supports to shore unstable areas created as a result of any cutting, removal, or demolition work.

1.8 PROTECTION OF EXISTING VEGETATION

A. Refer to Section 01 56 39: Temporary Tree and Plant Protection.

1.9 EXISTING SERVICES

A. General: Indicated locations are approximate; determine exact locations before commencing work.

B. Arrange and pay for disconnecting, removing, capping, and plugging utility services. Notify affected utility companies in advance and obtain approval before starting this Work.

C. Place markers to indicate location of disconnected services. Identify service lines and capping locations on Project Record Documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Temporary Materials: Materials needed or required for temporary protection in the form of barricades, fences, enclosures, etc., may be used construction materials of sound condition and reasonably clean. However, the condition of these materials shall meet or exceed the requirements of governing agencies or approving bodies as may be involved with the work.

B. Equipment: Equipment, machinery and apparatus (motorized or otherwise) used to perform the demolition and removal work may be used as chosen at the Contractor's discretion, but which will perform the work within the limits of the Contract requirements.
1. Select Earth Backfill: On site excavated material free of plant life, lumber, metal, refuse and rocks or similar hard objects larger than three inches in any dimension.

2. Aggregate Backfill: Conforming to PENNDOT Type 2A Section 703.2.

3. Sand: Natural or manufactured sand conforming to ASTM C 33.

4. Concrete: Class B (3000 psi) as specified in Section 03 30 53 – Miscellanous Cast-in-Place Concrete.

5. Lean Concrete: 2000 psi compressive strength at 28 days with minimum cement content per cubic yard in accordance with current ready-mix plant standard practice.
   a. Reduced Aggregate: Aggregate with particle size not less than 1/8-inch or more than 1/2-inch in any dimension and a maximum of five percent of the particles passing a No. 8 sieve.

6. Pipe Plug Materials: Where existing storm or sanitary piping is being abandoned in place construct pipe plugs in the open ends of such pipe using the following materials:
   a. Manhole Brick: Commercially manufactured brick made from clay or shale and burned, conforming to ASTM C 32, Grade MS.
   b. Waterproofed Mortar: Conforming to requirements of ASTM C 270 for Type M, 2500 psi. Parts by volume include: One part cement, 1/4 part lime, and sand at not less than 2½ nor more than 3 times the sum of the volumes of cement and lime used and of the following materials:
      1) Waterproofing Agent: Medusa Waterproofing Powder by Medusa Portland Cement Co.; Hydratite by Grace Construction Materials; or Hydrolox by Chem-Master Corp. Add the Medusa product in the ratio of two pounds per bag of cement; add the other products per manufacturer’s recommendations.
      2) Portland Cement: Conforming to ASTM C 150, Type I.
      3) Hydrated Lime: Conforming to ASTM C 207, Type S.
      4) Sand: Conforming to ASTM C 144.
      5) Water: Clean and free from deleterious amounts of acids, alkalis, and organic materials.

7. All required plugs, caps, flanges and other items required for disconnected utilities shall be approved by the appropriate utility companies.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS:

A. The means and methods of performing demolition (and removal) operations are the sole responsibility of the Contractor.

3.2 EXAMINATION

A. Field Inspection: Prior to performance of the actual work, carefully inspect the sites of the indicated and annotated demolition work and locate those objects, structures, and partitions designated to be demolished and removed.
   1. Verify with the Engineer the objects, structures, and partitions to be demolished and removed.
   2. Subsurface conditions
      a. Any available data concerning subsurface materials or conditions has been obtained by the retained Engineer for its own use in designing this project. Its accuracy or completeness is not guaranteed by the Owner or the Engineer and in no event is it to be considered as part of the contract plans or specifications.
Contractors must assume all risks in excavating for this project and shall not be entitled to rely on any subsurface information obtained from the retained Engineer. Bidders shall therefore make their own investigation of existing subsurface conditions and if they do not do so, the Owner will not be responsible in any way for the consequences. Said subsurface information is available at the office of Engineer. Bidders will be required to sign a standard form of receipt for this subsurface information; and such bidders accept such subsurface information in accord with the provisions of this section.

b. The contract drawings show information obtained by the Engineer regarding the location of pipes, conduits, storm sewers and other structures which exist along the lines of work below the surface of the ground. This information is shown for the convenience of the Contractor who must verify in advance the information given to his own satisfaction. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, notify the Engineer immediately. Cooperate with the Owner and utility companies in keeping their respective services and facilities in operation. Repair damaged utilities to the satisfaction of the utility owner. Do not interrupt existing utilities servicing facilities occupied or those being used except when services have been provided. No extras will be paid for additional utilities encountered or utilities shown in the wrong location.

B. Utilities: Locate existing exposed and buried active utilities and determine the requirement for their protection, or their disposition with respect to the demolition work.
1. Electrical: Disconnect or de-energize on-site electrical wiring close to or entering structures to be demolished. Coordinate with the Pennsylvania State University for necessary relocation of utilities.
2. Water: Disconnect or cap on-site water lines close to or entering structures to be demolished. Protect existing fire control hydrants and repair damaged hydrants. Coordinate with the Pennsylvania State University for necessary relocation of utilities.
3. Sanitary and Storm Sewers: Disconnect or cap sanitary sewers and storm drains close to or exiting structures to be demolished.
4. Coordinate all utility relocation with the Owner and utility company. Cap all utilities in a location approved by the Owner. Use approved cap materials.

C. Exterior Dust Control: To minimize unnecessary spread of dust during performance of exterior demolition work, thoroughly moisten surfaces and debris as required to prevent dust being a nuisance to the public, neighbors, and concurrent performance of other work on the site. Water for use in dust control shall be obtained from Contractor’s own source and shall be potable water.

D. Protection of Public:
1. If public safety could be endangered during the progress of the demolition work, provide adequate protective measures to protect public pedestrian and vehicular traffic on streets and walkways.
2. Signs, signals, and barricades used shall conform to requirements of Federal, State and local laws, rules, regulations, precautions, orders, and decrees.

E. Explosives and Blasting: Not allowed in performance of demolition work.

F. Asbestos: Cease work immediately and notify the Engineer if suspected asbestos is encountered that has not been previously identified.

G. Remediation: Conduct required remediation prior to commencing with work. If contaminated materials are encountered that have not been previously identified, cease work immediately, and notify Engineer.
H. Clearing: Clear vegetation only as necessary to complete work. Additional clearing not required to complete the work shall be as approved by the Owner.

3.3 PERFORMANCE

A. Arrange and pay for disconnecting, removing, capping, and plugging utility services. Notify affected utility companies in advance and obtain approval before starting this Work.

B. Place markers to indicate location of disconnected services. Identify service lines and capping locations on Project Record Documents.

C. General Requirements: The means and methods of performing demolition and removal operations are the sole responsibility of the Contractor. However, equipment used, and methods of demolition and removal will be subject to approval of The Owner and Engineer.
   1. When removing concrete slabs, saw cut such slabs at the limits of removal to assure a smooth, uniform joint with new concrete installation.
   2. When removing masonry, remove to the next full size unit so proper toothing in of new work may be done.
   3. Perform removal of masonry and concrete debris, keeping such debris dampened during removal.

D. Excavation and Backfilling: Perform work in accordance with the requirements of Sections 03 20 00, 31 22 00, and 31 23 33.13.
   1. Should the Contractor, in demolishing or removing existing facilities, such as existing pipelines, excavate below the subgrade for new facilities, he will be required to backfill the area excavated below the subgrade with Aggregate Backfill, at no increase in Contract Price.
   2. Backfill substructure cavities using Select Earth Backfill. Restore surfaces in the area of demolished structures to match the surrounding area.

E. Salvage: The Owner has the right to claim as salvage any of the materials and equipment removed under the work of this Section.
   1. Existing removed materials and equipment not claimed as salvage by the Owner shall become the property of the Contractor and be disposed of in a lawful manner off site.

F. Substructure Penetrations: As a general practice in the demolition work, and to prevent the future accumulation of water in the remaining portions of below grade structures after backfilling operations, break through the bottoms of such structures to the extent that water drainage readily occurs.

G. Abandoned Equipment and Machinery: Existing equipment and machinery in or on the structures, not claimed as salvage by the Owner, shall also become the property of the Contractor and shall be removed and disposed of in a lawful manner off site.

H. Capping Existing Facilities:
   1. Cap cut ends of water mains to be abandoned.
   2. Close existing corporation stops on water services to be abandoned except those on abandoned mains.

I. Removal and Filling Existing Valve Boxes:
   1. Remove top section of valve boxes indicated to be abandoned.
   2. Fill with aggregate backfill in layers not to exceed six inches in depth after compaction.
      a. Perform compaction by hand.
      b. Puddling or jetting compacting methods are not permitted.
J. Plugging Existing Pipelines: Provide watertight seals by constructing pipe plugs in the open ends of pipelines being abandoned in place. Use Manhole Brick and Waterproofed Mortar to construct the pipe plugs.

K. Plugging Existing Facilities: Provide watertight seals using Class B concrete. For large openings use Manhole Brick and Waterproofed Mortar.
   1. Plug openings in manholes that are to be abandoned or filled.
   2. Plug the ends of pipe sewers that are to be abandoned or filled.

L. Filling Manholes to be Abandoned: Remove the cone or tapered section of the manhole and fill the manhole cavity with Select Earth Backfill placed in layers not to exceed 6-inches in depth after compaction.
   1. Perform compaction with vibratory type compactor. Puddling or jetting compaction methods are not allowed.
   2. Fill manholes to subgrade of the temporary or permanent replacement paving or to the elevation of the adjacent surfaces.
   3. Crown the top surfaces of the Select Earth Backfill in unpaved areas to such heights as required by the Construction Manager.

M. Filling Sewers to be Abandoned: Fill abandoned sewers with Lean Concrete.

N. Structure Foundations: Remove all structure foundations entirely and backfill with Select Earth Backfill.

3.4 REPAIR/RESTORATION

A. General Requirements: At Contractor’s expense, repair or replace damaged structures, appurtenances, and vegetation not specified for removal.

B. Excavation and Fill: Fill pits and voids created by the work in accordance with Section 312000.

3.5 FIELD QUALITY CONTROL

A. Engineers Observation: Completely remove demolition debris from the site. Obtain approval from the Engineer prior to commencing with next phase of work.

3.6 CLEANING

A. Debris: Remove or store debris daily to prevent accumulation. Disposal of debris shall be conducted in a lawful manner.

B. Final Cleaning: Clean and restore work areas to the pre-work condition or better.

3.7 PROTECTION

A. Removal: Protect structures, site areas, and vegetation not designated for removal from damage during work.

B. Demolition: Protect existing utilities not scheduled for demolition.

3.8 SITE CLEARING

A. General: Remove trees, shrubs, grass, and other vegetation, improvements, or obstructions, as required, to permit installation of new construction. Remove similar items elsewhere on site or
premises as specifically indicated. Removal includes digging out and off-site disposal of stumps and roots.

B. Where existing trees are indicated to remain, leave existing topsoil in place within drip lines to prevent damage to root system.

C. Clearing and Grubbing: Clear site of trees, shrubs, and other vegetation, except for those indicated to be left standing.
   1. Completely remove stumps, roots, and other debris protruding through ground surface.
   2. Use only hand methods for grubbing inside drip line of trees indicated to remain.
   3. Fill depressions caused by clearing and grubbing operations with satisfactory soil material, unless further excavation or earthwork is indicated.
   4. Place fill material in horizontal layers not exceeding 6 inches loose depth, and thoroughly compact each layer to a density of 100 percent of the maximum dry density under building, walkway, and pavement footprints and do not compact in planting areas.

D. Demolition and Removal of Improvements: Remove existing above-grade and below-grade improvements as indicated and as necessary to facilitate new construction.
   1. Saw cut edges of existing bituminous and concrete paving to be removed. Saw cuts are to be straight and clean.
   2. Demolish and remove all indicated existing site structures, such as footings, curbs, and foundation walls, completely.
   3. Demolish and remove all indicated existing walks completely to subgrade.
   4. Demolish and remove all indicated bituminous concrete paving and curbs completely to subgrade.

E. Abandonment or removal of certain underground pipe or conduits is indicated on demolition and site preparation plan. Remove abandoned underground piping or conduits interfering with construction as indicated on the plans.

END OF SECTION 02 41 00
SECTION 02 41 16 - STRUCTURE DEMOLITION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Demolition and removal of buildings and site improvements.
2. Removing below-grade construction.
3. Disconnecting, capping or sealing, and abandoning in-place of removing site utilities.
4. Salvage of existing face brick for reuse in construction.

B. Related Sections:

1. Division 01 Section "Summary" for use of the premises and phasing requirements.
2. Division 01 Section "Construction Progress Documentation" for preconstruction photographs taken before building demolition.
3. Division 01 Section "Construction Waste Management and Disposal."
4. Division 02 Section "Selective Structure Demolition" for partial demolition of buildings, structures, and site improvements.
5. Division 23 Sections for demolishing or relocating site mechanical items.
6. Division 31 Section "Site Clearing" for site clearing and removal of above- and below-grade site improvements not part of building demolition.
7. Division 33 Section "Utility Relocation" for shutting off, disconnecting, removing, and sealing or capping utilities.

1.3 DEFINITIONS

A. Remove: Detach items from existing construction and legally dispose of them off-site unless indicated to be removed and salvaged.

B. Remove and Salvage: Carefully detach from existing construction, in a manner to prevent damage.

1.4 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.
1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified refrigerant recovery technician.

B. Proposed Protection Measures: Submit informational report, including Drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and, for noise control. Indicate proposed locations and construction of barriers.
   1. Adjacent Buildings: Detail special measures proposed to protect adjacent buildings to remain including means of egress from those buildings.

C. Schedule of Building Demolition Activities: Indicate the following:
   1. Detailed sequence of demolition work, with starting and ending dates for each activity.
   2. Temporary interruption of utility services.
   3. Shutoff and capping or re-routing of utility services.

D. Inventory: Submit a list of items to be removed and salvaged and deliver to Owner prior to start of demolition.

E. Predemolition Photographs: Show existing conditions of adjoining construction and site improvements, including finish surfaces, that might be misconstrued as damage caused by demolition operations. Comply with Division 01 Section "Photographic Documentation." Submit before the Work begins.

F. Landfill Records: Indicate receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.

G. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

1.6 QUALITY ASSURANCE

A. Refrigerant Recovery Technician Qualifications: Certified by EPA-approved certification program.

B. Regulatory Requirements: Comply with governing EPA notification regulations before beginning demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

D. Predemolition Conference: Conduct conference at Project site.
   1. Inspect and discuss condition of construction to be demolished.
   2. Review structural load limitations of existing structures.
   3. Review and finalize building demolition schedule and verify availability of demolition personnel, equipment, and facilities needed to make progress and avoid delays.
   4. Review and finalize protection requirements.
   5. Review procedures for noise control and dust control.
   6. Review procedures for protection of adjacent buildings.
1.7 OWNER’S REQUIREMENTS

A. All requirements listed below will be strictly enforced and supercede more general requirements included in referenced sections of this specification.

B. Demolition Contractor Prequalification - All structural / facility demolition bidders must be prequalified by PSU. See requirements on OPP website at: http://www.opp.psu.edu/planning-construction/contractor-prequalification-information.

C. PA DEP and US EPA Demolition Notifications - Demolition contractor, not general contractor, is responsible for completion and submittal. Draft forms are to be submitted to PSU EHS for review and approval prior to mailing to appropriate regulatory agencies. After approval from EHS, the demolition contractor shall submit to appropriate agencies and provide signed copies to EHS the same day, with proof-of-mailing. Demolition shall not begin until 10-working days after the approved notification is post-marked.

D. Site Fence within Primary Construction Enclosure - Shall be 8’ high cyclone wire or equivalent with hammered-in posts. Free standing fences are not permitted unless temporary for short duration operations. EHS approval for temporary free standing fence must be granted in advance.

E. Wetting and Dust Control - Demolition contractor is responsible for wetting debris from time of first contact until placing into appropriate waste or hauling containers or trucks. Debris shall not be allowed to dry before removal from site. Visible airborne dust is not permitted.

F. Wetting and Dust Control - Demolition contractor is responsible for providing water tank / pump trucks if on-site water flow or pressure is not sufficient for operations.

G. Asbestos - Every effort has been made to identify and remove all asbestos from the facility prior to demolition. If suspect asbestos is discovered cease operations and notify OPP and EHS immediately.

H. Contaminated Soil - If unusual stains or odors are detected in soils, cease demolition or excavation operations and notify OPP and EHS immediately.

I. Lead Paint and Clean Fill - All painted CMU, brick or concrete must be disposed as demolition debris at a PA DEP licensed landfill. These materials contain lead-based paint and cannot be reused on PSU or any other non-PSU sites.

J. Salvage of Painted Materials - Salvage of painted materials such as doors, windows, frames, moldings, etc. must be coordinated with EHS. End users of these materials must be provided with a Lead Paint Notification / Disclaimer before removing from PSU property.

1.8 PROJECT CONDITIONS

A. Buildings to be demolished will be vacated and their use discontinued before start of the Work.

B. Buildings immediately adjacent to demolition area will be occupied. Conduct building demolition so operations of occupied buildings will not be disrupted.

1. Provide not less than 72 hours’ notice of activities that will affect operations of adjacent occupied buildings.

2. Maintain access to existing walkways, exits, and other facilities used by occupants of adjacent buildings.

   a. Do not close or obstruct walkways, exits, or other facilities used by occupants of adjacent buildings without written permission from authorities having jurisdiction.
C. Owner assumes no responsibility for buildings and structures to be demolished.
   1. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

D. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.
   1. Hazardous materials will be removed by Owner before start of the Work.
   2. If materials suspected of containing hazardous materials are encountered, do not disturb; immediately notify Architect and Owner. Hazardous materials will be removed by Owner under a separate contract.

E. On-site storage or sale of removed items or materials is not permitted.

1.9 COORDINATION
   A. Arrange demolition schedule so as not to interfere with Owner's on-site operations or operations of adjacent occupied buildings.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS
   A. Satisfactory Soils: Comply with requirements in Division 31 Section "Earth Moving."

PART 3 - EXECUTION

3.1 EXAMINATION
   A. Verify that utilities have been disconnected and capped before starting demolition operations.
   B. Review Project Record Documents of existing construction provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in Project Record Documents.
   C. Inventory and record the condition of items to be removed and salvaged. Provide photographs of conditions that might be misconstrued as damage caused by salvage operations. Comply with Division 01 Section "Photographic Documentation."
   D. Perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during building demolition operations.

3.2 PREPARATION
   A. Refrigerant: Remove refrigerant from mechanical equipment according to 40 CFR 82 and regulations of authorities having jurisdiction before starting demolition.
   B. Existing Utilities: See Divisions 22 and 26 Sections for shutting off, disconnecting, removing, and sealing or capping utilities. Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing.
C. Temporary Shoring: Provide and maintain interior and exterior shoring, bracing, or structural support to preserve stability and prevent unexpected movement or collapse of construction being demolished.

1. Strengthen or add new supports when required during progress of demolition.

3.3 PROTECTION

A. Existing Facilities: Protect adjacent walkways, loading docks, building entries, and other building facilities during demolition operations. Maintain exits from existing buildings.

B. Existing Utilities: Maintain utility services to remain and protect from damage during demolition operations.

1. Do not interrupt existing utilities serving adjacent occupied or operating facilities unless authorized in writing by Owner and authorities having jurisdiction.
2. Provide temporary services during interruptions to existing utilities, as acceptable to Owner and authorities having jurisdiction.
   a. Provide at least 72 hours' notice to occupants of affected buildings if shutdown of service is required during changeover.

C. Temporary Protection: Erect temporary protection, such as walks, fences, railings, canopies, and covered passageways, where required by authorities having jurisdiction and as indicated. Comply with requirements in Division 01 Section "Temporary Facilities And Controls."

1. Protect adjacent buildings and facilities from damage due to demolition activities.
2. Protect existing site improvements, appurtenances, and landscaping to remain.
3. Erect a plainly visible fence around drip line of individual trees or around perimeter drip line of groups of trees to remain.
4. Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
5. Provide protection to ensure safe passage of people around building demolition area and to and from occupied portions of adjacent buildings and structures.
6. Protect walls, windows, roofs, and other adjacent exterior construction that are to remain and that are exposed to building demolition operations.
7. Erect and maintain dustproof partitions and temporary enclosures to limit dust, noise, and dirt migration to occupied portions of adjacent buildings.

D. Remove temporary barriers and protections where hazards no longer exist. Where open excavations or other hazardous conditions remain, leave temporary barriers and protections in place.

3.4 DEMOLITION, GENERAL

A. General: Demolish indicated buildings and site improvements completely. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Do not use cutting torches until work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations.
2. Maintain fire watch during and for at least 8 hours after flame cutting operations.
3. Maintain adequate ventilation when using cutting torches.
4. Locate building demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
B. Engineering Surveys: During demolition, perform surveys to detect hazards that may result from building demolition activities.

C. Site Access and Temporary Controls: Conduct building demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Do not close or obstruct streets, walks, walkways, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.

2. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.

D. Explosives: Use of explosives is not permitted.

3.5 DEMOLITION BY MECHANICAL MEANS

A. Proceed with demolition of structural framing members systematically, from higher to lower level. Complete building demolition operations above each floor or tier before disturbing supporting members on the next lower level.

B. Remove debris from elevated portions of the building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.

1. Remove structural framing members and lower to ground by method suitable to minimize ground impact and dust generation.

2. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, then remove masonry between saw cuts.

   a. Carefully remove existing face brick to be reused or replaced as indicated on Drawings.

   b. Carefully remove existing limestone trim to be reused or replaced as indicated on the Drawings.

C. Below-Grade Construction: Demolish foundation walls and other below-grade construction.

1. Remove below-grade construction, including basements, foundation walls, and footings, completely.

2. Take care to preserve and protect adjacent utilities that are not part of this project and are not scheduled for removal.

D. Existing Utilities: Demolish existing utilities and below-grade utility structures that are within 5 feet outside footprint indicated for new construction. Abandon utilities outside this area.

1. Fill abandoned utility structures with approved material according to backfill requirements in Division 31 Section "Earth Moving."

2. Piping: Disconnect piping at unions, flanges, valves, or fittings.

3. Wiring Ducts: Disassemble into unit lengths and remove plug-in and disconnecting devices.
3.6 SITE RESTORATION

A. Below-Grade Areas: Rough grade below-grade areas ready for further excavation or new construction.

B. Site Grading: Uniformly rough grade area of demolished construction to a smooth surface, free from irregular surface changes. Provide a smooth transition between adjacent existing grades and new grades.

3.7 REPAIRS

A. Promptly repair damage to adjacent buildings caused by demolition operations.

3.8 DISPOSAL OF DEMOLISHED MATERIALS

A. Remove demolition waste materials from Project site and legally dispose of them in an EPA-approved landfill acceptable to authorities having jurisdiction. See Division 01 Section "Construction Waste Management and Disposal" for recycling and disposal of demolition waste.

   1. Do not allow demolished materials to accumulate on-site.
   2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.

B. Do not burn demolished materials.

3.9 CLEANING

A. Clean adjacent structures and improvements of dust, dirt, and debris caused by building demolition operations. Return adjacent areas to condition existing before building demolition operations began.

   1. Clean roadways of debris caused by debris transport.

END OF SECTION 02 41 16
SECTION 02 41 19 - SELECTIVE STRUCTURE DEMOLITION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Demolition and removal of selected portions of building or structure.
   2. Salvage of existing face bricks for reuse in reconstruction.

B. Related Requirements:
   1. Division 01 Section "Summary" for restrictions on the use of the premises, Owner-occupancy requirements, and phasing requirements.
   2. Division 01 Section "Construction Waste Management and Disposal."
   3. Division 01 Section "Temporary Tree and Plant Protection" for temporary protection of existing trees and plants that are affected by selective demolition.
   4. Division 01 Section "Execution" for cutting and patching procedures.
   5. Division 02 Section "Structure Demolition" for demolition and removal of buildings and site improvements.
   6. Division 31 Section "Site Clearing" for site clearing and removal of above- and below-grade improvements.

1.3 DEFINITIONS

A. Remove: Detach items from existing construction and legally dispose of them off-site unless indicated to be removed and salvaged or removed and reinstalled.

B. Remove and Salvage: Carefully detach from existing construction, in a manner to prevent damage, and deliver to Owner.

C. Remove and Reinstall: Detach items from existing construction, prepare for reuse, and reinstall where indicated.

D. Existing to Remain: Existing items of construction that are not to be permanently removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

1.4 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of Contractor.
B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.5 PREINSTALLATION MEETINGS

A. Predemolition Conference: Conduct conference at Project site.

1. Inspect and discuss condition of construction to be selectively demolished.
2. Review structural load limitations of existing structure.
3. Review and finalize selective demolition schedule and verify availability of materials, demolition personnel, equipment, and facilities needed to make progress and avoid delays.
4. Review requirements of work performed by other trades that rely on substrates exposed by selective demolition operations.
5. Review areas where existing construction is to remain and requires protection.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For refrigerant recovery technician and demolition engineer.

B. Proposed Protection Measures: Submit report, including drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and, for noise control. Indicate proposed locations and construction of barriers.

C. Schedule of Selective Demolition Activities: Indicate the following:

1. Detailed sequence of selective demolition and removal work, with starting and ending dates for each activity. Ensure Owner's on-site operations are uninterrupted.
2. Interruption of utility services. Indicate how long utility services will be interrupted.
3. Coordination for shutoff, capping, and continuation of utility services.
4. Use of elevator and stairs.
5. Coordination of Owner's continuing occupancy of portions of existing building and of Owner's partial occupancy of completed Work.

D. Inventory: Submit a list of items to be removed and salvaged and deliver to Owner prior to start of demolition.

E. Predemolition Photographs or Video: Submit before Work begins.

F. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

G. Warranties: Documentation indicated that existing warranties are still in effect after completion of selective demolition.

1.7 CLOSEOUT SUBMITTALS

A. Inventory: Submit a list of items that have been removed and salvaged.
B. Landfill Records: Indicate receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.

1.8 QUALITY ASSURANCE

A. Refrigerant Recovery Technician Qualifications: Certified by an EPA-approved certification program.

1.9 OWNER’S REQUIREMENTS

A. All requirements listed below will be strictly enforced and supercede more general requirements included in referenced sections of this specification.

B. Demolition Contractor Prequalification - All structural / facility demolition bidders must be prequalified by PSU. See requirements on OPP website at: http://www.opp.psu.edu/planning-construction/contractor-prequalification-information.

C. PA DEP and US EPA Demolition Notifications - Demolition contractor, not general contractor, is responsible for completion and submittal. Draft forms are to be submitted to PSU EHS for review and approval prior to mailing to appropriate regulatory agencies. After approval from EHS, the demolition contractor shall submit to appropriate agencies and provide signed copies to EHS the same day, with proof-of-mailing. Demolition shall not begin until 10-working days after the approved notification is post-marked.

D. Site Fence within Primary Construction Enclosure - Shall be 8' high cyclone wire or equivalent with hammered-in posts. Free standing fences are not permitted unless temporary for short duration operations. EHS approval for temporary free standing fence must be granted in advance.

E. Wetting and Dust Control - Demolition contractor is responsible for wetting debris from time of first contact until placing into appropriate waste or hauling containers or trucks. Debris shall not be allowed to dry before removal from site. Visible airborne dust is not permitted.

F. Wetting and Dust Control - Demolition contractor is responsible for providing water tank / pump trucks if on-site water flow or pressure is not sufficient for operations.

G. Asbestos - Every effort has been made to identify and remove all asbestos from the facility prior to demolition. If suspect asbestos is discovered cease operations and notify OPP and EHS immediately.

H. Contaminated Soil - If unusual stains or odors are detected in soils, cease demolition or excavation operations and notify OPP and EHS immediately.

I. Lead Paint and Clean Fill - All painted CMU, brick or concrete must be disposed as demolition debris at a PA DEP licensed landfill. These materials contain lead-based paint and cannot be reused on PSU or any other non-PSU sites.

J. Salvage of Painted Materials - Salvage of painted materials such as doors, windows, frames, moldings, etc. must be coordinated with EHS. End users of these materials must be provided with a Lead Paint Notification / Disclaimer before removing from PSU property.

1.10 FIELD CONDITIONS

A. Owner will occupy portions of building immediately adjacent to selective demolition area. Conduct selective demolition so Owner's operations will not be disrupted.
1. The area slated for selective demolition is presently occupied space. The Owner will have to temporarily relocate departments so that work in this area can take place. Therefore, work must be carefully scheduled and coordinated with Owner.

B. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical.

C. Notify Architect of discrepancies between existing conditions and Drawings before proceeding with selective demolition.

D. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.
   
   1. Hazardous materials will be removed by Owner before start of the Work.
   2. If suspected hazardous materials are encountered, do not disturb; immediately notify Architect and Owner. Hazardous materials will be removed by Owner under a separate contract.

E. Storage or sale of removed items or materials on-site is not permitted.

F. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.
   
   1. Maintain fire-protection facilities in service during selective demolition operations.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ANSI/ASSE A10.6 and NFPA 241.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Review record documents of existing construction provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in record documents.

C. Survey existing conditions and correlate with requirements indicated to determine extent of selective demolition required.

D. When unanticipated mechanical, electrical, or structural elements that conflict with intended function or design are encountered, investigate and measure the nature and extent of conflict. Promptly submit a written report to Architect.
E. Engage a professional engineer to perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during selective building demolition operations.

1. Perform surveys as the Work progresses to detect hazards resulting from selective demolition activities.

F. Survey of Existing Conditions: Record existing conditions by use of preconstruction photographs.

1. Comply with requirements specified in Division 01 Section "Photographic Documentation."
2. Inventory and record the condition of items to be removed and salvaged. Provide photographs of conditions that might be misconstrued as damage caused by salvage operations.
3. Before selective demolition or removal of existing building elements that will be reproduced or duplicated in final Work, make permanent record of measurements, materials, and construction details required to make exact reproduction.

3.2 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

1. Comply with requirements for existing services/systems interruptions specified in Division 01 Section "Summary."

B. Existing Services/Systems to Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off indicated utility services and mechanical/electrical systems serving areas to be selectively demolished.

1. Owner will arrange to shut off indicated services/systems when requested by Contractor.
2. Arrange to shut off indicated utilities with utility companies.
3. If services/systems are required to be removed, relocated, or abandoned, provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building.
4. Disconnect, demolish, and remove fire-suppression systems, plumbing, and HVAC systems, equipment, and components indicated to be removed.

   a. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
   b. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.
   c. Equipment to Be Removed: Disconnect and cap services and remove equipment.
   d. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
   e. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.
   f. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
   g. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material.

C. Refrigerant: Remove refrigerant from mechanical equipment to be selectively demolished according to 40 CFR 82 and regulations of authorities having jurisdiction.
3.3 PREPARATION

A. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Comply with requirements for access and protection specified in Division 01 Section "Temporary Facilities and Controls."

B. Temporary Facilities: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.

1. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
2. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.
3. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
4. Cover and protect furniture, furnishings, and equipment that have not been removed.
5. Comply with requirements for temporary enclosures, dust control, heating, and cooling specified in Division 01 Section "Temporary Facilities and Controls."

C. Temporary Shoring: Provide and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.

1. Strengthen or add new supports when required during progress of selective demolition.

3.4 SELECTIVE DEMOLITION, GENERAL

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Proceed with selective demolition systematically, from higher to lower level. Complete selective demolition operations above each floor or tier before disturbing supporting members on the next lower level.
2. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping, to minimize disturbance of adjacent surfaces. Temporarily cover openings to remain.
3. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
4. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain fire watch and portable fire-suppression devices during flame-cutting operations.
5. Maintain adequate ventilation when using cutting torches.
6. Remove decayed, vermin-infested, or otherwise dangerous or unsuitable materials and promptly dispose of off-site.
7. Remove structural framing members and lower to ground by method suitable to avoid free fall and to prevent ground impact or dust generation.
8. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
9. Dispose of demolished items and materials promptly. Comply with requirements in Division 01 Section "Construction Waste Management and Disposal."

B. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Architect, items may be removed to a suitable, protected storage location during selective demolition and cleaned and reinstalled in their original locations after selective demolition operations are complete.

3.5 SELECTIVE DEMOLITION PROCEDURES FOR SPECIFIC MATERIALS

A. Concrete: Demolish in sections. Cut concrete full depth at junctures with construction to remain and at regular intervals using power-driven saw, then remove concrete between saw cuts.

B. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, then remove masonry between saw cuts.

1. Carefully remove existing face brick to be reused or replaced as indicated on the Drawings.
2. Carefully remove existing limestone trim to be reused or replaced as indicated on the Drawings.

C. Concrete Slabs-on-Grade: Saw-cut perimeter of area to be demolished, then break up and remove.

D. Resilient Floor Coverings: Remove floor coverings and adhesive according to recommendations in RFCI's "Recommended Work Practices for the Removal of Resilient Floor Coverings." Do not use methods requiring solvent-based adhesive strippers.

3.6 DISPOSAL OF DEMOLISHED MATERIALS

A. General: Except for items or materials indicated to be recycled, reused, salvaged, reinstalled, or otherwise indicated to remain Owner's property, remove demolished materials from Project site and legally dispose of them in an EPA-approved landfill.

1. Do not allow demolished materials to accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
3. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
4. Comply with requirements specified in Division 01 Section "Construction Waste Management and Disposal."

B. Burning: Do not burn demolished materials.

C. Disposal: Transport demolished materials off Owner's property and legally dispose of them.

3.7 CLEANING

A. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

END OF SECTION 02 41 19
SECTION 02 57 00 - SINKHOLE REMEDIATION [C]

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Requirements for excavating sinkholes and the subsequent treatment of such sinkholes.

B. Related Sections:
   1. Submittal Procedures: Applicable Division 1 specification section.

C. Measurement Procedures: The sinkhole treatment work performed will be measured as described in the General Conditions to determine the actual quantity of work included under this Section.

D. Payment Procedures: Actual sinkhole treatment work will be paid for as described in the General Conditions for the actual amount of work performed.
   1. Sinkhole remediation, if required, will be compensated based on the approved Contractor’s time and material proposal for this work. No additional payments will be made for difficulties encountered during excavation or handling of materials. [C]

1.2 REFERENCES

A. American Society for Testing and Materials (ASTM):
   2. ASTM D 698, Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft·lbf/ft3 (600 kN·m/m3)).
   3. ASTM D 2487, Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System).
   5. ASTM D 5034, Standard Test Method for Breaking Strength and Elongation of Textile Fabrics (Grab Test).

B. American Association of State Highway and Transportation Officials (AASHTO):
   1. Standard Specifications for Transportation Materials and Methods of Testing and Sampling:
      a. AASHTO M 6, Fine Aggregate for Portland Cement Concrete.
      b. AASHTO M 295, Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete.

1.3 DEFINITIONS

A. Sinkhole: An area displaying evidence of existing or impending soil transport into openings, voids, or other avenues within bedrock and/or overburden, as determined by the Engineer.

B. Sinkhole Treatment: The location, exposure, cleaning, and plugging of sinkhole related openings, voids, or other avenues of soil transport performed as directed by the Engineer.
1.4 SUBMITTALS

A. Prior to the start of the work of this Section, submit the following information in accordance with the requirements of Section 01 33 00:

1. Product Data:
   a. Geotextiles.

2. Samples: Submit a one-foot square sample and a data sheet giving the results of the required testing for each of the following:
   a. Geotextiles.

3. Quality Assurance/Control Submittals:
   a. Mix designs:
      1) Concrete.
      2) Grout.
   b. Test Reports:
      1) Aggregate test reports.
      2) Concrete unconfined compressive strength test results.
      3) Grout unconfined compressive strength test results.

B. After the start of the work of this Section, submit the following information in accordance with the requirements of the applicable Division 1 specification section for Submittals.

1. Test Reports:
   a. Submit laboratory and field compaction test reports based on the methods specified under Reference Standards and as approved by the Engineer.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements:

1. Perform all work in compliance with the rules and regulations of any governmental agencies having jurisdiction.

1.6 PROJECT CONDITIONS

A. Classification of Excavated Materials: No consideration will be given to the nature of materials encountered during sinkhole treatment operations.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Concrete:

1. Provide a mixture of aggregate, Portland Cement, and water exhibiting a 28-day strength of at least 2000 psi.

2. Submit mix proportions of the concrete to the Engineer for approval.

B. Cement:

1. Provide cement conforming to the requirements of ASTM C 150, Type I or II.

C. Grout:

1. Provide a mixture of Portland cement, fine aggregate, flyash, and water exhibiting a 28-day strength of no more than 250 psi.

2. Submit mix proportions of the grout to the Engineer for approval.

D. Fine Aggregate:
1. Provide aggregate conforming to AASHTO M 6, or as approved by the Engineer.

E. Flyash:
1. Provide flyash meeting the requirements of AASHTO M 295, Type C or F, with a maximum Loss on Ignition of 5 percent.

F. Aggregate Backfill:
1. Provide one or more aggregates of the following types as directed by the Engineer:
   a. AASHTO #1.
   b. PENNDOT 2A.
   c. Rip Rap.

2.2 SOURCE QUALITY CONTROL

A. All materials specified in this Section require advance examination and testing according to the methods and standards referenced, or as required by the Engineer.
1. Furnish two copies of test reports to the Engineer certifying test results.
   a. These test reports may serve as the basis for acceptance or rejection of proposed materials.
2. The Engineer reserves the right to accept materials based on certification from suppliers that the material originates from an approved or accredited source and that the material complies with specified requirements.

PART 3 - EXECUTION

3.1 PREPARATION

A. Initiating Work: Begin sinkhole treatment at the direction of the Engineer, who will designate the areas to be treated.

B. Exposing the Sinkhole: Excavate soft, loose, or unstable material from the sinkhole area to the limits determined by the Engineer.

C. Cleaning Exposed Rock Surfaces:
1. Clean rock surfaces designated by the Engineer of soil or other deposits to produce a surface suitable for developing a positive concrete bond.
   a. Clean out crevasses and soil seams to a depth at least as great as the width of the feature at the top of rock.

D. Dewatering:
1. When required by the Engineer, provide and operate pumping equipment of suitable type and size to evacuate all water entering the sinkhole from washing operations or other sources.
2. Collection sumps may be required to facilitate dewatering operations, as determined by the Engineer.
E. Temporary Grading: As directed by the Engineer, perform temporary grading adjacent to the sinkhole area(s) to prevent the inflow of surface waters into the sinkhole(s).

3.2 SINKHOLE TREATMENT

A. Geotextile Placement:
   1. Place geotextile on prepared rock, concrete, or soil surfaces as directed by the Engineer.
   2. Maintain a minimum overlap of 2 feet between adjacent Geotextile panels.

B. Aggregate Backfill Placement:
   1. Place aggregate backfill to the limits indicated by the Engineer.
   2. Compact all aggregate backfill using approved methods to not less than 95 percent of the maximum dry density determined in accordance with ASTM D 698.
      a. If aggregate is too coarse to satisfactorily use this method, compact it to non-movement using methods approved by the Engineer.

C. Concrete and Grout Placement:
   1. Place concrete and grout to the limits indicated by the Engineer.
   2. If directed by the Engineer, vibrate concrete and grout thoroughly to penetrate narrow or restricted apertures and completely fill the indicated areas without forming voids or other discontinuities.

D. Low Permeability Backfill Placement:
   1. Place low permeability backfill material to the limits indicated by the Engineer.
   2. Compact backfill material using approved methods to not less than 95 percent of the maximum dry density determined in accordance with ASTM D 698.

E. Surface Grading:
   1. Unless otherwise directed by the Engineer, crown the final ground surface above repair area to provide positive drainage away from the repair, and to accommodate potential future settlement without compromising drainage.
   2. Provide a crown height as directed by the Engineer.

3.3 FIELD QUALITY CONTROL

A. Test the backfill compaction in the field using nuclear density gauge testing in accordance with the methods of ASTM D 2922 or other methods approved by the Engineer, and submit test reports to verify that the compaction meets the specified requirements.

END OF SECTION 02 57 00
SECTION 03 11 00 - CONCRETE FORMING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. This Section covers the concrete formwork for construction of all concrete structures set forth on the Drawings and in these Specifications.

1.2 REFERENCES

A. American Concrete Institute (ACI):
   1. ACI 347, Guide to Formwork for Concrete.

B. U.S. Department of Commerce Product Standards:
   1. PS-1-95, Construction and Industrial Plywood.

C. Western Wood Products Association: Western Lumber Grading Rules 98.

1.3 SUBMITTALS

A. Form Coating: Submit manufacturer's descriptive product data and current specification covering named product.

B. Form Ties: Submit manufacturer's descriptive product data, current specification covering named product.

1.4 QUALITY CONTROL

A. Formwork Design: Provide formwork designed to ensure the tolerances indicated and to include factors pertinent to safety of personnel during construction.
   1. Design formwork in accordance with American Concrete Institute's Guide to Formwork for Concrete, ACI 347, and in accordance with the following:
      a. Design forms and falsework to include assumed values of live load, dead load, weight of moving equipment operated on formwork, temporary construction material, foundation pressures, stresses, lateral stability, and such other factors pertinent to safety of structure during construction.
      b. Design formwork to be readily removable without impact, shock, or damage to cast-in-place concrete surfaces and adjacent construction.

B. Allowable Tolerances: Set and maintain concrete forms within tolerance limits stated in American Concrete Institute's Guide to Formwork for Concrete, ACI 347.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage and Protection:
1. Protect formwork materials before, during, and after erection to ensure acceptable finished concrete work. Also protect in-place materials and work of other trades in connection with concrete work.
2. In event of damage to erected forms, make necessary repairs or replacements prior to concrete pours. Perform such corrective work at no increase in Contract Price.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Lumber:
   1. Form framing, sheathing, struts, braces, and shoring in conformance with WWPA Grading Rules or SPIB Grading Rules.
   2. Rough Structural and Dimension Lumber: Provide lumber of allowable species, surfaced four sides as applicable, and grade stamped with the appropriate WWPA or SPIB stamp indicating product compliance with PS-20-94.
   3. Use lumber free of material defects that would deform the finished concrete product.

B. Plywood:
   1. Form Sheathing and Panels: Not less than 5/8 inch thick Exterior Type B-B Plywood Class I and II conforming to U.S. Product Standard PS-1-95.
   2. Use Class II only on surfaces not exposed to view.

C. Steel:
   1. Metal Forms of a pre-engineered standard design, conforming to the concrete sections indicated on the Drawings, may be used in lieu of wood forms.

D. Form Ties:
   1. Provide factory-fabricated, adjustable-length, removable, or snap-off metal form ties conforming to ACI 347.
      a. Do not fabricate wire ties, flat bands, or form ties on the Site.
   2. Removable Ties:
      a. For ties that are designed to be completely removed, taper the ties over their full length that passes through the concrete.
         1) For building foundation walls where ground is located on one side only, install tapered ties so the large end of the taper is on the ground side of the concrete wall.
      b. Do not use removable ties that leave holes larger than one inch.
   3. Snap-off Metal Ties:
      a. Provide snap-off metal ties with ends that break at least 1½ inches from the face of the wall.
   4. Do not use wood spacers.
   5. Submit Product Data and current specifications for the form tie materials.

E. Form Coatings:
   1. Provide commercial formulation form-coating compounds that do not bond with, stain, or affect concrete surfaces.
      a. Provide form-coating compounds that do not impair subsequent treatment of concrete surfaces requiring bond or adhesion, or impede the wetting of surfaces to be cured with water or curing compounds.
PART 3 - EXECUTION

3.1 INSPECTION

A. Prior to placement of concrete, inspect forms for cleanliness and accuracy of alignment.

3.2 PREPARATION

A. Apply form coatings in accordance with manufacturer’s specifications.
B. Do not allow excess form coating material to accumulate in the forms.
C. Do not allow form coatings to come in contact with construction joints and reinforcing steel.

3.3 ERECTION

A. General: Construct forms in accordance with ACI 347 to required dimensions, plumb, straight, mortar tight, and paste tight where appearance is important.
   1. Securely brace and shore forms to prevent displacement, bowing and pillowing, and to safely support imposed concrete load.
   2. Provide offsets, keyways, recesses, chamfers, blocking, screeds, bulkheads, anchorages and inserts, and such other features as required. Use selected materials to obtain above requirements.
   3. Fabricate forms for easy removal without hammering or prying against concrete surfaces.
   4. Form intersecting planes to provide true, clean-cut corners with edge grain of plywood not exposed to concrete.
   5. Build into forms, or otherwise secure in forms, items such as inserts, anchors, miscellaneous metal items, and such other embedded items as indicated on Drawings.
   6. Wet forms sufficiently to prevent joints in wood forms from opening prior to concrete pour.
   7. Do not use stay-in-place metal forms.

B. Earth Forms: Earth forms are not permitted.

3.4 CONSTRUCTION

A. Form Removal
   1. Remove forms in accordance with ACI 347 without damage to concrete and in a manner to ensure complete safety and serviceability of the structure.
      a. Do not cut form ties back from the face of the concrete.
      b. Concrete surface shall not contain residual form coating that will interfere with other materials or coatings to be applied.
      c. Concrete containing slag ground granulated blast furnace slag tends to develop strength slower than a concrete containing 100 percent Portland Cement.
   2. Do not remove supporting forms or shoring until the members have acquired sufficient strength to safely support their weight and the anticipated construction loads without distortion or excessive deflection. Consent to remove forms does not relieve the Contractor of the responsibility for the safety of the work.
   3. When the atmospheric temperature at the site has been continuously above 50 degrees F from the time of the pour, the forms shall be removed at the earliest practical time within the limits set forth in this paragraph, and wet curing shall continue without delay.
      a. Forms for walls and other vertical faces may be carefully removed 24 hours after the last portion of concrete in the section involved has been placed, provided the concrete has sufficiently hardened to preclude damage resulting from form
removal, and provided these members are not subjected to loads for a period of 14 days.

b. Maintain horizontal forms in place for a minimum of 14 days or until the concrete, as determined by job-cured cylinders, has attained a compressive strength of 3,000 p.s.i. unless noted otherwise.

c. When a water-reducing retarder is used in the concrete mix, the normal time periods for removing forms may need to be increased.

4. When the atmospheric temperature at the site drops below 50 degrees F, leave all forms in place for at least 5 days regardless of the temperature within the protective covering or enclosure. Upon removal of forms, notify the Construction Manager in order that a review of the newly stripped surfaces may be made before patching.

3.5 RE-USE OF FORMS

A. Forms for re-use shall meet new form requirements with respect to effect on poured concrete appearance and structural stability.

B. Do not delay or change the concrete pour schedule as a result of reusing forms compared to the schedule obtainable if all forms were new (in the case of wood forms) or if the total required forms were available (in the case of metal forms).

END OF SECTION 03 11 00
SECTION 03 20 00 - CONCRETE REINFORCING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. The work specified in this Section consists of furnishing and installing reinforcement for concrete structures.

1.2 RELATED SECTIONS

A. Section 03 30 53: Miscellaneous Cast-in-Place Concrete.

1.3 REFERENCES

A. American Concrete Institute (ACI):
   1. ACI 315; Details and Detailing of Concrete Reinforcement.
   2. ACI 318-02; Building Code Requirements for Structural Concrete.

B. American Society for Testing and Materials (ASTM):
   1. ASTM A 82; Specification for Steel Wire, Plain, for Concrete Reinforcement.
   2. ASTM A 185; Specification for Steel Welded Wire Reinforcement, Plain, for Concrete Reinforcement.
   3. ASTM A 615; Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
   4. ASTM A 36; Specification for Carbon Structural Steel.

C. Concrete Reinforcing Steel Institute: Manual of Standard Practice.

1.4 SUBMITTALS

A. Shop Drawings and Product Data:
   1. Prepare shop drawings of concrete reinforcement in accordance with American Concrete Institute's ACI 315.
   2. Provide drawings showing all fabrication dimensions and locations for placing reinforcement and bar supports; indicate bending diagrams, splicing and lap of rods, shapes, dimensions and details of bar reinforcing and accessories.
   3. Product Data: Submit manufacturer’s descriptive product data and current specification for each product specified herein, include installation instructions.

B. Test Reports:
   1. Submit copies of reports showing the results of tests, conducted in accordance with the American Society for Testing and Materials Specifications.
   2. Test Requirements may be waived based upon certified copies of mill test reports.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage of Materials:
   1. Store reinforcing materials in a manner to prevent excessive rusting and fouling with dirt, grease and other bond-breaking coatings.
   2. Identify bundles of reinforcing steel with tags wired to steel.
1.6 PROJECT CONDITIONS

A. Protection: Protect in-place reinforcement from excessive construction traffic and other work.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Reinforcing Steel:
1. Reinforcement Bars: ASTM A 615, Grade 60, deformed steel.
2. Wire: ASTM A 82.

B. Rebar Splicing Coupler: A two-piece splicing system manufactured from ASTM A 615 Grade 60 deformed rebar. A dowel bar splicer with integral nailing flange shall be threaded for a threaded dowel-in rebar such that the completed splice exceeds the tensile requirements of ACI 318.
1. Internal Coupler Protector: Provide coupler manufacturer’s plastic internal coupler protector where couplers are provided for anticipated future additions.
2. Bar End Protectors: Plastic solid sleeve for placement over bar ends to protect threading from damage, contamination, and rust.
3. Use Rebar Splicing Coupler only where shown on Drawings or where approved by the Engineer.
4. Acceptable Manufacturers:
   a. Dayton Superior Corp.
   b. Or equal.

C. Deformed Bar Anchors: ASTM A 108 cold worked, deformed wire per ASTM A 496 with minimum yield strength of 50 ksi and minimum ultimate tensile strength of 61 ksi. Bar anchor shall be low carbon steel with the following properties C -0.23 max, Mn – 0.90 max, P – 0.040 max and S – 0.050 max.
1. Anchors shall be similar to Nelson, flux-filled deformed bar anchor, Type D2L, by Nelson Stud Welding or equal.

2.2 FABRICATION

A. General: Fabricate reinforcement to the dimensions indicated on the Drawings and within the tolerances given in ACI 315. Perform bending of steel reinforcement by the cold bending method.
1. Do not use bars with kinks or bends not indicated on Drawings.
2. Perform bar shape fabrication in a manner that will not injure the material or lessen the member strength.
3. Use a designed bending machine, either hand- or power-operated.
4. Do not field bend bars partially embedded in concrete unless approved by the Engineer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Placing:
1. Place metal reinforcement accurately and securely brace against displacement within permitted tolerances and in accordance with ACI 318 through the use of reinforcing accessories.
2. Continue reinforcement across or through construction joints.
3. When obstructions interfere with the placement of reinforcement, pass such obstructions by placing reinforcing around it. Do not bend the reinforcing to clear the obstructions.
4. Install welded wire fabric as indicated, lapping joints eight inches and wiring securely. Extend welded wire fabric to within two inches of sides and ends of slabs.
5. Do not lay metal reinforcement on formwork.
6. Place slab reinforcement supported from the ground on concrete blocks of the correct height and having a compressive strength equal to or greater than the specified compressive strength of concrete being placed. Use concrete blocks not larger than 3 inches by 3 inches with a height equal to required bottom steel cover.
7. Place additional reinforcement around openings in slabs and walls as detailed on the Drawings.
8. Reinforcement supported from formwork for slabs, use bar chairs made of plastic or metal.
9. Deformed bar anchors shall be field welded to slab edge steel bent plate as shown on the drawings.

B. Splicing:
1. Splice metal reinforcement as indicated on the Drawings and in accordance with ACI 318.
2. Welding of crossing bars (tack welding) is not permitted.
3. Secure metal reinforcement at intersections with not less than No. 16-gauge annealed wire or appropriate size clips. When bar spacing is less than 12 inches, tie alternate intersections.
4. Make mechanical butt splice in accordance with rebar splicing coupler manufacturer’s installation instructions.

C. Slab Joint Dowel Bar Installation:
1. Install one-half the length of coated bar dowel into slab to be poured.

D. Cleaning:
1. Clean or otherwise protect metal reinforcement so that at the time concrete is placed, reinforcement is free from rust, scale or other coatings that will destroy or reduce bond.

E. Concrete Reinforcement Protection:
1. Provide protection for reinforcement during concrete pours in accordance with ACI 318, unless indicated otherwise on the Drawings.

3.2 INSPECTION

A. Notify Construction Manager 48 hours before placing concrete so he can inspect placement of metal reinforcement.

END OF SECTION 03 20 00
PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

B. Select Environmentally preferable materials that conserve natural resources, encourage sustainable stewardship of resources, minimize the generation of waste and pollution during construction, and contribute to a healthy permanent building environment.

C. The essence of this Project is to complete the Work using sustainable design and construction standards, as defined by the Owner. These standards include, but are not limited to: incorporating low-environmental-impact items into the Work; using recycled content; obtaining products from suppliers within 500 miles of Project site; employing construction practices that minimize negative environmental effects on the site and surrounding area. Any and all proposals by any and all Contractors will be evaluated according to these standards. The Owner reserves the right to reject any product or method that, in Owner’s sole opinion, is in conflict with these standards.

D. Contractors are responsible for submitting LEED certifications as indicated in subsequent sections of the specification.

1.02 ENVIRONMENTAL ISSUES (This section is for information only. For requirements related to meeting environmental goals, see instructions in the body of this specification following this section).

A. Problems:
   1. Production of Portland cement is energy intensive and emissions contribute significant amounts of carbon dioxide and particulates to the atmosphere.
   2. Mining of coarse and fine aggregate can cause local pollution and damage to natural habitats.
   3. Discarded formwork generates waste.
   4. Some curing compounds, release agents and sealers emit VOC’s especially during the curing process, compromising indoor air quality and contributing to ground level ozone, also known as “smog”.
   5. Residual water generated by wash-out of transit mix truck drums can cause localized pollution.

B. Solutions:
   1. Use byproducts from other processes (fly ash, slag, silica fume, rice hull ash) as supplementary cementitious materials added to the concrete as a "blended cement" or as a separately batched ingredient proportioned for the performance requirements of the Project. Use of byproducts diverts this material from landfills while reducing Portland cement requirements.
2. Use gray water in production of ready mixed concrete. See ASTM C94 for guidelines and requirements.

3. Demolition concrete is a great source of aggregate. Using recycled aggregate in place of virgin aggregate reduces mining and diverts waste material from landfills. Uses range from sub-base material to coarse aggregate in structural concrete.

4. Recycle, reuse or use alternative formwork systems

5. Specify low VOC or water or vegetable – based curing compounds, form release agents and sealers.

1.03 WORK INCLUDED

A. Work of this section includes all labor, materials, equipment and services necessary to complete the concrete work as shown on the drawings and specified herein, including, but not limited to the following:

1. Foundation systems including walls, footings, piers, pits, etc.
2. Slabs on grade.
3. Structural slabs on metal deck.
4. Stair pan fills.
5. Furnishing and installing all required anchors and inserts.
6. Placing in the forms all inserts, anchors, anchor bolts, bearing plates, etc. furnished by other trades for casting into the concrete and cleaning of same after stripping of forms.
7. Protection of all inserts, anchors, hangers, sleeves and supports furnished and set by others for the attachment of other work to the concrete, or required to permit the passage of other work through the concrete.
8. Supply, fabricate and place all required reinforcing bars, mesh and other reinforcement for concrete where shown, called for, and/or required complete with proper supporting devices.
9. Erection and removal of all formwork required to properly complete the work.
10. Finishing of all concrete work as hereinafter specified.
11. Curing and protection of all concrete work.
12. Site walls and structures, excluding curbs, walks and paving as shown on the drawings.
13. Floor sealers and dustproofing of all areas exposed and/or covered with carpet.
14. Patching, grouting, and pointing up as required.
15. Vapor barrier system below slabs on grade.
17. Grouting of all beam bearing plates and column base plates.
18. Embedded plates in all foundation walls.
19. Equipment pads as required.
20. All other work and materials as may be reasonably inferred and needed to make the work of this section complete.

1.04 RELATED WORK
A. Masonry work.
B. Structural steel.
C. Metal deck.
D. Miscellaneous metal work.
E. Earthwork.
F. Carpentry.
G. Dewatering.
H. Waterproofing.
I. Site curbs, walks and paving

1.05 SUBMITTALS

A. Product Data: Submit data for proprietary materials and items, including reinforcement and forming accessories, admixtures, patching compounds, waterstops, joint systems, curing compounds, dry-shake finish materials, and others as requested by Architect.

B. Shop Drawings; Reinforcement: Submit original shop drawings for fabrication, bending, and placement of concrete reinforcement. Comply with ACI 315 "ACI Detailing Manual" showing bar schedules, stirrup spacing, diagrams of bent bars, arrangement of concrete reinforcement. Include special reinforcement required for openings through concrete structures. The shop drawings shall be prepared only by competent detailers, checked by the contractor prior to submission.
   1. The shop drawings shall show all construction joint locations and the added reinforcement required at same.
   2. Obtain and coordinate information for sleeves and openings in concrete, which are required for the work of other trades. Make coordinated drawings showing size and location of openings, sleeves, and additional reinforcing, and incorporate this information on the reinforcing drawings.
   3. Only those splices indicated on the approved shop drawings will be permitted.
   4. Provide elevations of all foundation walls and other structural elements to a minimum 1/4" scale.

C. Slab Edge, Penetration and Embedment Drawings: Submit a fully coordinated plans at each level that dimension to scale all embedded items, all items that penetrate the slab and slab edges. Information shown shall include, but not be limited to, conduits, piping, inserts, anchors, bearing plates, slab depressions or block-outs, etc.

D. Samples: Submit samples of materials as requested by Architect, including names, sources and descriptions.

E. Laboratory Test Reports: Submit laboratory test reports for concrete materials, mix design test and microwave test.
F. Material Certificates: Provide materials certificates in lieu of materials laboratory test reports when permitted by Architect. Manufacturer and Contractor shall sign material certificates, certifying that each material item complies with, or exceeds, specified requirements. Provide certification from admixture manufacturers that chloride content complies with specification requirements.

G. Recycled Aggregate: Provide laboratory reports indicating that aggregate conforms to relevant ASTM standards and recommendations. Provide cut sheets clearly indicating the source, total weight and volume of the recycled aggregate. If aggregate provided is a mix of virgin and recycled aggregates obtain a written affidavit from the manufacturer stating the recycled content percentage.

H. Formwork Shop Drawings: Submit shop drawings signed and sealed by a professional engineer licensed in the Commonwealth of Virginia for fabrication and erection of specific finished concrete surfaces. Show form construction including jointing, special form joint or reveals, location and pattern of form tie placement, and other items which affect exposed concrete visually.

1. Architect's review is for general architectural applications and features only. Design of formwork for structural stability and efficiency is Contractor's responsibility.

I. LEED Submittals:
1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of post-consumer and pre-consumer recycled content.
   a. Include statement indicating costs for each product having recycled content.
2. Credit MR 5.1: List of proposed regionally manufactured materials and regionally extracted, harvested, or recovered materials.
   a. Identify each regionally manufactured material, its source, and cost.
   b. Identify each regionally extracted, harvested, or recovered material, its source, and cost.
   c. Include statement confirming the following, and identifying the nearest town for each indicated location.
      1) Distance between location of manufacture and Project site.
      2) Distance between location of extraction, harvesting, or recovery, and Project site.

1.06 QUALITY ASSURANCE

A. Codes and Standards: Comply with provisions of following codes, specifications, and standards, except where more stringent requirements are shown or specified:
1. Governing Building Codes having jurisdiction over the project.
2. ACI 117-90 "Standard Specifications for Tolerances for Concrete Construction and Materials".
3. ACI Manual of Concrete Practice (Latest Edition)
4. CRSI-WCRSI, "Placing Reinforcing Bars".
5. AWS D1.4, "Structural Welding Code - Reinforcing Steel".
6. The ACI Field Reference Manual, SP-15 shall be kept at the job site, and the practices set forth therein shall be strictly adhered to.
8. Concrete Reinforcing Steel Institute (CRSI) "Manual of Standard Practice".
9. ASTM C 618 “Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete”
10. ASTM C 989 “Ground Granulated Blast-Furnace Slag for Use in Concrete and Mortars”

B. Should materials and installed work require testing and retesting at anytime during progress of work, tests, including retesting of rejected materials for installed work, shall be performed at Contractor's expense.

1.07 PROJECT CONDITIONS:

A. The contractor, before commencing work, shall examine all adjoining work on which this work is in any way dependent for proper installation and workmanship according to the intent of this specification, and shall report to the Architect/Engineer, any condition, which prevents this contractor from properly performing their work.

B. Protection of Footings Against Freezing: Cover completed work at footing level with sufficient temporary or permanent cover as required to protect footings and adjacent subgrade against possibility of freezing; maintain cover for time period as necessary.

C. Protect adjacent finish materials against spatter during concrete placement.

D. Provide all barricades and safeguards at all pits, holes, shaft and stairway openings, etc., to prevent injury to workmen and others within and about the premises. Also provide all safeguards as required by the Building Code, OSHA, or any other departments having jurisdiction. Take full responsibility for all safety precautions and methods.

PART 2 - PRODUCTS

2.01 FORM MATERIALS
A. Forms for Exposed Finish Concrete: Unless otherwise indicated, construct of plywood, metal, metal-framed plywood faced, or other acceptable panel-type materials, to provide continuous, straight, smooth, exposed surfaces. Furnish in largest practicable sizes to minimize number of joints and to conform to joint system shown on drawings. Provide form material with sufficient strength and thickness to withstand pressure of newly placed concrete without bow or deflection.

1. Use plywood complying with U.S. Product Standard PS-1 "B-B (Concrete Form) Plywood", Class I, Exterior Grade or better, mill oiled and edge-sealed, with each piece bearing legible inspection trademark.

B. Forms for Unexposed Finish Concrete: Plywood, lumber, metal, or other acceptable material. Provide lumber dressed on at least 2 edges and one side for tight fit.

C. Form Coatings: Provide VOC compliant commercial formulation form-coating compounds that will not bond with, stain nor adversely affect concrete surfaces, and will not impair subsequent treatments of concrete surfaces. Use bio. Use biodegradable form release agent listed below or equivalent made from soy or rapeseed oil.

1. Soy Form Away by Cure & Seal by Natural Soy Products,
4. For additional products see GreenSpec Product Directory, BuildingGreen Inc at www.buildinggreen.com

D. Form Ties: Form ties and spreaders: prefabricated assemblies by Richmond; Superior, Dayton or approved equal. Wire ties shall not be used for formwork support. Ties for foundation work shall be of snap design with removal cones and water seal washer.

E. Load Bearing Foam Formwork: Dow High Load 60 Styrofoam or equal.

2.02 REINFORCING MATERIALS

A. Deformed Reinforcing Bars: ASTM A615, Grade 60. Minimum recycled content 85%.

B. Steel Wire: ASTM A82, plain, cold-drawn steel.

E. Supports for Reinforcement: Bolsters, chairs, spacers and other devices for spacing, supporting and fastening reinforcing bars and welded wire fabric in place. Use wire bar type supports complying with CRSI specifications.
   1. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms, provide supports with legs which are plastic protected (CRSI, Class I) or stainless steel protected (CRSI, Class 2), at a spacing not to exceed 4'-0" on center in either direction.

F. Mechanical Couplers: Mechanical couplers for reinforcing shall develop 125 percent of the specified yield strength of the reinforcing bars being spliced.

G. Use recycled plastic rebar supports (give preference to local supplier if available)
   1. New Century Northwest – Eugene, OR 541-342-5400
   2. Eclipse Plastic – Snohomish, WA tel: 1-800-278-4276

2.03 CONCRETE MATERIALS

A. Portland Cement: ASTM C 150, Type I or I/II: Use one brand of cement throughout project, unless otherwise acceptable to Architect.

B. Pozzolans and Slags: Must be completely accounted for in the design mix. Replace Portland cement by weight with not less than 25% for Fly Ash OR not less than 40% for Ground Granulated Blast Furnace Slag. Mix design must meet minimum design requirements set in the contract documents, additional admixtures may be required to meet early strength requirements AND alternative cementitious material goals. Note: If a "blended cement" is used which already contains a certain percentage of Pozzolans or Slags this content may offset or entirely satisfy the minimum percentage required.
   1. Coal Fly Ash: ASTM C618, Type C or Type F.
   3. Blended hydraulic cement, as defined by ASTM C595 or ASTM C 1157.
   4. Alternative pozzolans: Silica Fume (ASTM C 1240) and Rice Hull (or “husk”) Ash. ASTM C618, are acceptable with the approval of the Engineer.

C. Normal Weight Aggregates: ASTM C 33, and as herein specified. Provide aggregates from a single source for exposed concrete.
   1. Normal weight Fine Aggregate: washed, inert, natural or manufactured or combination thereof, sand conforming ASTM C33 gradation.
   2. Normal weight Coarse Aggregate: well graded crushed stone or washed gravel conforming to ASTM C33, sizes #57 for foundations, slabs and structure.

D. Lightweight Aggregates: ASTM C 330. Well-graded crushed expanded shale produced by rotary kiln method. 3/4" maximum aggregate size. Lightweight aggregate shall be saturated surface dry prior to addition of mix water. W/C ratio shall account for aggregate moisture content.
E. Water: Free from oils, acids, alkali, organic matter and other deleterious material to conform to ASTM C94.

F. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.

Products: Subject to compliance with requirements, provide one of the following:

"Air-Mix": Euclid Chemical Co.
"MB-VR": Master Builders.
"Sika Aer": Sika Corp.
"Darex AEA": W.R. Grace.

G. Water-Reducing Admixture: ASTM C 494, Type A, and containing not more than 0.05 percent chloride ions.

Products: Subject to compliance with requirements, provide one of the following:

"Eucon WR-75 or WR-89": Euclid Chemical Co.
"Pozzolith Normal": Master Builders.
"Plastocrete 160": Sika Chemical Corp.
"WRDA Hycol": W.R. Grace.

H. High-Range Water-Reducing Admixture (Superplasticizer): ASTM C 494, Type F or Type G and containing not more than 0.05 percent chloride ions.

Products: Subject to compliance with requirements, provide one of the following:

"Eucon 37": Euclid Chemical Co.
"Rheobuild 1000": Master Builders.
"Sikament 300": Sika Chemical Corp.
"Daracem-100": W. R. Grace.

I. Water Reducing, Non-Corrosive Accelerating Admixture: The admixture shall conform to ASTM C 494, Type C or E, and not contain more chloride ions than are present in municipal drinking water. The admixture manufacturer must have long-term non-corrosive test data from an independent testing laboratory (of at least a year's duration) using an acceptable accelerated corrosion test method such as that using electrical potential measures.

Products: Subject to compliance with requirements, provide the following:

"Accelguard 80": Euclid Chemical Co.
"Daraset": W. R. Grace
"Pozzutech 20": Master Builders
J. Water-Reducing, Retarding Admixture: ASTM C 494, Type D, and contain not more than 0.05 percent chloride ions.

Products: Subject to compliance with requirements, provide one of the following:

"Eucon Retarder 75": Euclid Chemical Co.
"Pozzolith Retarder": Master Builders.
"Plastiment": Sika Chemical Co.
"Daratard": W.R. Grace.

L. Prohibited Admixtures: Calcium chloride, thyocyanates or admixtures containing more than 0.05 percent chloride ions are not permitted.

M. Certification: Written conformance to the above-mentioned requirements and the chloride ion content of admixtures will be required from the admixture manufacturer prior to mix design review by the Engineer.

N. Contractor will be required to provide information demonstrating successful use in prior placement involving all admixtures.

O. Penetrating Sealers: At concrete slabs or topping slabs directly exposed to weather (except at locations where floors are coated with a finish or a traffic bearing membrane is to be installed) and as indicated, provide silane or siloxane penetrating sealer.

Products: Subject to compliance with requirements, provide the following or approved equal:

"Enviroseal 40": Hydrozo Water Repellent Systems
"Price Aqua Silane-40": Price Research, LTD.

Q. Fly Ash: ASTM C 618, Type C or Type F.

R. Ground Granulated Blast-Furnace Slag: ASTM C989, Grade 100 or 120.

2.04 RELATED MATERIALS

A. Waterstops: Grace Adcore ES self-expanding strip waterstops.

B. Granular Base: (Underslab drainage course): ¾” to 1” crushed stone, gravel, or recycled concrete aggregate as approved by Engineer to provide, when compacted, a smooth and even surface below slabs on grade and where indicated. The material shall be:

1. Be provided only from PennDOT approved sources.
2. Be quarried from the following formations in the Central Pennsylvania region:
   Limestone
   Nealmont Formation (Rodman and Centre Hall members)
Linden Hall Formation (Valentine, Valley View, and Stover members)
Snyder Formation
Hatter Formation
Dolostone
Belleville Formation (Tea Creek and Coffee Run members)
Nittany Formation
Mixed Limestone and Dolostone
Axemann Formation

3. The selected aggregate material shall meet PENNDOT specifications and these additional restrictions:
   a) Contain less than 0.5% pyrite (i.e. 0.3% S)
   b) Contain less than 1% deleterious materials
   c) Limit the sulfur content to 0.1% if it is in the form of frambooidal pyrite in a carbonaceous shale or as whisker pyrite veins
   d) Contain less than 15% thin, elongate, or platy pieces.

4. Provide advance examination and testing according to methods referenced, or as required by the Professional, for aggregate materials.
   a) Conduct aggregate quality tests in accordance with requirements of PENNDOT Section 703.
   b) Conduct petrographic examination of aggregate samples representative of proposed material according to procedure defined in ASTM C 295. Examination shall be performed by an experienced petrographer.
   c) Conduct chemical analysis of aggregate samples representative of proposed materials according to procedure defined in ASTM C 1580.
   d) Professional reserves the right to accept aggregate materials based on certification from supplier that aggregate originates from a source approved by PENNDOT and that the aggregate complies with specified PENNDOT requirements and the additional requirements included herein.

5. Contractor providing stone or aggregate shall submit Independent Testing Agency test results indicating compliance with the above conditions prior to the start of work every three months thereafter. In addition, Independent Testing Agency shall perform testing of aggregate samples any time the source of stone or aggregate is changed. [C]

C. Non-Shrink, Non-Metallic Grout: The non-shrink grout shall be a factory pre-mixed grout and shall conform to ASTM C1107, "Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Non-Shrink)."

Products: Subject to compliance with requirements, provide one of the following:

"Euco-NS": Euclid Chemical Co.
"Five Star Grout": U.S. Grout Corp.
"Masterflow 713": Master Builders.

D. High Flow Grout: Where high fluidity and/or increased placing time is required, use high flow grout. The factory pre-mixed grout shall conform to ASTM C1107,
"Standard Specification for Packages Dry, Hydraulic-Cement Grout (Non-shrink)." In addition, the grout manufacturer shall furnish test data from an independent laboratory indicating that the grout when placed at a fluid consistency shall achieve 95% bearing under a 18" x 36" base plate.

Products: Subject to compliance with requirements, provide one of the following:

"Euco Hi-Flow Grout": Euclid Chemical Co.
"Masterflow 928": Master Builders

E. Non-slip Aggregate Finish: Provide fused aluminum oxide grits, or crushed emery, as abrasive aggregate for non-slip finish with emery aggregate containing not less than 40% aluminum oxide and not less than 25% ferric oxide. Use material that is factory-graded, packaged, rustproof and non-glazing, and is unaffected by freezing, moisture, and cleaning materials.

F. Absorptive Cover: Burlap cloth made from jute or kenaf, weighing approximately 9 oz. per sq. yd., complying with AASHTO M 182, Class 2.

G. Moisture-Retaining Cover: One of the following, complying with ASTM C 171.
   1. Waterproof paper.
   2. Polyethylene film.
   3. Polyethylene-coated burlap.

H. Curing Compounds: Clear Curing and Sealing Compound (VOC Compliant): The compound shall have 30% solids content minimum, and will not yellow under ultra violet light after 500 hours of test in accordance with ASTM D4887 and will have a maximum moisture loss of 0.039 grams per sq. cm. when applied at a coverage rate of 250 sq. ft. per gallon.

Products: Subject to compliance with requirements, provide one of the following:

"Super Aqua Cure": Euclid Chemical Co.
"Super Diamond Clear VOX": Euclid Chemical Co.
"MasterKure 200W": Master Builders

I. Curing/Hardening Compound: The product shall be a sodium silicate based compound which reacts with concrete constituents to harden the surface. The film is gone in seven (7) days.

Products: Subject to compliance with requirements, provide one of the following:

"Eucosil": Euclid Chemical Company
"Sonosil": Sonneborn

J. Crack Sealer: Elastomeric liquid crack sealer resistant to water, gasoline, oil and salts.
Products: Subject to compliance with requirements, provide one of the following:

"Plasti-seal": Euclid Chemical Co.
"Sikadur 35, Hi Mod LV LPL": Sika

K. Underlayment Compound: Free flowing, self-leveling, pumpable cementitious base compound.

Products: Subject to compliance with requirements, provide the following:
"Flo-Top": Euclid Chemical Co.
"Ardex": Ardex Co.
"Underlayment 110": Master Builders

L. Bonding Admixture: The compound shall be a latex, non-rewettable type.

Products: Subject to compliance with requirements, provide one of the following:
"Flex-Con": Euclid Chemical Co.
"Daraweld C": W.R. Grace
"SBR Latex": Euclid Chemical Co.

M. High Strength Polymer Repair Mortar: For form and pouring or large horizontal repairs, provide the flowable on-part, high strength repair mortar.

Products: subject to compliance with requirements, provide the following:
"Eucocrete": The Euclid Chemical Company
"Euco Speed MP" (Cold Weather): The Euclid Chemical Company

N. Evaporation Retardant – Products: Subject to compliance with requirements, provide one of the following:
"Eucobar": Euclid Chemical Co.
"Confilm": Master Builders

O. Vapor Barrier: Provide vapor barrier cover over prepared base material where indicated below slabs on grade. Use only materials, which are resistant to decay when tested in accordance with ASTM E 1745, Class A.

Products: Subject to compliance with requirements, provide one of the following:
“Premoulded Membrane Vapor Seal with Plasmatic Core” W.R. Meadows Seal Tight

P. Liquid Densifier: The liquid densifier compound shall be a siliconate-based sealer, which penetrates concrete surfaces, increases abrasion resistance and provides a "low-sheen" surface.

Products: Subject to compliance with requirements, provide one of the following:
"Euco Diamond Hard": Euclid Chemical Co.
2.05 PROPORTIONING AND DESIGN OF MIXES

A. Preparation of Design Mixes: All mix designs shall be proportioned in accordance with ACI 318, ACI 301, and prepared by the Ready-Mix supplier who will be supplying concrete to the project. Submit separate mix designs on each class of concrete for review.
   1. If previously used mixes are submitted, all materials shall be from the same sources and with the same brand names as the previously utilized mix.
   2. If trial batches are used, the mix design shall be prepared by an independent testing laboratory and shall achieve an average compressive strength 1200 psi higher than the specified strength.
   3. The proposed mix designs shall be accompanied by complete standard deviation analysis or trial mixture test data.

B. Submit each proposed mix on the mix design submittal form (included at the end of this specification) to the Architect and Structural Engineer for review at least 5 days prior to the pre-concrete conference. Do not begin concrete production until Architect has reviewed and approved mixes.

C. Design mixes to provide normal weight concrete with the properties shown on the drawings and following additional properties:
   1. Cementitious Material replacement for concrete mixes at all concrete shall be 25% minimum and 50% maximum using one of the following: Ground Granulated Blast Furnace Slag (GGBFS) or Fly Ash.
   2. Provide Crystalline waterproofing admixture to walls specified as crystalline waterproofed. Add to mix per manufacturer's recommendation. Maintain specified concrete strengths.
   3. Maximum cementitious materials content shall not exceed 600 lb./cy.

E. Lightweight Concrete: Proportion mix as herein specified. Provide mix to produce strength as noted on drawings, with a split-cylinder strength factor (Fct) of not less than 5.5 and a dry weight of not less than 105 pcf or more than 115 pcf after 28 days. Limit shrinkage to 0.03 percent at 28 days.

F. Adjustment to Concrete Mixes: Mix design adjustments may be requested in writing by Contractor when characteristics of materials, job conditions, weather, test results, or other circumstances warrant; at no additional cost to Owner and as accepted by Architect. Laboratory test data for revised mix design and strength results must be submitted to and accepted by Architect before using in work.

G. Admixtures:
1. Use water-reducing admixture or high range water-reducing admixture (super plasticizer) in all concrete as required for placement and workability.

2. Use non-corrosive, non-chloride accelerating admixture in concrete slabs placed at ambient temperatures below 50°F (10°C).

3. Use high-range water-reducing admixture in pumped concrete, concrete required to be watertight, and concrete with water/cement ratios below 0.50.

4. Use air-entraining admixture in exterior concrete exposed to freeze/thaw conditions, unless otherwise indicated. Add air-entraining admixture at manufacturer’s prescribed rate to result in concrete at point of placement having total air content of 6 percent with a tolerance of plus-or-minus 1-1/2 percent. Otherwise, provide air-entrainment as follows:
   a. Other Concrete: (not exposed to freezing, thawing, or hydraulic pressure): 2 percent to 4 percent air.
   b. Concrete subjected to vehicular traffic: 3 percent maximum.

5. Use admixtures for water-reducing and set-control in strict compliance with manufacturer’s directions.

H. Water-Cementitious Materials Ratio: Provide concrete for following conditions with maximum water-cementitious materials (W/C) ratios of 0.45, or as indicated in the drawings and in related specifications, except as follows:
   1. Loading dock; W/C 0.40.

I. Slump Limits: Proportion and design mixes to result in concrete slump as follows:
   1. 2” to 4” slump prior to addition of water-reducing admixtures. 8” maximum slump after addition of water-reducing admixtures.

J. Chloride Ion Level: Chloride ion content of aggregate shall be tested by the laboratory making the trial mixes. The total chloride ion content of the mix including all constituents shall not exceed the limitations set forth in Table 4.4.1 of ACI 318 for concrete subjected to deicers or exposed to chloride in service (0.15 chloride ions by weight of cement).

K. Aggregate Gradation: Well graded from coarsest to finest in accordance with ASTM C33 for normal weight course and fine aggregate and ASTM C330 for lightweight course aggregate.

2.06 CONCRETE MIXING

A. Ready-Mix Concrete: Comply with requirements of ASTM C 94, and as herein specified.
B. Provide batch ticket for each batch discharged and used in work, indicating project identification name and number, date, mix type, mix time, quantity, and amount of water introduced at the plant and on site.

C. During hot weather, or under conditions contributing to rapid setting of concrete, a shorter mixing time than specified in ASTM C 94 may be required. When air temperature is between 85°F (30°C) and 90°F (32°C), reduce maximum mixing and delivery time from 1-1/2 hours to 75 minutes, and when air temperature is above 90°F (32°C), reduce maximum mixing and delivery time to 60 minutes unless concrete is cooled and temperature is maintained at an acceptable level.

D. A maximum of 10% of the total volume of water of a batch may be withheld from the mix at the plant and added on site. This water limit shall not be exceeded and shall not be used to re-temper the concrete. No water shall be added after placing of concrete from a batch has begun.

E. No water shall be added after mixing to concrete containing HRWR (Superplasticizer). If loss of slump occurs, the concrete treated with HRWR may be retempered as long as a "flash set" has not occurred. Retempering procedures must be discussed and approved by the Engineer and the manufacturer at the Pre-Concrete Conference. Water shall not be added to concrete at the site.

2.07 PRE-CONCRETE CONFERENCE:

A. At least 14 days prior to the start of the concrete construction schedule, the contractor shall conduct a meeting to review the proposed mix designs and to discuss the required methods and procedures to achieve the required concrete construction. The contractor shall send a pre-concrete conference agenda to all attendees 7 days prior to the scheduled date of the conference.

B. The contractor shall require responsible representatives of every party who is concerned with the concrete work to attend the conference, including but not limited to the following: Contractor's superintendent, Quality Control Testing and Inspection Agency, Concrete subcontractor, Ready-mix concrete producer.

C. Minutes of the meeting shall be recorded, typed and printed by the contractor and distributed by him to all parties concerned within 5 days of the meeting. One copy of the minutes shall also be transmitted to the following for information purposes: Owner's representative, Quality Control Testing and Inspection Agency, Structural engineer.

D. The minutes shall include a statement by the admixture manufacturer(s) indicating that the proposed mix design and placing can produce the concrete quality required by these specifications.
E. The Structural Engineer will be present at the conference. The Contractor shall notify the Structural Engineer at least 7 days prior to the scheduled date of the conference.

PART 3 - EXECUTION

3.01 GENERAL

A. Coordinate the installation of joint materials, embedded items and vapor retarders with placement of forms and reinforcing steel.

3.02 INSPECTION

A. Examine all work prepared by others to receive work of this section and report any defects affecting installation to the contractor for correction. The contractor’s commencement of work will be interpreted as their complete acceptance of preparatory work by others.

3.03 CONCRETE STRENGTH

A. Concrete shall develop the minimum compressive strengths shown on drawings at 28 days when sampled and tested in accordance with ASTM C31 and C39.

B. Fly Ash Concrete & Slag Concrete: Concrete mixes containing high volumes of fly ash or Slag have slower set times and may take up to 56 days to reach full strength. The structural engineer, agency responsible for concrete mix design, the architect and the concrete subcontractor must coordinate to ensure that the form stripping schedule is consistent with the ability of the structure to support itself and all imposed construction loads.

3.04 FORMS

A. Design, erect, support, brace and maintain formwork to support vertical and lateral, static, and dynamic loads that might be applied until such loads can be supported by concrete structure. Construct formwork so concrete members and structures are of correct size, shapes, alignment, elevation and position. Maintain formwork construction tolerances complying with ACI 117. Provide Class A tolerances for concrete exposed to view. Provide Class C tolerances for other concrete surfaces.

B. Design formwork to be readily removable without impact, shocks or damage to cast-in-place concrete surfaces and adjacent materials.

C. Construct forms to size shapes, lines and dimensions shown, and to obtain accurate alignment, location, grades, level and plumb work in finished structures. Provide for openings, offsets, keyways, recesses, moldings, rustications, reglets,
chamfers, blocking, screeds, bulkheads, anchorages and inserts, and other features required in work. Use selected materials to obtain required finishes. Solidly butt joints and provide back-up at joints to prevent leakage of cement paste.

D. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces where slope is too steep to place concrete with bottom forms only. Kerf wood inserts for forming keyways, recesses, and the like, to prevent swelling and for easy removal.

E. Provide temporary openings where interior area of formwork is inaccessible for cleanout, for inspection before concrete placement, and for placement of concrete. Securely brace temporary openings and set tightly to forms to prevent loss of concrete mortar. Locate temporary openings on forms at inconspicuous locations.

F. Chamfer exposed corners and edges as indicated, using wood, metal, PVC or rubber chamfer strips fabricated to produce uniform smooth lines and tight edge joints.

G. Provisions for Other Trades: Provide openings in concrete formwork to accommodate work of other trades. Determine size and location of openings, recesses and chases from trades providing such items. Accurately place and securely support items built into forms.

H. Cleaning and Tightening: Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt or other debris just before concrete is placed. Retightening forms and bracing after concrete placement is required to eliminate mortar leaks and maintain proper alignment.

3.05 VAPOR BARRIER INSTALLATION

A. At slabs not detailed with mud slabs and below slab waterproofing: Following leveling and compaction of granular base for slabs on grade, place vapor retarder sheeting with longest dimension parallel with direction of pour. Adjust retarder placement details to conform with installation and performance requirements for finishes.

B. Lap joints 6" and seal with appropriate tape in accordance with manufacturer’s requirements.

C. Avoid cutting or puncturing vapor retarder during reinforcement placement and concreting operations.

3.06 PLACING REINFORCEMENT
A. Comply with Concrete Reinforcing Steel Institute’s recommended practice for placing reinforcing bars, for details and methods of reinforcement placement and supports, and as herein specified.

B. Clean reinforcement of loose rust and mill scale, earth, ice, and other materials, which reduce or destroy bond with concrete.

C. Accurately position, support and secure reinforcement against displacement by formwork, construction, or concrete placement operations. Locate and support reinforcing using metal chairs, runners, bolsters, spacers, and hangers, as required.

D. Place reinforcement to obtain coverage's for concrete protection. Arrange, space and securely tie bars and bar supports to hold reinforcement in position during concrete placement operations. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces.

E. Install welded wire fabric in as long lengths as practicable. Lap adjoining pieces at least one full mesh increment and lace splices with tie wire. Offset end laps in adjacent widths to prevent continuous laps in either direction.

3.07 JOINTS

A. Construction Joints: Locate and install construction joints as indicated, or if not indicated, locate so as not to impair strength and appearance of the structure, as acceptable to Architect.
   1. Provide keyways at least 1-1/2" deep in construction joints in walls, slabs and between walls and footings; accepted bulkheads designed for this purpose may be used for slabs. Keyways, where waterproofing is to be adhered to joint, shall be troweled smooth.
   2. Place construction joints perpendicular to main reinforcement. Continue reinforcement across construction joints, except as otherwise indicated.
   3. Construction joints in steel deck slabs shall be located within the middle third of a deck span when parallel to beams and at least 8 times the slab thickness from a girder or ½ the distance between girders for joints parallel to girders.

D. Waterstops: Provide waterstops in construction joints as indicated. Install waterstops to form continuous diaphragm in each joint. Make provisions to support and protect exposed waterstops during progress of work. Fabricate field joints in waterstops in accordance with manufacturer’s printed instructions, using manufacturer's specified welding irons.

E. Isolation Joints in Slabs-on-Ground: Construct isolation joints in slabs-on-ground at points of contact between slabs-on-ground and vertical surfaces, such as column pedestals, foundation walls, grade beams and elsewhere as indicated.
   1. Joint filler and sealant materials are specified in Division-7 sections of these specifications.
F. Contraction (Control) Joints in Slabs-on-Ground: A dry cut early entry saw, including Soff-Cut or approved equal shall be used to a minimum depth of 1-1/2", or 1/4 slab thickness, immediately after final finishing when concrete is firm enough to support equipment. Saw shall not damage surface or dislodge aggregate.

1. Joint sealant material is specified in Division-7 sections of these specifications.

3.08 INSTALLATION OF EMBEDDED ITEMS

A. General: Set and build into work anchorage devices and other embedded items required for other work that is attached to, or supported by, cast-in-place concrete. Use setting drawings, diagrams, instructions and directions provided by suppliers of items to be attached thereto.

B. Edge Forms and Screed Strips for Slabs: Set edge forms or bulkheads and intermediate screed strips for slabs to obtain required elevations and contours in finished slab surface. Provide and secure units sufficiently strong to support types of screed strips by use of strike-off templates or accepted compacting type screeds.

C. Embedded Plates at Foundation Walls: Install plate at top of forms so that exterior face of steel plate is level and plumb. Use construction documents for locations, sizes and elevations.

3.09 PREPARATION OF FORM SURFACES

A. Clean re-used forms of concrete matrix residue, repair and patch as required to return forms to acceptable surface condition.

B. Coat contact surfaces of forms with a form-coating compound before reinforcement is placed.

C. Thin form-coating compounds only with thinning agent of type, and amount, and under conditions of form-coating compound manufacturer’s directions. Do not allow excess form-coating material to accumulate in forms or to come into contact with in-place concrete surfaces against which fresh concrete will be placed. Apply in compliance with manufacturer’s instructions.

D. Coat steel forms with a non-staining, rust-preventative form oil or otherwise protect against rusting. Rust-stained steel formwork is not acceptable.

3.10 CONCRETE PLACEMENT

A. Ready-mix concrete shall comply with the requirements of ASTM C94 and ACI 304. All plant and transporting equipment shall comply with the concrete plant
standards and truck mixer and agitator standards of the National Ready Mix Concrete Association.

B. Cold and hot weather mixing procedures shall be submitted to the architect for approval.

C. Notify architect and testing organization at least 36 hours (1 1/2 regular working days) before each pour so that forms and reinforcing may be examined. Do not place concrete until inspection has been made by the owner provided independent testing agency.

D. Preplacement Inspection: Before placing concrete, inspect and complete formwork installation, reinforcing steel, and items to be embedded or cast-in. Notify other trades to permit installation of their work; cooperate with other trades in setting such work. Moisten wood forms immediately before placing concrete where form coatings are not used.
   1. Apply temporary protective covering to lower 2' of finished walls adjacent to poured floor slabs and similar conditions, and guard against spattering during placement.

E. General: Comply with ACI 304 "Recommended Practice for Measuring, Mixing, Transporting, and Placing Concrete", and as herein specified.

F. Deposit concrete continuously or in layers of such thickness that no concrete will be placed on concrete which has hardened sufficiently to cause the formation of seams or planes of weakness. If a section cannot be placed continuously, provide construction joints as herein specified. Deposit concrete as nearly as practicable to its final location to avoid segregation.

G. Placing Concrete in Forms: Deposit concrete in forms in horizontal layers not deeper than 18" and in a manner to avoid inclined construction joints. Where placement consists of several layers, place each layer while preceding layer is still plastic to avoid cold joints. Use internal vibrators penetrating both the top and preceding layers.

H. Consolidate placed concrete by mechanical vibrating equipment supplemented by hand-spading, rodding or tamping. Use equipment and procedures for consolidation of concrete in accordance with ACI recommended practices.

I. Use and type of vibrators shall conform to ACI 309 "Recommended Practice for Consolidation of Concrete". Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations not farther than visible effectiveness of machine. Place vibrators to rapidly penetrate placed layer and at least 6" into preceding layer. Do not insert vibrators into lower layers of concrete that have begun to set. At each insertion limit duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcement and other embedded items without causing segregation of mix.
J. Placing Concrete Slabs: Deposit and consolidate concrete slabs in a continuous operation, within limits of construction joints, until the placing of a panel or section is completed.

K. Consolidate concrete during placing operations so that concrete is thoroughly worked around reinforcement and other embedded items and into corners.

L. Bring slab surfaces to correct level with straightedge and strikeoff. Use highway straightedge, bull floats or darbies to smooth surface free of humps or hollows. Do not disturb slab surfaces prior to beginning finishing operations. See also "MONOLITHIC SLAB FINISHES" below.

M. Maintain reinforcing and embedded items in proper position during concrete placement operations. All reinforcement and embedded items shall be tied or secured in position prior to concrete placement. "Wet-Setting" of reinforcement or embedded items is not permitted.

N. Cold Weather Placing: Protect concrete work from physical damage or reduced strength which could be caused by frost, freezing actions, or low temperatures, in compliance with ACI 306 and as herein specified.
1. When air temperature has fallen to or is expected to fall below 40°F (4°C), uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50°F (10°C), and not more than 80°F (27°C) at point of placement.
2. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
3. Use only a non-corrosive, non-chloride accelerator. Calcium chloride, thiocyanates or admixtures containing more than 0.05% chloride ions are NOT permitted.
4. Cold weather may require lower proportions of pozzolans & slags be used in the cementitious mix.

O. Hot Weather Placing: When hot weather conditions exist that would seriously impair quality and strength of concrete, place concrete in compliance with ACI 305 and as herein specified.
1. Cool ingredients before mixing to maintain concrete temperature at time of placement below 90°F (32°C). Mixing water may be chilled, or chopped ice may be used to control temperature provided water equivalent of ice is calculated to total amount of mixing water. Use of liquid nitrogen to cool concrete is Contractor's option.
2. Cover reinforcing steel with water-soaked burlap if it becomes too hot, so that steel temperature will not exceed the ambient air temperature immediately before embedment in concrete.
3. Fog spray forms, reinforcing steel and subgrade just before concrete is placed.
4. Use water-reducing retarding admixture (Type D) when required by high temperatures, low humidity, or other adverse placing conditions.

P. Deflection: The concrete subcontractor shall provide additional concrete required to accommodate expected deflection of building structure, deck and/or formwork occurring during concrete placement.

3.11 FINISH OF FORMED SURFACES

A. Concrete mixes containing pozzolans or slags do not set at the same rate or with the same bleed water characteristic as plain Portland cement. Therefore attention must be directed to the proper procedures. Refer to ACI 232.2R-10 and ACI 301

B. Rough Form Finish: For formed concrete surface not exposed to view in the finish work or by other construction, unless otherwise indicated. This is the concrete surface having texture imparted by form facing material used, with tie holes and defective areas repaired and patched and fins and other projections exceeding 1/4" in height rubbed down or chipped off.

C. Smooth Form Finish: For formed concrete surfaces exposed-to-view, or that are to be covered with a coating material applied directly to concrete, or a covering material applied directly to concrete, such as waterproofing, damp-proofing, painting or other similar system. This is as-cast concrete surface obtained with selected form facing material, arranged orderly and symmetrically with a minimum of seams. Repair and patch defective areas with fins or other projections completely removed and smoothed. Follow all requirements in ACI 301, Chapter 10 for smooth form finish. Surface preparation for surfaces receiving waterproofing must be approved by the waterproofing manufacturer prior to construction.

3.12 FLOOR FLATNESS/LEVELNESS TOLERANCES

A. Ff defines the maximum floor curvature allowed over 24 in. Computed on the basis of successive 12 in. (300 mm) elevation differentials, Ff is commonly referred to as the "Flatness F-Number".

B. Fl defines the relative conformity of the floor surface to a horizontal plane as measured over a 10 ft. (3.05 m) distance commonly referred to as the "Levelness F-Number".

C. All floors shall be measured in accordance with ASTM E-1155 "Standard Test Method for Determining Floor Flatness and Levelness Using the "F Number" System (Inch-Pound Units).

D. All slabs shall achieve the specified overall tolerance. The minimum local tolerance (1/2 bay or as designated by the architect) shall be 2/3 of the specified tolerances.
E. Unless noted otherwise, Floor Flatness (Ff) and Floor Levelness (Fl) shall comply with the requirements set forth in ACI 302 “Guide For Concrete Floor and Slab Construction”, Figure 8.15.1.1 for no-slope slabs.

F. For sloping slabs tolerance shall be in accordance with ACI 117.

3.13 MONOLITHIC SLAB FINISHES

A. Float Finish: Apply float finish to slabs at crawl spaces or horizontal surfaces to be waterproofed or covered with concrete toppings or drainage courses, unless otherwise noted. After screeding, consolidating, and leveling concrete slabs, do not work surface until ready for floating. Begin floating when surface water has disappeared or when concrete has stiffened sufficiently to permit operation of power-driven floats, or both. Consolidate surface with power-driven floats, or by hand-floating if area is small or inaccessible to power units. Cut down high spots and fill low spots. Uniformly slope surfaces to drains. Immediately after leveling, refloat surface to a uniform, smooth, granular texture. Surface shall achieve an Ff 20 - Fl 17 tolerance.

B. Trowel Finish: Apply trowel finish to monolithic slab surfaces to be exposed-to-view, and slab surfaces to be covered with resilient flooring, carpet, ceramic or quarry tile, paint, or other thin film finish coating system, unless otherwise noted.
   1. After floating, begin first trowel finish operation using a power-driven trowel. Begin final troweling when surface produces a ringing sound as trowel is moved over surface. Consolidate concrete surface by final hand-troweling operation, free of trowel marks, uniform in texture and appearance and with a surface leveled to an Ff25/ Fl 20 tolerance (Fl 17 for elevated slabs). Grind smooth surface defects, which would telegraph through applied floor covering system.

C. Trowel and Fine Broom Finish: Where ceramic or quarry tile is to be installed with thin-set mortar, and slab surfaces which are to be covered with membrane or elastic waterproofing, or sand-bed terrazzo, and as otherwise indicated, apply single trowel finish as specified, then immediately follow with slightly scarifying surface by fine brooming. Surface preparation for surfaces receiving waterproofing must be approved by the waterproofing manufacturer prior to construction

D. Liquid Densifier: Apply a coat of the specified liquid densifier to all exposed interior concrete floors where indicated on the drawings. This surface must be continuously moist cured by a method satisfactory to the Architect. Apply and mechanically scrub compound into the floor in strict accordance with the manufacturer's printed instructions.

3.14 CONCRETE CURING AND PROTECTION
A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Submit for approval, the contractor's proposed curing and protection method.
1. Start initial curing as soon as free water has disappeared from concrete surface after placing and finishing. Weather permitting, keep continuously moist for not less than 7 days.
2. Begin final curing procedures immediately following initial curing and before concrete has dried. Continue final curing for at least 7 days in accordance with ACI 301 procedures. Avoid rapid drying at end of final curing period.
3. In order to avoid plastic or drying shrinkage cracks during warm, dry or windy weather, ACI 302 and ACI 308 shall be followed using wind breaks and sun shades when recommended. Evaporation retardant shall be as specified in Section 2.04.

B. Curing Methods: Perform curing of concrete by moist curing or moisture-retaining cover curing as preferred methods, or by using curing, sealing and hardening compound when that is not practical, or by combinations thereof, as herein specified.
1. Provide moisture curing by following methods.
   a. Keep concrete surface continuously wet by covering with water.
   b. Continuous water-fog spray.
   c. Covering concrete surface with specified absorptive cover, thoroughly saturating cover with water and keeping continuously wet. Place absorptive cover to provide coverage of concrete surfaces and edges, with 4" lap over adjacent absorptive covers.
2. Provide moisture-cover curing as follows: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width with sides and ends lapped at least 3" and sealed by waterproof tape or adhesive. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
3. Provide curing and sealing compound to exposed interior slabs not receiving a liquid densifier application, and to all troweled slabs receiving mastic applied adhesives or "shake-on" hardeners. Curing compounds shall be compatible with floor finishes toppings and/or adhesives to be applied. This compound shall also be used on exterior slabs, sidewalks and curbs not receiving a penetrating sealer.
4. Provide curing and hardening compound to walls receiving the specified waterproofing system. The compound must be applied immediately after form removal, unless the forms are left on for seven (7) days.

C. Curing Formed Surfaces: Cure formed concrete surfaces, including undersides of beams, supported slabs and other similar surfaces by moist curing with forms in place for full curing period or until forms are removed. If forms are removed, continue curing by methods specified above, as applicable.
D. Curing Unformed Surfaces: Cure unformed surfaces, such as slabs, floor topping, and other flat surfaces by application of the specified curing compound or a continuous moist curing method approved by the architect.

E. Sealer and Dustproofer: Apply a second coat of the specified curing and sealing compound to exposed interior slabs not subjected to vehicular traffic, noted on the drawings. These slabs must have received an initial coat of the curing and sealing compound.

3.16 REMOVAL OF FORMS

A. Formwork not supporting weight of concrete, such as sides of beams, walls, columns, and similar parts of the work, may be removed after cumulatively curing at not less than 50°F (10°C) for 24 hours after placing concrete, provided concrete is sufficiently hard to not be damaged by form removal operations, and provided curing and protection operations are maintained.

B. Formwork supporting weight of concrete, such as beam soffits, joints, slabs and other structural elements, may not be removed in less than 7 days or until concrete has attained 75% of the specified compressive strength. Determine potential compressive strength of in-place concrete by testing field-cured specimens representative of concrete location or members. The contractor shall notify the quality control testing agency 24 in advance in the event that field-cured specimens are required.

C. Form facing material may be removed 2 days after placement, only if shores and other vertical supports have been arranged to permit removal of form facing material without loosening or disturbing shores and supports and surfaces are treated for proper curing.

3.17 RE-USE OF FORMS

A. Clean and repair surfaces of forms to be re-used in work. Split, frayed, delaminated or otherwise damaged form facing material will not be acceptable for exposed surfaces. Apply new form coating compound as specified for new formwork.

B. When forms are intended for successive concrete placement, thoroughly clean surfaces, remove fins and laitance, and tighten forms to close joints. Align and secure joint to avoid offsets. Do not use "patched" forms for exposed concrete surfaces, except as acceptable to Architect.

3.18 MISCELLANEOUS CONCRETE ITEMS

A. Filling-In: Fill-in holes and openings left in concrete structures for passage of work by other trades, unless otherwise shown or directed, after work of other
trades is in place. Mix, place and cure concrete as herein specified, to blend with in-place construction. Provide other miscellaneous concrete filling shown or required to complete work.

B. Curbs: Provide monolithic finish to interior curbs by stripping forms while concrete is still green and steel-troweling surfaces to a hard, dense finish with corners, intersections and terminations slightly rounded.

C. Equipment Bases and Foundations: Provide machine and equipment bases and foundations, as shown on drawings. Set anchor bolts for machines and equipment to template at correct elevations, complying with certified diagrams or templates of manufacturer furnishing machines and equipment.

D. Grout base plates and foundations as indicated using specified non-shrink grout. Use non-metallic grout for exposed conditions, unless otherwise indicated. Where high fluidity and/or increased placing time is required using the specified high flow grout.

E. Steel Pan Stairs: Provide concrete fill for steel pan stair treads and landings and associated items. Cast-in safety inserts and accessories as shown on drawings. Screeds, tamp, and finish concrete surfaces as scheduled.

3.19 CONCRETE SURFACE REPAIRS

Prior to all repairs, an as-built condition sketch and method of repair must be submitted to the architect and engineer for review and approval.

A. Patching Defective Areas: Repair and patch defective areas with cement mortar immediately after removal of forms, when acceptable to Architect.

B. Cut out honeycomb, rock pockets, voids over 1/4" in any dimension, and holes left by tie rods and bolts, down to solid concrete but, in no case to a depth of less than 1". Make edges of cuts perpendicular to the concrete surface. Thoroughly clean, dampen with water, and brush-coat the area to be patched with a bonding grout containing the specified bonding admixture. Place patching mortar after while bonding grout is still tacky.

C. For exposed-to-view surfaces, blends white portland cement and standard portland cement so that, when dry, patching mortar will match color surrounding. Provide test areas at inconspicuous location to verify mixture and color match before proceeding with patching. Compact mortar in place and strike-off slightly higher than surrounding surface.

D. Repair of Formed Surfaces: Remove and replace concrete having defective surfaces if defects cannot be repaired to satisfaction of Architect. Surface defects, as such, include color and texture irregularities, cracks, spalls, air bubbles, honeycomb, rock pockets; fins and other projections on surface; and
stains and other discoloration's that cannot be removed by cleaning. Flush out form tie holes, fill with dry pack mortar, or pre-cast cement cone plugs secured in place with bonding agent.

E. Repair concealed formed surfaces, where possible, that contain defects that affect the durability of concrete. If defects cannot be repaired, remove and replace concrete.

F. Repair of Unformed Surfaces: Test unformed surfaces, such as monolithic slabs, for smoothness and verify surface plane to tolerances specified for each surface and finish. Correct low and high areas as herein specified. Test unformed surfaces sloped to drain for tureens of slope, in addition to smoothness, using a template having required slope.

G. Repair finished unformed surfaces that contain defects, which affect durability of concrete. Surface defects, as such, include crazing, cracks in excess of 0.01" wide or which penetrate to reinforcement or completely through non-reinforced sections regardless of width, spalling, pop-outs, honeycomb, rock pockets, and other objectionable conditions shall be repaired.

H. Correct high areas in unformed surfaces by grinding, after concrete has cured at least 14 days, except at hydrostatic slabs.

I. Correct low areas in unformed surfaces during or immediately after completion of surface finishing operations by cutting out low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete. The specified underlayment compound or repair topping may be used when acceptable to Architect.

J. Repair defective areas, except random cracks and single holes not exceeding 1" diameter, by cutting out and replacing with fresh concrete. Remove defective areas to sound concrete with clean, square cuts and expose reinforcing steel with at least 3/4" clearance all around. Dampen concrete surfaces in contact with patching concrete and apply bonding compound. Mix patching concrete of same materials to provide concrete of same type or class as original concrete. Place, compact and finish to blend with adjacent finished concrete. Cure in the same manner as adjacent concrete.

K. Repair isolated random cracks and single holes not over 1" in diameter by dry-pack method. Groove top of cracks and cutout holes to sound concrete and clean of dust, dirt and loose particles. Dampen cleaned concrete surfaces and apply bonding compound. Mix dry-pack, consisting of one part portland cement to 2-1/2 parts fine aggregate passing a No. 16 mesh sieve, using only enough water as required for handling and placing. Place dry-pack after bonding compound has dried. Compact dry-pack mixture in place and finish to match adjacent concrete. Keep patched area continuously moist for not less than 72 hours.
L. Structural Repair: All structural repairs shall be made with prior approval of the Engineer as to method and procedure, using the specified polymer repair mortar and/or specified epoxy adhesive. Where epoxy injection procedures must be used, an approved low viscosity epoxy made by the manufacturers previously specified shall be used. All garage slabs shall be repaired prior to the slab being treated with the specified penetrating anti-spalling sealer. In addition, all cracks shall be filled with the specified crack sealer or other method as approved by the Engineer.

M. Underlayment Application: Leveling of floors for subsequent finishes may be achieved by use of specified underlayment material. Underlayment application shall achieve the tolerances specified in "MONOLITHIC SLAB FINISHES" above.

N. Specified Polymer Horizontal Repair Mortar: All exposed floors shall be leveled, where required, with the specified self-leveling repair topping.

O. Repair Methods not specified above may be used, subject to acceptance of Architect.

3.20 FOUNDATION WALLS

A. Form and leave openings in walls as shown on drawings and approved shop drawings for work of other contractors. These openings shall be temporarily closed and when so directed, the contractor shall point up in solid and neat manner with waterproofed cement.

3.21 WORK IN CONNECTION WITH OTHER TRADES AND CONTRACTS

A. Sleeves, pockets, openings, etc., shall be set in the concrete walls and arches as required for the mechanical trades as shown on approved shop drawings; these shall be encased or built into the concrete work and shall be properly placed and secured in position in the forms before concrete is placed. Provide additional reinforcing around all penetrations in walls and slabs as shown on the contract drawings.

B. Provide all chases, pipe slots, etc., required for the mechanical trades (see mechanical drawings), constructed as shown on the approved shop drawings.

C. Leave temporary access panels where required to install mechanical equipment as required by trade affected. Panels shall be formed with construction joints as specified. Details for such panels shall be submitted to Architect for approval.

D. Coordinate all penetrations, cutting, and patching with waterproofing contractor.

E. Moisture Vapor Emission Rates (MVER): Concrete slabs to receive specialty floor finishes shall meet all moisture vapor emission rates and curing
requirements necessary for satisfactory installation of the floor systems indicated. Acceptable values for MVER and testing methods for determining acceptability of MVER shall be in accordance with the flooring manufacturer’s requirements.

3.22 CUTTING AND PATCHING

A. Contractor for concrete work shall be responsible for all cutting, removing and patching work where concrete surfaces are not installed within the limits shown on the drawings or specified herein. All such work shall meet with the approval of the Architect/Engineer.

B. The location and extent of cutting and patching in concrete work shall be submitted for review and approval by the Architect/Engineer.

3.23 QUALITY CONTROL TESTING DURING CONSTRUCTION

A. The Owner will employ a third party testing laboratory to perform tests and to submit test reports.

B. Sampling and testing for quality control during placement of concrete may include the following, as directed by Architect.

1. Sampling Fresh Concrete: ASTM C 172, except modified for slump to comply with ASTM C 94.
2. Slump: ASTM C 143; one test at point of discharge when taking test cylinders or when concrete quality is suspect; additional tests when concrete consistency seems to have changed.
3. Air Content: ASTM C 173, volumetric method for lightweight or normal weight concrete, measured at point of placement.
4. Concrete Temperature: Test hourly when air temperature is 40°F (4°C) and below, and when 80°F (27°C) and above; and each time a set of compression test specimens made.
5. Compression Test Specimen: ASTM C 31; one set of 4 standard cylinders for each compressive strength test, unless otherwise directed. Mold and store cylinders for laboratory cured test specimens except when field-cure test specimens are required.
6. Compressive Strength Tests: ASTM C 39; one set for each day’s pour exceeding 5 cu. yds. (for each class of concrete) plus additional sets for each 100 cu. yds. over and above the first 5 cu. yds. of each concrete class placed in any one day; one specimen tested at 7 days, two specimens tested at 28 days, and one specimen tested at 56 days or to be withheld at the direction of the architect.
   a. When frequency of testing will provide less than 5 strength tests for a given class of concrete, conduct testing from at least 5 randomly selected batches or from each batch if fewer than 5 are used.
b. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, evaluate current operations and provide corrective procedures for protecting and curing the in-place concrete.

c. Strength level of concrete will be considered satisfactory if averages of sets of three consecutive strength test results equal or exceed specified compressive strength, and no individual strength test result falls below specified compressive strength by more than 500 psi.

6. Water Cement Ratio Test: Check water content of hardened concrete that is suspect in quality in accordance with ‘Standard Method of Test for Water Content of Freshly Mixed Concrete Using Microwave Oven Drying, AASHTO DESIGNATION: TP 23, SHRP DESIGNATION: 2027’.

7. Unit Weight Test: In accordance with ASTM C138. Complete one test a day for 100 yards or more.

9. Test results will be reported in writing to Architect, Structural Engineer and Contractor within 24 hours after tests. Reports of compressive strength tests shall contain the project identification name and number, date of concrete placement, name of concrete testing service, concrete type and class, location of concrete batch in structure, design compressive strength at 28 days, concrete mix proportions and materials; compressive breaking strength and type of break for both 7-day tests and 28-day tests.

1. Non Compliance: All test reports indicating non-compliance shall be faxed immediately to all parties on the test report distribution list and the hard copies submitted on different colored paper.

2. Nondestructive Testing: Windsor probes, rebound hammer, sonoscope, or other non-destructive device may be permitted but shall not be used as the sole basis for acceptance or rejection.

10. Additional Tests: The testing service will make additional tests of in-place concrete when test results indicate specified concrete strengths and other characteristics have not been attained in the structure, as directed by Architect. Testing service may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42, or by other methods as directed. Contractor shall pay for such tests and retesting when unacceptable concrete is verified.

END OF SECTION 03300
SECTION 03 30 53 - MISCELLANEOUS CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. The work specified in this Section consists of designing mix, furnishing, placing, and curing Portland Cement concrete, reinforced and unreinforced, as indicated.

1.2 RELATED SECTIONS

A. Section 03 11 00: Concrete Forming.

B. Section 03 20 00: Concrete Reinforcing.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's descriptive product data and current specifications for the concrete accessories specified herein. Include installation instructions.

B. Samples: Submit samples of materials being used when requested by the Engineer including names, sources, and descriptions.

C. Design Mix: Prior to production of concrete, submit for approval, on form attached at the end of this Section, all mix designs proposed for project. Include with the mix design a standard deviation analysis or trial mixture test data in accordance with ACI 301 Section 4.2.3. Use materials in such proposed design mix as specified herein. Make such adjustments in the proposed design mix as directed by the Engineer. Make such adjustments at no increase in contract price.
1. Water shall not be added to concrete mix at the project site unless it is withheld from the mix at the batch mixing plant. Indicate amounts of mix water to be withheld for later addition at project site.

D. Test Reports:
1. Submit concrete test reports specified in Part 3 in this Specification.

E. Certificates:
1. Furnish certificates originated by the batch mixing plant certifying ready mixed concrete, as manufactured and delivered, to be in conformance with ASTM C 94.

F. Delivery Tickets: A delivery ticket shall accompany each load of concrete from the batch plant.
1. Tickets must be signed by the Contractor's representative, noted as to time and place of pour, and kept in a record at the site. Make such records available for inspection upon request.
2. Information presented on the ticket to include the tabulation covered by ASTM C 94, Section 16, as well as any additional information the local codes may require.

G. Schedule: Submit schedule showing methods, construction joint locations, and sequence of pouring a minimum of 10 days prior to placing concrete.
1.5 QUALITY ASSURANCE TESTING

B. Source Quality Control:
   1. Laboratory Tests: Materials stated herein require advance examination or testing according to methods referenced, or as required by the Engineer.
   2. Compression Test Cylinders: For laboratory trial batches, make in accordance with American Concrete Institute ACI 301. Test to consist of four compression test cylinders for each class of concrete with two broken at seven days and two broken at 28 days; ASTM C 192 and ASTM C 39.

C. Pre-Job Meeting: Prior to placement of concrete, a meeting shall occur on site to establish and coordinate procedures that will enable Contractor to provide the best possible product under anticipated field conditions. The meeting should be attended by representatives of organizations and material suppliers involved with the design and construction of floor slab.

1.6 PROJECT CONDITIONS

A. ACI Compliance: Cast-in-place concrete work shall conform to ACI 301 except as modified by these Specifications or the Drawings.

B. Concrete Encasement of Pipes and Conduits: Encase pipes under structures and buildings indicated by the Drawings to be encased in concrete for the full length of the pipe run under the structure.

C. Concrete Encasement of Conduits: Encase conduit runs as indicated and detailed on the Drawings as work of Division 16 – Electrical Sections.

D. Equipment Bases: Construct reinforced concrete bases for equipment and piping under this contract at no increase in contract price.

1.7 SEQUENCING

A. Where other construction work is relative to concrete pours, or must be supported by or embedded in concrete, those performing such related work must be given five days notice to introduce or furnish embedded items before concrete is placed.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Cement:
   2. Only one brand and manufacturer of approved cement shall be used for exposed concrete.

B. Normal weight Concrete Aggregates: Process aggregate meeting requirements of ASTM C 33 and subject to the following limitations.
   1. Coarse Aggregate Size: Maximum size of coarse aggregate shall not exceed the following requirements but in no case larger than 1½ inches.
      a. One-fifth narrowest dimension between sides of forms within which concrete is to be cast.
b. Three-fourths of the minimum clear spacing between reinforcing bars.
c. One-third the slab thickness for unreinforced slabs.
d. Reduced aggregate concrete containing aggregate with particle size not less than
   1/8 inch nor more than 1/2 inch in any dimension and a maximum of 5 percent of
   particles passing a No. 8 sieve (for use in metal pan stairs only).

C. Ground Granulated Blast-Furnace Slab (GGBFS): Conform to ASTM C 989, Grade 120.
   1. Use GGBFS at the rate of 25% (min) to 35% (max) of the total cementitious material.

D. Water: Clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials, or
   other substances that may be deleterious to concrete or reinforcement.

E. Concrete Admixtures:
   1. Prohibited Admixtures: Use only non-corrosive, non-chloride admixtures.
   2. Provide admixtures produced and serviced by established, reputable manufacturers and
      use in compliance with manufacturer's recommendations.
   4. Water-Reducing Admixture: Use a product conforming to requirements of ASTM C 494
      Type A. (Use this for all concrete except where an admixture listed below is used).
      a. Acceptable Manufacturers:
         1) Eucon WR-75; The Euclid Chemical Company.
         2) Pozzolith 220N; Master Builders.
         3) Plastocrete 161; Sika Corporation.
         4) Or approved equal.
   5. Water-Reducing and Retarding Admixture: Use a product conforming to requirements of
      ASTM C 494, Type D.
      a. Acceptable Manufacturers:
         1) Eucon Retarder-75; The Euclid Chemical Company.
         2) Pozzolith 100XR; Master Builders.
         3) Plastiment; Sika Corporation.
         4) Or approved equal.
   6. Water-Reducing, and Acceleration Admixture: Use a product conforming to requirements
      of ASTM C 494, Types C or E.
      a. Acceptable Manufacturers:
         1) Accelguard 80; The Euclid Chemical Company.
         2) Pozzutec 20; Master Builders.
         3) Plastocrete 161 FL; Sika Corporation.
         4) Or approved equal.
   7. High-Range, Water-Reducing Admixture: Use a Product Conforming to Requirements of
      ASTM C494, Type F.
      a. Acceptable Manufacturers:
         1) Eucon 1037; The Euclid Chemical Company.
         2) Pozzolith 400N; Master Builders.
         3) Sikament 2000; Sika Corporation.
         4) Or approved equal.
   8. Store admixtures in a manner to prevent contamination, evaporation, moisture
      penetration, or damage. Do not use products, which have been stored longer than 6
      months.
   9. Prior to the mix design review by the Engineer, provide written conformance to the
      specified requirements of the admixture.

F. Preformed Expansion Joint Fillers:
   1. Nonextruding and Resilient Bituminous Types (for exterior use in pavements and
      sidewalks only): ASTM D 1751.
4. Acceptable Manufacturers:
   a. Tamms Industries, Inc.
   b. W.R. Meadows, Inc.
   c. Or approved equal.

G. Curing Materials. Use curing materials that will not stain or affect concrete finish or lessen the concrete strength and comply with the following requirements:
   3. Liquid Membrane-Forming Curing Compound.
      a. Use curing compounds which are nontoxic and free of taste, odor and comply with low V.O.C. requirements.
      b. Where a finish material is to be applied over concrete with architectural finish, provide certification by the product manufacturer stating the curing compound as non-detrimental to the bond of the finish material.
      c. Use material meeting the requirements of ASTM C 309, Type 1.
      d. Acceptable Manufacturers:
         1) L&M Cure; L&M Construction Chemicals, Inc.
         2) Masterkure 200W; Master Builders.
         3) Or approved equal.

H. Epoxy Bonding Compound: A high-modulus, low-viscosity, moisture-insensitive epoxy adhesive having the following properties:
   1. Compressive Properties, ASTM D 695 at 28 days;
      a. Compressive Strength: 8,000 psi. min.
   2. Tensile Properties, ASTM D 638 at 14 days.
      a. Tensile Strength: 4,000 psi. min.
      b. Elongation at Break: One to three percent.
      c. Modulus of Elasticity: $3 \times 10^5$ psi.
   3. Bond Strength, ASTM C 882:
      a. Plastic concrete to hardened concrete at 14 days (moist cure): 1,700 psi. min.
   4. Mixed epoxy resin adhesive shall conform to ASTM C 881, Type II, Grade 2, Class B and C.
   5. Acceptable Manufacturers:
      a. Sikadur 32 Hi-Mod; Sika Corporation.
      b. Euco Epoxy #452 MV or #620; Euclid Chemical Company.
      c. Or approved equal.

I. Epoxy Adhesive (for grouting dowels): A high-modulus, moisture insensitive epoxy adhesive of thick (Gel) consistency having the following properties:
      a. Compressive Strength: 10,000 psi. min. at 28 days.
   2. Tensile Properties, ASTM D 638.
      a. Tensile Strength: 3,000 psi. min. at 14 days.
      b. 14-day, moist cure: 2,000 psi. min.
   3. Bond Strength, ASTM C 882, hardened concrete to hardened concrete:
      a. Mixed epoxy resin adhesive shall conform to ASTM C 881, Type I, Grade 3, Class B and C.
   4. Acceptable Manufacturers:
      a. Sikadur 31 Hi-Mod Gel; Sika Corporation.
      b. Euco Epoxy #452 Gel or #620 Gel; Euclid Chemical Company.
      c. Or approved equal.

J. Vinyl Waterstops: Ribbed type manufactured from virgin polyvinyl chloride plastic compound conforming to U.S. Corps of Engineers CRD-C 572.
   1. Construction Joint: Flat ribbed 6 x 3/8 inch; such as Vinylex Corporation; Cat. No. R6-38.
2. Expansion Joint: Ribbed center buld 9 x 3/8 inch; center buld of 1 ½-inch outside diameter such as Vinylex Corporation. Cat. No. RLB9-38.

3. Acceptable Manufacturers:
   a. Vinylex Corporation (Catalog Nos. as specified above).
   b. Tamms Industries, Inc.
   c. W.R. Meadows, Inc.
   d. Or approved equal.

4. Retro-fit waterstop: 6 x 3/8-inch with 3 3/16-inch T-leg such as Greenstreak Product No. 609 or approved equal.

K. Surface Applied Waterstop: A specially formulated joint sealant, which swells upon contact with water. Provide waterstop packaged in continuous length coils. Material composition as follows:

1. Chloroprene rubber and chloroprene rubber modified to impart hydrophilic properties.
2. Waterstop shall have a coating formulated to inhibit initial expansion due to moisture presence in the fresh concrete.
3. Size: Dual extrusion design; 10 mm by 20 mm.
4. Waterstop shall be secured to hardened concrete with the waterstop manufacturer’s standard adhesive binder.

5. Acceptable Manufacturers:
   a. Greenstreak; Hydrotite VCJ.
   b. ADECA; Ultradeal.
   d. Or equal.

L. Construction Joint Device: Integral galvanized steel formed to tongue and groove profile.

1. For exposed concrete areas, provide plastic joint cap strip that can be removed for placement sealant.
2. Use only in slabs that do not retain water.
3. Acceptable Manufacturers:
   a. Burke Company
   b. Heckman Building Products, Inc.
   c. Or approved equal.

M. Contraction Joint Insert: Two-piece plastic preassembled preformed contraction joint; depth of embedment equal to ¼ of the slab thickness.

1. Acceptable Manufacturers:
   a. Burke Company: Burke Zip Strip.
   c. Or approved equal.

N. Construction and Control Joint Filler for Slab-on-Grade: A two-component epoxy joint filler.

1. Acceptable Manufacturers:
   a. Sika Corporation: Sikadur 51 Sl.
   b. Euclid Chemical Company: Euro 700.
   c. Master Builders: Masterfill 300.
   d. Or approved equal.

2.2 MIXES

A. Selection of Proportions of Normal weight Concrete: ACI 211.1.
B. Proportions of Ingredients: Establish proportions, including water-cement ratio on the basis of either laboratory trial mixture tests or standard deviation analysis, with the materials specified herein.
   1. Laboratory Trial Mixture Test: ACI 301, Section 4.2 and ACI 318, Section 5.3.
   2. Standard Deviation Analysis: ACI 301, Section 4.2 and ACI 318, Section 5.3.

C. Water-Cement Ratio:
   1. Class A Concrete shall have a maximum water-cement ratio of 0.45.
   2. Class B Concrete shall have a maximum water-cement ratio of 0.55.
   3. Proportion Class C Concrete to meet the strength requirement.

D. Slump: Proportion and produce concrete to a slump as indicated below. The slump ranges apply when vibration is used to consolidate the concrete.

<table>
<thead>
<tr>
<th>Types of Construction</th>
<th>Maximum*</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reinforced foundation walls and footings</td>

<td>Pavements and slabs-on-grade</td>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

* May be increased 1 in. for methods of consolidation other than vibration.

1. Pumped concrete shall have a 5-inch maximum slump, measured prior to pumping.
2. Concrete containing high-range water-reducing admixture shall have an 8-inch maximum slump after admixture is added to concrete with a 2- to 4-inch slump.

2.3 ADMIXTURES

A. Air Entraining: Provide air-entrained concrete for each concrete pour except where indicated otherwise on the Drawings or specified herein. Total air content required as follows:
   1. Maximum-size coarse aggregate, inches: Air content percent by volume:
      1 1/2 5 +/- 1
      3/4 or 1 6 +/- 1

B. Water-Reducing Admixture: Unless high temperatures occur or placing conditions dictate a change, use concrete containing a water-reducing admixture.

C. Water-Reducing and Retarding Admixture: When high temperatures occur or placing conditions dictate, the water-reducing admixture (Type A) may be replaced with a water-reducing and retarding admixture (Type D). Notify the Engineer of such change and submit product data prior to placement of concrete.

D. Water-Reducing and Accelerating Admixture: When low temperatures occur or placing conditions dictate, the water-reducing admixture (Type A) can be replaced with a water-reducing and accelerating admixture. Notify the Engineer of such change and submit product data prior to placement of concrete.

2.4 SOURCE QUALITY CONTROL

A. General Requirement: Provide only Class A concrete in the project except for those cases where indicated otherwise on the Drawings or specified otherwise.
1. Where in-ground encasement of piping is required, provide Class B concrete.
2. Where in-ground encasement of conduit runs is required provide Class B concrete.
3. Where reaction backings and backfilling of over excavated foundation area, foundation voids, and cavities are required, provide Class B concrete.
4. For backfilling of overexcavated foundation area, foundation voids and cavities, provide Class B concrete.

B. Classes of Concrete:
1. Class A: 4,000 psi minimum compressive strength at 28 days; 564 pounds per cubic yard minimum cement content.
2. Class B: 3,000 psi minimum compressive strength at 28 days; 517 pounds per cubic yard minimum cement content.
3. Class C: 2,000 psi minimum compressive strength at 28 days; minimum cement content per cubic yard in accordance with current ready-mix plant standard practice.

PART 3 - EXECUTION

3.1 INSPECTION
A. Inspect work to receive cast-in-place concrete for deficiencies, which would prevent proper execution of the finished work. Do not proceed with placing until such deficiencies are corrected to the satisfaction of the Construction Manager.

3.2 PREPARATION
A. Joints
1. General: Only the locations of critical joints throughout the structures are indicated on the Drawings. Select additional joint locations in walls and footings subject to the Engineer’s approval. Submit requests for approval of joint locations ten days prior to scheduled concrete pours. Do not make concrete pours unless joint locations have been approved by the Engineer.
   a. Place walls and slabs allowing at least two days elapsed time before concrete is placed against an adjacent vertical joint.
2. Construction Joints in Walls and Foundations: Placement of additional joint locations shall meet the following:
   a. Locate such joints to least impair the strength of the structure.
   b. The horizontal length between joints in footings and grade beams shall not exceed 60 feet.
   c. The horizontal length between wall joints shall not exceed 30 feet in a continuous wall. At corners or other intersections of two or more walls, provide a joint in each wall at a distance less than 15 to 20 feet from the intersection point in all directions. Align joints with those placed in footings or offset joints a minimum distance of 5 feet.
   d. When concreting is to be discontinued for more than 45 minutes, install keyways and embed dowels in the concrete before initial hardening. Horizontal joints are not permitted in slabs or footings.
      1) Place dowels in joint one splice length into concrete section and one splice length into next concrete pour.
   e. No exceptions permitted to the above requirements unless written approval is given by the Engineer.
3. Expansion Joints in Walls:
   a. Install where indicated on the Contract Drawings.
   b. Do not extend reinforcing or other embedded metal items through expansion joint except where indicated otherwise on Contract Drawings.
4. Construction Joints in Elevated (Suspended) Formed Slabs: Placement of additional joint locations shall meet the following:
    a. Locate such joints to least impair the strength of the structure.
    b. Space construction joints not greater than 30 feet in each direction, although some adjustments, as approved by the Engineer, may be permitted. Reinforcement shall continue through construction joint.
    c. Joints shall be located within the third point of slab span. Joints in girders should be offset a minimum distance of two times the width of any intersecting beam.
    d. Beams, girders, or slabs supported by columns or walls shall not be cast or erected until concrete in the vertical support members is no longer plastic.
    e. Where concreting is interrupted long enough for concrete to be hardened, install keyway and embed dowels in the concrete before initial hardening.
       1) Place dowels in joint one splice length into slab and one splice length into next concrete pour.
       2) Dowel to be spliced with top and bottom reinforcement; size of dowels to match slab reinforcement.
    f. Provide PVC waterstop in joint where such joints are exposed to liquids, in contact with earth, or subject to weather exposure.

5. Control Joints and Construction Joints in Slab-on-Grade:
    a. Provide control joint spacing at the following maximum spacing unless noted otherwise:
       1) 5 inch slab: 15 feet each way
       2) 6 inch slab: 18 feet each way
       3) 7 inch slab: 21 feet each way
    b. Where contraction joint insert is used, press straight edge cutting tool into wet concrete to part aggregate. Place insert into separation until top of insert lays on surface of wet concrete. Remove top section of insert and float concrete to fill voids adjacent to the insert and finish concrete surface.
    c. Sawcutting is permitted for control joints. Cut concrete as soon as it has hardened sufficiently; complete sawing within 12 hours after placement. Saw a continuous straight slot to a depth of one-fourth the thickness of the slab.
       1) Submit detailed procedure plans for review and acceptance.
    d. Fill all control joints with Control Joint Filler.
    e. Where concreting is interrupted long enough for the placed concrete to harden, construction joint should be provided.

6. Bonding to New Concrete: Bond fresh concrete with hardened previously poured new concrete in accordance with the following:
    a. Roughen and clean hardened concrete to foreign matter and laitance and dampen with water.
    b. Cover the hardened concrete with a heavy coating of grout to approximately ½ inch thickness. Use grout of same material composition and proportions of concrete being poured except coarse aggregate omitted. Use grout with a slump of 6 inches minimum.
    c. Place new concrete on grout before it has attained its initial set.
    d. Other bonding methods must be approved by Engineer prior to use.

B. Embedded Items:
    1. Embedded Pipes and Conduits: Material not harmful to concrete may be permitted to be embedded in concrete upon approval by the Engineer. Items embedded shall satisfy the following:
       a. Maximum outside dimension not greater than one-third the overall thickness of the member in which it is embedded.
       b. Minimum spacing between items not less than 3 widths on center nor 3 inches clear between items.
       c. Item shall not impair strength of member.
       d. Provide 2-inch minimum clearance to face of slab.
e. Cutting, bending, or displacement of reinforcement will not be allowed.

2. Anchor Rod Placement:
   a. Install anchor rods accurately, vertically and horizontally, in the foundations as shown on the Contract Drawings.
   b. Insure rods are firmly held in the correct position and elevation by suitable templates during placement of concrete.
   c. The variation in location of anchor rods and other embedded items from the dimensions shown on the Contract Drawings shall meet the tolerances listed in "Code of Standard Practice for Steel Buildings and Bridges (March 2000)."

3. PVC Waterstops:
   a. Install in all joints where watertightness is required. Provide in joints exposed to liquids, in contact with earth, or subject to weather exposure.
   b. Use continuous lengths without splices where possible.
   c. Provide factory-formed and tested waterstop corners and intersections leaving only straight butt joint splice in field.
   d. Connect all adjoining waterstops including vertical and horizontal runs to provide continuous water barrier.
   e. Splices:
      1) Strength: Not less than 50% of the mechanical strength of the parent section.
      2) Watertightness: Make equal to that of continuous material.
      3) Heat seal adjacent surfaces in accordance with manufacturer’s recommendations using a thermostatically controlled electric source of heat that provides sufficient heat to melt but not to char the material.
   f. Adequately support waterstops to prevent displacement and deformity of the waterstops during concrete pours. Maintain two-inch minimum clearance between waterstop and reinforcing steel.
   g. Center waterstop on joint with one-half of waterstop width to be embedded in concrete on each side of joint at expansion joints. Keep center bulb unembedded.
   h. In substructures and other structures required to be watertight, install waterstops if concreting is discontinued for a sufficient length of time, which in the opinion of the Engineer, may result in seepage cracks in concrete.

4. Surface Applied Waterstop Installation: Install surface applied waterstop at such location indicated on the Drawings.
   a. Install the waterstop in strict accordance with the manufacturer’s installation instructions.

C. Anchoring Reinforcement Dowels into Existing Concrete.
   1. Drill holes for each dowel to the size and depth indicated on the Drawings with carbide tip bit or star bit, core drilling not permitted. Do not drill into or cut or otherwise damage existing reinforcement bars. If existing reinforcement bars are encountered during the drilling operation, relocate the hole to clear the existing reinforcement as directed by the Engineer.
   2. Blow clean each finished hole with an oil free air jet and then flush with a jet of clean water.
   3. Immediately prior to the grouting operation, remove all water from the hole and from the walls of the hole.
   4. Mix and place the epoxy adhesive completely around the dowel bar in strict accordance with the manufacturer’s recommendations, with particular attention given to manufacturer’s specified time limit within which the material must be placed after mixing. Do not retemper grout that has begun to stiffen; discard such grout.

3.3 CONSTRUCTION

A. Production of Concrete
   1. Ready-Mixed Concrete:
a. Batched, mixed, and transported in accordance with ASTM C 94.
b. Add admixtures to the mix in accordance with ACI 301.
c. Plant equipment and facilities conforming to the "Check List for Certification of Ready Mixed Concrete Production Facilities" of the National Ready Mixed Concrete Association.

B. Placing:
   1. General: Conduct placement work in accordance with ACI 304R and such additional requirements as specified herein.
      a. Complete discharge of the concrete within 1½ hours or before the mixing drum has revolved 300 revolutions; whichever comes first, after the introduction of the mixing water to the cement and aggregates or the introduction of the cement to the aggregates.
   2. Preparation:
      a. Prepare formwork in advance and remove snow, ice, water, and debris from within forms.
      b. Pre-position reinforcement in advance of concrete pours.
      c. Pre-position waterstops, expansion joint materials, anchors and embedded items in advance of concrete pours.
      d. Sprinkle subgrades sufficiently to eliminate water loss from concrete in accordance with ACI 301 Chapter 11.
         1) Subgrade shall be moist with no free water and no muddy or soft spots.
      e. Do not place concrete on frozen surfaces.
      f. Place vapor barrier under slabs-on-grade per requirements of Division 7 Specification Section “Building Insulation.”
   3. Conveying:
      a. Handle concrete from mixer to final deposit rapidly by methods, which will prevent segregation or loss of ingredients to maintain required quality of concrete.
      b. Do not convey concrete through aluminum or aluminum alloy.
      c. Do not place concrete by pumps or other similar devices without prior written approval of the Engineer.
      d. Placing concrete by pumping methods shall conform to the applicable requirements of ACI 304R, Chapter 9, and ACI 304.2R.
   4. Depositing:
      a. Do not drop concrete freely where reinforcing will cause segregation, nor more than four (4) feet.
      b. Deposit concrete in approximately horizontal layers of 12 to 18 inches.
      c. Do not allow concrete to flow laterally more than three feet.
      d. Place concrete at such a rate that concrete which is being integrated with fresh concrete is still plastic.
      e. Do not deposit concrete on concrete, which has hardened sufficiently to cause the formation of seams or planes of weakness within sections.
      f. Do not use concrete, which has partially hardened or has been contaminated by foreign materials.
      g. Do not subject concrete to procedures, which will cause segregation.
      h. Do not place concrete in forms containing standing water.
      i. Make placement within sections continuously to produce monolithic unit.
      j. Do not bend reinforcement out of position when placing concrete.
   5. Consolidation:
      a. Consolidate concrete by vibration, spading, rodding, or other manual methods. Work concrete around reinforcement, embedded items and into corners; eliminate all air or stone pockets and other causes of honeycombing, pitting or planes of weakness.
      b. Use vibration equipment of internal type and not the type attached to forms and reinforcement.
c. Use vibrators capable of transmitting vibration to concrete in frequencies sufficient to provide satisfactory consolidation.
d. Do not leave vibrators in one spot long enough to cause segregation. Remove concrete segregated by vibrator operation.
e. Do not use vibrators to spread concrete.
f. Have sufficient reserve vibration equipment to guard against shutdown of work occasioned by failure of equipment in operation.

6. Cold Weather Concreting: Perform cold weather concrete work in accordance with ACI 306R and the following additional requirements:
   a. Temperatures of the subbase and other surfaces that come in contact with concrete must be above freezing. The subbase and concrete forms surface must be free of snow and ice.
   b. Do not place concrete around any embedment, which has a temperature below freezing.
   c. Provide equipment for heating concrete materials and protecting concrete during freezing or near-freezing weather. Do not use foreign materials or materials containing snow or ice.
      1) When using artificial heat, vent exhaust gases to the outside.

7. Hot Weather Concreting: Perform hot weather concrete work in accordance with ACI 305R and the following additional requirements.
   a. Temperature of concrete delivered at the job-site shall not exceed 90 degrees F.
   b. Cool ingredients before mixing to prevent temperature in excess of 90 degrees F.
   c. Make provisions for windbreaks, shading, fog spraying, sprinkling or wet cover when necessary.

C. Finishing:
1. General: Finish concrete in the various specified manners either to remain as natural concrete or to receive an additional applied finish or material.
   a. Concrete containing ground granulated blast furnace slag may have longer time of set compared to 100 percent Portland Cement concrete.

2. Formed Surfaces: Provide one or more of the following finishes to the surfaces of the concrete after removal of forms. The locations where these finishes are required are listed herein or specified on the Drawings. Allowable surface irregularities are designed as either "abrupt" or "gradual." Check gradual irregularities using 5-foot straightedges.
   a. "Rough Form" finish: Surface may include roughness and irregularities not to exceed 1/2 inch, but tie holes and defects shall be patched.
   b. "Ordinary Wall" finish: Surface that is true and uniform without any conspicuous offsets or bulges. Gradual irregularities not to exceed 1/2 inch and abrupt irregularities not to exceed 1/4 inch.
   c. "Plywood" finish: Similar to the ordinary wall finish. Construct the surface of the forms using 5/8-inch plywood or boards lined with tempered hardboard not less than 3/16 inch thick. Place the plywood or liner sheets in an orderly and symmetrical arrangement using sheets as large as practicable. Do not use sheets showing torn grain, worn edges, patches of holes from previous use, or other defects, which will impair the texture of the concrete surfaces. Remove gradual irregularities exceeding 1/2 inch and abrupt irregularities exceeding 1/8 inch. Completely remove all fins on the surface. Rub all surfaces, which cannot meet these requirements.

3. Unformed Surfaces: In concrete having unformed surfaces, use just sufficient mortar to avoid the necessity for excessive floating. Slope exposed unformed surfaces to provide...
quick, positive drainage and to avoid puddles in low spots. Slope all surfaces exposed to weather 1/4 inch per foot for drainage unless noted otherwise on Drawings.

a. "Floated" Finish: After concrete has been placed, consolidated, struck off, and leveled, do not work further until ready for floating. Begin floating when water sheen has disappeared and when the surface has stiffened sufficiently to permit the operation. During or after first floating, check planeness of surface with a ten-foot straightedge applied at not less than two different angles. Cut down high spots and fill low spots during this procedure to produce a surface with true planes within 1/4 inch in ten feet as determined by a ten foot straightedge placed anywhere on the slab in any direction. Following straightedge checking, refloat slab immediately to a uniform sandy texture.

b. "Steel Trowel" Finish: Obtained by working a floated finish with a steel trowel. First troweling shall produce a smooth surface which is relatively free of defects but which may still show some trowel marks. Perform additional trowelings by hand after the surface has hardened sufficiently. Perform final troweling when a ringing sound is produced as the trowel is moved over the surface. Thoroughly consolidate surface by hand trowel operations. Produce finished surface essentially free of trowel marks, uniform in texture and appearance, with true planes within 1/4 inch in ten feet, as determined by a ten foot straightedge placed anywhere on the slab in any direction.

c. "Broom or Belt" Finish: Immediately after concrete has received a floated finish, give surface a coarse transverse scored texture by drawing a broom or burlap across the surface.

d. "Nonslip" Finish: The surfaces shall be given a "dry shake" application of non-slip aggregate surfacer. The rate of application of such material not to be less than 25 pounds per 100 square feet. Apply in accordance with manufacturer's recommendations.

4. Application for Finishes: Except where the type of finish is indicated on the drawings or under “Special Finish,” all concrete surfaces shall be finished as indicated below.

a. "Rough Form" Finish:
   1) All surfaces to be covered by earth.

b. "Ordinary Wall" Finish:
   1) Interior and exterior wall surfaces not exposed to view.
   2) Undersides of slabs which will be covered by Architectural ceiling.

c. "Plywood" Finish:
   1) All surfaces to be painted.

d. "Rubbed" Finish:
   1) All interior and exterior surfaces exposed to view, which are not to be painted.
   2) All exterior surfaces to a point 6 inches below finished ground.
   3) Equipment pads.

e. "Floated" Finish:
   1) All unformed surfaces unless otherwise specified.

f. "Steel Trowel" Finish:
   1) Tops of exposed walls.

3.4 CURING AND PROTECTION

A. General: Immediately after placement and finishing, protect concrete from premature drying, excessive hot or cold temperatures and mechanical injury. Perform curing by water curing, sheet form curing, or liquid membrane forming methods in accordance with ACI 308. Cure concrete continuously for a minimum of seven days at ambient temperatures above 40 degrees F.

B. Hot Weather Curing: See Hot Weather Concreting this Section.
C. Cold Weather Curing: See Cold Weather Concreting this Section.

D. Application of Liquid Membrane-Forming Curing Compound: Compound shall restrict the loss of water to not more than .039 g/cm² of surface in 72 hours when tested in accordance with ASTM C 156 at the coverage rate recommended by the manufacturer.
1. Submit letter from manufacturer stating coverage rate to meet this restriction in loss of water.
2. Finishing operations must be completed prior to application. Apply compound as soon as the free water on the surface disappears and no water sheen is visible. Surface shall be capable of taking walking workmen without being marred. Apply compound in two (2) applications.
3. Do not apply curing compound to construction joint surfaces. Protect exposed reinforcement during application of curing compound. Water cure those areas not coated with compound.
4. Do not use liquid membrane-forming curing compound when the ambient air temperature during placement and for 24 hours after placement is or will fall below 35 degrees F.
5. Do not use liquid membrane-forming curing compounds on concrete surfaces which will receive later treatments, such as hardeners, special finishes, protective coating, dampproofing, waterproofing, future grout, grout fill, or coatings.

E. Finished surfaces and slabs shall be protected from the direct rays of the sun to prevent checking and crazing.

3.5 FIELD QUALITY CONTROL TESTING

A. Perform the following field tests:
1. Determine slump of the concrete sample for each truckload upon arrival at site and whenever consistency of concrete appears to vary. Test according to ASTM C 143.
2. Determine temperature of concrete sample for each truckload.

3.6 FIELD QUALITY ASSURANCE TESTING

A. General
1. During the entire period when concrete is being placed, testing services shall be provided.
2. Failure to detect defective work will not prevent later rejection when defect is discovered nor shall it obligate the Engineer and Owner for final acceptance.
3. Routine testing of materials shall be the duty of the Quality Assurance Agency engaged by the Owner and will be performed without expense to Contractor.
4. Additional testing of materials because of changes in materials or proportions requested by Contractor and testing required by failure of material to meet specifications shall be at Contractor’s expense.
5. Agency performing testing services shall meet the requirements of ASTM C 1077.

B. Testing Services by Quality Assurance Agency
1. Test check the Contractor’s proposed materials for compliance with the specifications.
2. Review and check test the contractor’s proposed mix design.
3. Secure production samples of materials at plants or stockpiles during the course of the work and test for compliance with the specifications.
4. Conduct strength tests of the concrete in accordance with the following procedures:
   a. The responsible contractor shall secure composite samples in accordance with ASTM C 172. Each strength test shall be obtained from a different batch of concrete on a representative, truly random basis, avoiding any selection of the test batch other than by a number selected at random before commencement of concrete placement. When pumping or pneumatic equipment is used, samples...
shall be taken at the truck and discharge end. Concrete test cylinders shall be made by the responsible contractor under observation of the Quality Assurance Agency. The cylinders shall be molded, and twenty-four (24) hour initial curing provided, in strict compliance with ASTM C 31. Immediately thereafter a responsible representative of the Quality Assurance Agency shall pack them in a sturdy container, furnished by the responsible contractor, and as approved by the Quality Assurance Agency, surround them with wet sand or sawdust, protect them from freezing and transport them to the laboratory where they shall be cured in strict compliance with ASTM C31 until time of test. The cylinders shall be sequentially numbered and a record of date made and date transported to the laboratory. A copy of this record shall be forwarded to the Construction Manager. Unless this record reflects any exceptions, it will be assumed that these procedures have been followed to the mutual satisfaction of the contractor, the testing laboratory, and the Construction Manager. Above-mentioned record shall also include results of slump tests and temperature for each sample.

b. Specimens shall be tested in accordance with ASTM C 39. Two specimens shall be tested at 28 days for acceptance and two shall be tested at 7 days for information. The acceptance test results shall be the average of the strengths of the two specimens tested at 28 days. If one specimen in a test manifests evidence of improper sampling, molding, or testing, it shall be discarded and the strength of the remaining cylinder shall be considered the test result. Should both specimens in a test show any of the above defects, the entire test shall be discarded.

c. Samples for strength tests of each class of concrete (each concrete mix design) shall be taken not less than once a day or less than once for each 100 cu. yd. of concrete or for each 3000 sq. ft. of surface area placed. Not less than five (5) strength tests (4 cylinders per test) shall be conducted for each concrete mix design.

5. The air content of concrete shall be determined on a regular and frequent basis in accordance with ASTM C 231, ASTM C 173, or ASTM C 138.

C. Responsibilities and Duties of Contractor:
1. To facilitate testing services, the Contractor shall:
   a. Advise the Quality Assurance Agency sufficiently in advance of operations to allow for completion of quality tests and for the assignment of personnel.
   b. Provide and maintain for the sole use of the Quality Assurance Agency adequate facilities for safe storage and proper curing of concrete test cylinders on the project site.
   c. Provide containers for transporting concrete test cylinders to the testing laboratory. The containers shall be constructed in accordance with the laboratory’s instructions and shall be the property of the Contractor.

3.7 EVALUATION OF CONCRETE STRENGTH

A. Evaluation of Test Results:
1. Test results for standard molded and standard cured test cylinders shall be evaluated separately for each specified concrete mix design.
2. For evaluation of potential strength and uniformity, each specified mix design shall be represented by at least five tests.

B. Satisfactory Strength Level of Concrete: The strength level of the concrete will be considered satisfactory so long as the average of all sets of three consecutive strength test results equal or exceed the specified strength f’c and no individual strength test result falls below the specified strength f’c by more than 500 psi.

C. Testing of Concrete in Place:
1. Testing by impact hammer, sonoscope, or other nondestructive device may be permitted by the Engineer to determine relative strengths at various locations in the structure as an aid in revaluating concrete strength in place or for selecting areas to be cored. Such tests shall not be used as a basis for acceptance or rejections.

2. Core Tests:
   a. Where required, cores at least 2-inches in diameter shall be obtained and tested in accordance with ASTM C 42. If the concrete in the structure will be dry under service conditions, the cores shall be air dried (temperature 60 to 80 degrees F, relative humidity less than 60 percent) for 7 days before test and shall be tested dry. If the concrete in the structure will be more than superficially wet under service conditions, the cores shall be tested after moisture conditioning in accordance with ASTM C 42.
   b. At least three representative cores shall be taken from each member or area of concrete in place that is considered potentially deficient. The location of cores shall be determined by the Engineer so as to least impair the strength of the structure. If, before testing, one or more of the cores shows evidence of having been damaged subsequent to or during removal from the structure, it shall be replaced.
   c. Concrete in the area represented by a core test will be considered adequate if the average strength of the cores is equal to at least 85 percent of, and if no single core is less than 75 percent of, the specified strength f’c.
   d. Core holes shall be filled solid with low slump concrete.

3.8 ACCEPTANCE OF STRUCTURE

A. General
   1. Completed concrete work which meets all applicable requirements will be accepted without qualification.
   2. Completed concrete work which fails to meet one or more requirements but which has been repaired to being it into compliance will be accepted without qualification.
   3. Completed concrete work which fails to meet one or more requirements and which cannot be brought into compliance may be accepted or rejected as provided in these specifications.

B. Concrete Compressive Strength: If the concrete fails to meet the compressive strength requirements additional curing as specified by the Engineer may be required and modifications including change in the concrete mix design may be required for the remaining concrete work, all at the expense of the Contractor.

C. Dimensional Tolerances:
   1. Formed surfaces resulting in concrete outlines smaller than amount exceeding the requirements permitted by the tolerances of ACI 117 shall be considered deficient in strength and subject to the provisions of Paragraph 3.8E.
   2. Formed surfaces resulting in concrete outlined larger than required, by an amount exceeding the requirements of ACI 117 may be rejected and the excess material shall be subject to removal. If removal of the excess material is permitted, it shall be accomplished in such a manner as to maintain the strength of the section and to meet all other applicable requirements of function and appearance.
   3. Concrete members cast in the wrong location may be rejected if the strength, appearance, or function of the structure is adversely affected or the misplaced items interfere with other construction.
   4. Inaccurately formed concrete surfaces exceeding the requirements of ACI 117 and which are exposed to view may be rejected. Section shall be repaired or removed and replaced if required.
   5. Finished flatwork exceeding the allowable tolerances may be repaired provided that strength or appearance is not adversely affected. High spots may be removed with a...
terrazzo grinder, low spots filled in with an approved patching compound, or other remedial measure performed as permitted.

D. Appearances:
1. Concrete exposed to view with defects which adversely affect the appearance of the specified finish may be repaired, if possible. If, in the opinion of the Engineer, the defect cannot be repaired, the concrete may be accepted or rejected as provided in these specifications.
2. Concrete not exposed to view is not subject to rejection for defective appearance.

E. Strength of Structure – Potential Deficiency:
1. The strength of the structure in place will be considered potentially deficient if it fails to comply with any requirements, which control the strength of the structure, including but not necessarily limited to the following conditions:
   a. Low concrete strength.
   b. Reinforcing steel size, quantity, strength, position, or arrangement at variance, which the requirements of the contract documents.
   c. Concrete, which differs from the required dimensions or location in such a manner as to reduce the strength.
   d. Curing less than that specified.
   e. Inadequate protection of concrete from extremes of temperature during early stages of hardening and strength development.
   f. Mechanical injury, construction fires, accidents or premature removal of formwork likely to result in deficient strength.
   g. Poor workmanship likely to result in deficient strength.
2. Structural analysis and/or additional testing may be required when the strength of the structure is considered potentially deficient.
3. Core tests may be required when the strength of the concrete in place is considered potentially deficient.

F. Failure to Meet Requirements:
1. Owner and the Engineer reserve the right to reject any or all items which do not meet the requirements of the plans and specifications. The Contractor will replace these items veering all expenses in connection with such replacements.
2. If strength tests of concrete fail to meet the minimum requirements as specified herein, the concrete represented by such tests shall be considered questionable and shall be subject to further testing at the expense of the Contractor.
3. Additional tests of questionable concrete shall be conducted in accordance with ASTM C 42 as deemed necessary by the Owner and/or the Engineer.
4. Additional tests of the hardened concrete may be required by the Owner and/or the Engineer, if in their opinion, there is cause for concern over the adequacy of the structure regardless of the results of any previous tests. If initial tests requirements had been met, the Contractor shall not be required to bear the costs of such additional tests unless their results confirm the concrete in place is deficient.
5. If core tests fail to demonstrate strengths adequate for the intended purpose of the member or members in question or are inconclusive or impractical to obtain or if structural analysis does not confirm the safety of the structure, load tests may be required. The results shall be evaluated in accordance with ACI 318.
6. Concrete work judged inadequate by the Engineer and/or Construction Manager based on structural analysis or by results of a load test shall be reinforced with additional construction if so directed by the Engineer or shall be replaced, at the Contractor’s expense.
7. Except as provided earlier in this Paragraph, the Contractor shall pay all costs incurred in providing the additional testing and/or analysis required by this section.
3.9 REPAIR OF DEFECTIVE CONCRETE

A. The Engineer will determine the extent and manner of action to be taken for the correction of defective concrete as may be revealed by surface defects or otherwise.
   1. Prior to repair of defects, Contractor shall submit proposed material and repair methods to the Engineer for approval.
   2. Obtain approval from the Engineer before performing repair work other than the removal of imperfect texture, filling pin holes and insert holes.

B. As soon as the forms have been stripped and the concrete surfaces exposed, remove fins and other projections, fill recesses left by the removal of form ties, and repair surface defects which do not impair structural strength. Clean all exposed concrete surfaces and adjoining word stained by leakage of concrete to the satisfaction of the Construction Manager.

C. Hammer jack tie holes and other small cavities with a stiff mortar of the same material, but somewhat leaner that that in the concrete. Clean the cavity and the area wetted before mortar is placed.

D. Repair and patch defective areas with cement mortar of mix proportions and materials identical to those used in the surrounding concrete. Produce a finish on the patch that is indistinguishable from the surrounding concrete.

E. Where the honeycomb or voids are not excessive and repairs are authorized by the Engineer, outline removal area in a square shape with a ½- to ¾-inch deep saw cut and chip remaining at depth to sound solid concrete with a depth not less than 2-inches. When chipping is necessary, make edges perpendicular to concrete surface, or slightly undercut to provide a key at the edge of the patch. Before placing cement mortar, thoroughly clean, dampen, and brush coat area to be patched with neat cement grout. Other patching materials may be used if accepted by Engineer in writing prior to start of repair work. The patch should be kept damp for seven days at a temperature above 50 degrees.

SECTION 03 60 00 - GROUTING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. This Section specifies the grouts for the individual grouting requirements stated in other Sections of the Specifications and where indicated on the Drawings.

1.2 RELATED SECTIONS

A. Section 03 30 53: Miscellaneous Cast-in-Place Concrete.

1.3 REFERENCES

A. American Concrete Institute (ACI):
   1. ACI 305R, Hot Weather Concreting.
   2. ACI 306R, Cold Weather Concreting.

B. American Society for Testing and Materials (ASTM):
   1. ASTM C 33; Standard Specification for Concrete Aggregate.
   2. ASTM C 109; Test Method for Compressive Strength of Hydraulic Cement Mortars (Using two-inch or 50-mm Cube Specimens).
   5. ASTM C 596; Test Method for Drying Shrinkage of Mortar Containing Hydraulic Cement.
   7. ASTM C 1107; Specification for Packaged Dry, Hydraulic Cement Grout (Non-Shrink).

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's descriptive product data and current specifications covering named manufactured products specified in this Section. Include placing instructions.
   1. Non-Shrink Grout.

B. Design Mix: Prior to production of grout mix, submit for approval all mix designs proposed for project.

C. Test Report: Submit test reports specified within this specification.

1.5 QUALITY REQUIREMENTS

A. Grout Performance Qualifications: Furnish the grout manufacturer's current independent laboratory test results indicating the grout as non-shrink from time of placement as conforming to the Following:
   1. Early height change of 0.0% to 4.0%, according to ASTM C 827.
   2. Hardened height change of 0.0% to 0.3% according to ASTM C 1090.
   3. Indicating 4,000 psi strength developed with a trowelable mix within 24 hours.
   4. Indicating placement time based on initial set of not less than 60 minutes, according to ASTM C 191.
1.6 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Handling: Provide protective covering over materials to prevent moisture damage and contamination of grout materials during delivery and handling.

B. Storage: Store grout materials in undamaged condition with seals and labels intact as packaged by the manufacturer.

1.7 PROJECT CONDITIONS

A. Environmental Requirements: Protect against high and low temperatures and unfavorable environmental conditions in accordance with American Concrete Institute standards for placement of concrete.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Non-Shrink Non-Metallic Grout:
   1. A factory premixed material containing no corrosive irons, aluminums, chemicals, or gypsums.
      a. Provide a ready-mix type of grout requiring only the addition of water.
      b. Do not add other materials to the grout.
      c. For grout applications not in contact with sewage, provide grout manufactured using Type I (Normal) cement as specified in Section 03 30 53.
      d. For grout applications in contact with sewage, provide grout manufactured using Type II (Sulfate Resistant) cement as specified in Section 03 30 53.

2. Acceptable manufacturers for non-shrink non-metallic grout include the following:
   a. Five Star Products, Inc.
   b. US Grout, LLC.
   c. Or approved equal.

B. Portland Cement:
   1. Portland Cement conforming to the requirements of ASTM C 150 Type I or Type II as specified.
      a. Provide Type II (sulfate resistant) cement for applications in contact with sewage.

C. Aggregates:
   1. Fine aggregate conforming to the material quality requirements of ASTM C 33.

2.2 MIXES

A. Neat Cement:
   1. Use Type I Portland Cement and water in the same proportions specified in Section 03 30 53 for Class A cast-in-place concrete, but omit the fine and coarse aggregates from the mix.

B. Sand/Cement Grout:
   1. Proportion the proposed design mix using mixture of Portland Cement, fine aggregate, and water in the same proportion specified for Class A cast-in-place concrete in Section 03 30 53.
PART 3 - EXECUTION

3.1 PREPARATION

A. Preparation of Surface: Clean surfaces to be grouted to be free of oil, grease, laitance, dirt, and other contaminants. Remove loose material. Remove rust, paint, and oil from metal components in contact with grout.
   1. Additional Preparation: Perform additional surface preparation in accordance with manufacturer's instructions.

B. Formwork: Use forming procedures that allow proper and complete placement of grout.
   1. Pre-treat wood forms with forming oils so that they do not absorb moisture.
   2. Anchor support elements of formwork so no movement is possible. Remove supports only after grout has hardened.

C. Grout Mixing: Use power-operated mechanical mixer of sufficient capacity to carry out batch mixing without interruption.
   1. Mix Non-Shrink Grout in accordance with manufacturer's instructions.
   2. Mix Sand/Cement Grout in accordance with requirements specified for mixing Class A concrete in Section 03300.

3.2 INSTALLATION

A. Sand/Cement Grout:
   1. After the surface has been prepared as specified in Paragraph 3.1B, first saturate the surface to be grouted with water, remove any excess water, and then brush on a coat of Neat Cement.
      a. Place the grout while the Neat Cement is wet.
   2. Place the grout in a single pour, and consolidate and finish the grout with a steel trowel.
      a. In vertical applications, place grout in monolithic pours.
   3. Cure and seal the grout in accordance with ACI 308.

B. Non-Shrink Non-Metallic Grout:
   1. Place non-shrink non-metallic grout in exposed and unexposed areas at locations indicated on the Contract Drawings.
   2. Mix and place non-shrink non-metallic grout in accordance with the manufacturer’s published instructions.

3.3 FIELD QUALITY CONTROL

A. Remove formwork supports only after the grout has hardened.

B. Protect grout against high and low temperatures and unfavorable environmental conditions in accordance with the requirements of ACI 305R, ACI 306R, and ACI 306.1 for placement of concrete until it has cured.

END OF SECTION 03 60 00
SECTION 03 72 00 - REPAIR OF EXISTING CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: The work specified in this section consists of repairs to portions of the existing concrete. Types of repair to be made include but are not limited to:
   1. Repair of surface spalls and delaminations on existing concrete.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer’s descriptive product data and current specifications for materials proposed for the work of this section. Provide a certification stating the repair materials meet the specified requirements.

B. Repair Sites: Submit sketches of repair sites indicating type of repair, location, and dimensions.

C. Repair Program: Submit written procedures for required concrete repair, including protection plan for surrounding structure and utilities.

D. Qualifications: Submit written certificate stating Contractor has minimum five years of experience in comparable concrete repair.

1.3 QUALITY ASSURANCE

A. Concrete Repair Product Manufacturer Qualifications: The manufacturer of the specified product shall have in existence, for a minimum of 10 years, a program of training, certifying, and technically supporting a nationally organized Approved Contractor Program with annual re-certification of its participants.

B. Contractor Qualifications: Contractor shall have at least five years of experience in comparable concrete repair services. The Contractor shall also be an Approved Contractor of the manufacturer of the specified product, who has completed a program of instruction in the use of the specified material, and shall provide a notarized certification from the manufacturer attesting to their Approved Contractor status.
   1. Contractors shall provide the Engineer with two job references where they have successfully repaired existing concrete with the specified product.

C. Manufacturer’s Representative Services: The Contractor shall arrange for, and provide, the services of the product manufacturer’s technical representative to be on-site during the start up repair operation.
   1. Services shall include detailed instructions to the Contractor’s personnel on the use of the concrete repair material.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Handling: Deliver the specified product in original, unopened containers with the manufacturer’s name, labels, product identification, and batch numbers.

B. Storage: Store the specified product as recommended by the manufacturer.
1.5 PROJECT CONDITIONS

A. The Contractor, in conjunction with the Engineer, shall inspect the existing concrete surfaces and determine the location, limits, and type of repair required. The Contractor shall then develop and submit sketches of repair sites called for in 1.03, B. above. Repairs of deteriorated concrete specified by quantities listed on the Contract Drawings shall be performed by the Contractor and any cost incurred due to deviation from the quantity shall be negotiated at the supplemental unit price. Repair of concrete required due to demolition of adjacent concrete or embedments shall be included in the Contract Bid price and shall be performed at no additional cost to the Owner. The Contractor shall not perform any repair work without prior approval of the Engineer.

B. Reinforcement may be encountered within the repair region.

C. When using abrasive blasting equipment, shield all work for the protection of those portions of the facility which are still in operation.

D. Precautions shall be taken to protect surrounding items from damage related to concrete restoration work.

E. Maintain environmental conditions (such as temperature and ventilation) within limits recommended by manufacturer.

PART 2 - PRODUCTS

2.1 CEMENTITIOUS POLYMER MORTARS

A. Polymer Repair Mortar:
   1. Repair of Horizontal Surfaces:
      a. Polymer-modified cementitious, 2-component, trowel-grade patching mortar such as SikaTop 122 Plus as manufactured by Sika Corporation.
   2. Repair of Vertical and Overhead Surfaces:
      a. Polymer-modified, cementitious, 2-component, fast-setting mortar such as SikaTop 123 Plus, Gel Mortar, as manufactured by Sika Corporation.

B. Anti-Corrosion Coating:
   1. Epoxy-modified cementitious product formulated as a bonding agent and anti-corrosion coating such as Sika Armatec 110 EpoCem as manufactured by Sika Corporation.

2.2 MATERIAL SUBSTITUTIONS

A. The use of other than the specified products will be considered providing the contractor requests their use in writing to the Engineer. This request shall also be accompanied by (a) a certificate of compliance from an approved independent testing laboratory the proposed substitute products meet or exceed the specified performance criteria, tested in accordance with the specified test standards; and (b) documented proof the proposed substitute products have a five year proven record of performance, confirmed by actual field tests and five successful installations that the Engineer can investigate.
PART 3 - EXECUTION

3.1 INSPECTION

A. In the presence of the Engineer, inspect concrete surfaces under work of this section to determine the exact limits and location of the areas to be repaired.

3.2 SURFACE PREPARATION

A. Make a one-inch deep sawcut around the perimeter of repair area.

B. Remove spalled, scaled, loose, and deteriorated concrete. Use maximum 30# size pneumatic hammer or other approved method to remove deteriorated concrete resulting in substrate surface profile of ± 1/16 inch.

3.3 REINFORCEMENT CLEANING AND PROTECTION

A. Reinforcing steel with active corrosion shall be mechanically cleaned to remove all traces of rust and contaminants.

B. After cleaning of reinforcing steel, verify the amount of section lost of bar and contact Engineer if lost is more than 20% of original area. Engineer will provide details based on conditions reported.

C. Protect the reinforcing steel with the application of an anti-corrosion coating in accordance with manufacturer’s instructions.

3.4 APPLICATION

A. Maintain a clean condition substrate without dirt, dust, and other contaminants that may interfere with adhesion.

B. Follow manufacturer’s application instructions for substrate preparation, material placement, and material curing.

C. Place patching compound in a manner to assure all corners and gaps under reinforcing steel is completely filled and compacted.

3.5 CLEANING

A. Leave finished work in a clean condition without evidence of spillover onto adjacent areas.

END OF SECTION 03 72 00
SECTION 04 10 00 - MASONRY CLEANING  [C]

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:
   1. Removing plant growth.
   2. Cleaning of existing exterior brick masonry and stone trim.
      a. Stone trim shall be defined as all exterior stone including, but not limited to, limestone cornices, wall caps, free-standing columns, attached pilasters, sills keystones, veneer, watercourse trim, and attached site walls. [C]
      b. Cleaning is to be limited to the Henderson North Building, including the complete building exterior and all attached site walls. [C]

B. Related Sections:
   2. Division 04 Section “Unit Masonry” for new masonry work.

1.2 REFERENCES

A. Government Printing Office
   1. GPO Preservation Brief 1 - The Cleaning and Waterproof Coating of Masonry Buildings.

1.3 SUBMITTALS

A. Shop Drawings:
   1. Detail scaffolding installation and indicate points and types of attachment to existing structure required to support temporary facilities.

B. Product Data: Submit data on cleaning products.
   1. Provide additional record copies of final approved cleaning product data for PSU Office of Environmental Health and Safety for their review for hazardous materials.

C. Samples:
   1. Submit two containers of each cleaning product in manufacturer’s standard packaging.

D. Manufacturer’s Installation Instructions: Submit installation and application procedures for products selected for use. Include the following:
   1. Manufacturer’s standard installation instructions.
   2. Precautions for protecting adjacent materials.
   3. Procedures for containing waste materials resulting from restoration operations.
   4. Site cleanup instructions.

E. Manufacturer’s Certificates:
   1. Submit test reports and certifications substantiating that products comply with specified requirements.

F. Manufacturer and Contractor Qualification Data: Submit list of minimum five completed projects of similar size and cleaning procedures. Include the following:
   1. Project names and addresses. Include one project completed for minimum 10 years.
   2. Names, addresses, telephone number, and contact name for architects and owners.
   3. Description of restoration and cleaning products and methods used.
G. Masonry Cleaning Plan: Describe in detail the materials, methods, equipment, and sequence of operations to be used for cleaning work. Include the following:
   1. Procedures for protecting surrounding materials and Project site.
   2. Description of materials required that are not specified.

1.4 QUALITY ASSURANCE

A. Perform cleaning in accordance with GPO Preservation Brief 1.

B. Single Source: Obtain cleaning materials for masonry restoration from a single source for each type of material.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum ten years documented experience manufacturing products for restoration and cleaning historic masonry structures.

B. Masonry Cleaning Contractor: Company specializing in performing Work of this section with minimum ten years documented experience in cleaning masonry structures.

1.6 MOCKUP

A. Clean wall panel, minimum 20 sq ft each to determine extent of cleaning, cleaning methods, and cleaning products. Clean wall panels including each existing exterior veneer material or provide separate wall panels for brick and limestone. Repeat, using different cleaning methods, to produce minimum three different panels, until acceptable.
   1. Provide minimum one panel for each proposed detergent, chemical, and power washing cleaning method.
   2. When requested by Architect, provide additional mockup panels using different detergent or chemical products to improve cleaning effectiveness or reduce effect of cleaning on masonry surfaces.
   3. Architect will select mockup panel that produces most effective cleaning with least effect on brick, stone, and mortar joints representing cleaning methods to be used for remainder of building.

B. Locate mockup panels where directed by Architect.

C. Accepted mockups will become standard for work of this section.

1.7 PRE-INSTALLATION MEETING

A. Convene minimum one week prior to commencing Work of this section.

B. Review cleaning procedures including protection of surrounding materials and site.

C. Review sequence of Work and interface with work of other sections.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store cleaning materials in manufacturer's packaging.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Clean masonry only when:
1. Ambient air temperature is between 45 degrees F and 80 degrees F and is predicted to remain within this range for 7 days after performing cleaning work.
2. Wind cannot carry cleaning solutions to unprotected or previously cleaned areas.

1.10 SEQUENCING

B. Ensure masonry restoration is completed and accepted by Architect before beginning masonry cleaning operations.

C. Perform masonry cleaning work in the following sequence:
   1. Remove plant growth.
   2. Remove paint from masonry surfaces.
   3. Clean masonry surfaces.

PART 2 - PRODUCTS

2.1 CLEANING MATERIALS

B. Manufacturers:
   1. Diedrich Technologies, Inc.
   2. Dominion Restoration, Inc.
   3. Hydrochemical Techniques, Inc.
   4. ProSoCo, Inc.

C. Nonacidic Gel Cleaner: Gel containing detergents and chelating agents formulated for cleaning masonry surfaces; pH between 6 and 9.
   1. Sure Klean 942 Masonry Cleaner; ProSoCo, Inc.

D. Nonacidic liquid Cleaner: liquid cleaner formulated for removing mold, mildew, and other organic soilings from stone and brick.
   1. Bio-Cleanse; Dominion Restoration, Inc.

E. Alkaline Prewash Cleaner: Cleaner for prewash applications used only where followed by an acidic cleaner of type indicated for afterwash.
   1. Sure Klean 766 Prewash; ProSoCo, Inc.

F. Mild Acidic Cleaner: Cleaner containing no hydrochloric, hydrofluoric, or sulfuric acid; chlorine bleaches; or caustic soda.
   1. DR--60 Stone and Masonry Cleaner; Dominion Restoration, Inc.
   2. Sure Klean Light-Duly Restoration Cleaner; ProSoCo, Inc.

G. Acidic Cleaner: Masonry restoration cleaner composed of hydrofluoric acid blended with other acids and wetting agents.
   1. Diedrich 101G Granite, Tema Cotta, and Brick Cleaner; Diedrich Technologies, Inc.
   2. Hydroclean Brick, Granite, Sandstone and Tema Cotta Cleaner (HT-626); Hydrochemical Techniques, Inc.
   3. Sure Klean Heavy-Duly Restoration Cleaner; ProSoCo, Inc.
   4. Sure Klean 1028 Restoration Cleaner; ProSoCo, Inc.
   5. Sure Klean Restoration Cleaner; ProSoCo, Inc.

H. One-Part limestone Cleaner: One-part acidic formulation for cleaning limestone
   1. Hydroclean Limestone and Marble Cleaner and Brightener (HT -907); Hydrochemical Techniques, Inc.
   2. Sure Klean Limestone Restorer; ProSoCo, Inc.
I. Two-Part Limestone Gleaner: Two part system consisting of an alkaline cleaner for prewash and an acid neutralizer for afterwash
   1. Diedrich Limestone Cleaner Prerinse (707) and Neutralizer After-Rinse (707N); Diedrich Technologies, Inc.
   2. Hydroclean Limestone and Marble Precleaner (HT-704) and Hydroclean Limestone and Marble Cleaner and Brightener (HT-907); Hydrochemical Techniques, Inc.
   3. Sure Klean Limestone Prewash and Afterwash; ProSoCo, Inc.

J. Alkaline Paint Remover: Paste formulation for removing paint coatings from masonry.
   1. Diedrich 4041606/606X Paint Remover; Diedrich Technologies, Inc.
   2. Hydroclean Heavy Duty Paint Remover (HT-716); Hydrochemical Techniques, Inc.
   3. Enviro Strip #1; ProSoCo, Inc.
   4. Enviro Strip #2; ProSoCo, Inc.
   5. 1217 Poultice/Paint Stripper; ProSoCo, Inc.
   6. Sure Klean Heavy-Duty Paint Stripper; ProSoCo, Inc.

K. Solvent-Type Paint Remover: Thixotropic, water-rinsable solvent formulation for removing paint coatings from masonry.
   1. Diedrich 505 Special Coatings Stripper; Diedrich Technologies, Inc.
   2. Diedrich 505X Dry Strip; Diedrich Technologies, Inc.
   3. Dominion Multi-Layer Paint & Graffiti Remover; Dominion Restoration, Inc.
   4. Hydroclean Solvent Paint Remover (HT-300); Hydrochemical Techniques, Inc.
   5. Non-Methylene Chloride Paint Stripper; ProSoCo, Inc.
   6. Sure Klean 509 Paint Stripper; ProSoCo, Inc.
   7. Sure Klean 859 Paint Stripper; ProSoCo, Inc.
   8. Sure Klean 940 Paint Stripper; ProSoCo, Inc.

L. Water for Cleaning: Potable.

2.2 CHEMICAL CLEANING SOLUTIONS

A. Dilute chemical cleaners with water to produce solutions of concentration recommended by chemical cleaner manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify surfaces to be cleaned are ready for work of this section.

B. Verify mortar joints have been repointed as required to produce tight, compact joint surface.

C. Verify sealant joints have been repaired or replaced as required to produce joints fully adhered to joint substrates and without gaps or voids in joint surface.

3.2 PREPARATION

A. Protect elements surrounding work of this section from damage or disfiguration.

B. Protect people, motor vehicles, surrounding surfaces of building being cleaned, site, plants, and surrounding buildings from damage resulting from cleaning work.
   1. Prevent cleaning solutions from coming into contact with pedestrians, motor vehicles, landscaping, buildings, and other surfaces that could be damaged.
2. Erect temporary protection covers over pedestrian walkways remaining open and at points of entrance and exit for persons and vehicles that must remain in operation during course of masonry cleaning work

C. Carefully remove and store fixtures, fittings, finishing hardware, accessories that may be damaged by cleaning operations.

D. Provide facilities to collect, neutralize and dispose of cleaning operation wastes.

3.3 CLEANING MASONRY, GENERAL

A. Clean masonry from top to bottom from one end of each elevation to opposite end.

B. Use only Cleaning methods for each masonry material and location identical to methods used for approved mockup.
   1. Use natural-fiber brushes only.
   2. Use spray equipment that provides controlled volume and pressure at spray tip. Adjust pressure and volume to ensure that cleaning methods do not damage masonry.
   3. Apply chemical cleaner with low-pressure spray, equipped with a cone-shaped spray tip.
   4. For water spray application, use a fan-shaped spray tip that disperses water at an angle of 25 to 50 degrees.

C. Perform each cleaning method indicated in a manner that results in uniform coverage of all surfaces, including corners, moldings, and interstices, and that produces an even effect without streaking or damaging masonry surfaces.

D. Completely remove plant, moss, and shrub growth from masonry surfaces. Carefully remove plants, creepers, and vegetation by cutting at roots and allowing to dry as long as possible before removal.
   1. Apply root-killing material to plant roots according to manufacturers written instructions. Do not apply materials to plants that are to remain.

E. Rinse off chemical residue and soil by working upward from bottom to top of each treated area at each stage or scaffold setting.
   1. Apply rinse water in quantities to keep masonry surfaces wet below point of rinsing and to ensure residue is removed from entire masonry surface.

3.4 CLEANING EXISTING MASONRY

A. Clean existing masonry by one or more of the following methods, listed from least to most aggressive, as indicated in approved cleaning plan. Select least aggressive cleaning method available to effectively clean each type of masonry for existing conditions. Demonstrate effectiveness of selected cleaning methods with mockup. Adjust cleaning plan and selected cleaning methods based on mockup cleaning. Use application pressures determined during mockup cleaning.
   1. Cold-water wash.
   2. Warm-Water Wash.
   3. Detergent Cleaning.
   4. Nonacidic Liquid Chemical Cleaning.
   5. Nonacidic Gel Chemical Cleaning.
   7. Acidic Chemical Cleaning.

B. Remove paint from existing masonry by one or more of the following methods, listed from least to most aggressive, as indicated in approved cleaning plan. Select least aggressive cleaning
method available to effectively remove existing paint from each type of masonry. Demonstrate effectiveness of selected cleaning methods with mockup. Adjust cleaning plan and selected cleaning methods based on mockup cleaning.

1. Alkaline Paint Remover.
2. Solvent-Type Paint Remover.

C. Apply cleaning solutions and paint removers in accordance with manufacturer's instructions and approved cleaning plan.

D. Clean surfaces and remove large particles with wood scrapers or non-ferrous wire brush.

E. Spray or brush coat masonry with cleaning solution.

F. Provide second application when required by approved mockup.

G. Allow sufficient time for solution to remain on masonry and agitate with soft fiber brush.

H. Rinse from bottom up with potable water applied at 400 to 600 psi and at rate of 4 to 6 gal/min.

I. Allow masonry to dry.

J. Request inspection of cleaned masonry by Architect.

K. Repeat cleaning operations and adjust cleaning plan when required by Architect to match approved mockup.

3.5 WATER REPELLENT TREATMENT

A. Water Repellent Treatment At the completion of the cleaning operations, apply a water repellent treatment using a non-staining water repellent, gum resin based solution.

1. Silicone or silicone based materials will not be acceptable.
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Concrete masonry units.
2. Face brick.
3. Decorative CMU veneer.
4. Mortar and grout.
5. Steel reinforcing bars.
7. Ties and anchors.
8. Concealed lintel system for brick veneer.
9. Embedded flashing.
10. Miscellaneous masonry accessories.
11. Cavity-wall insulation.
12. Through-wall flashing for stone masonry is included in this section, but shall also comply with the requirements of Division 7 section “Flashing and Sheet Metal.”

B. Related Sections:

1. Division 02 Sections "Structure Demolition" and “Selective Structure Demolition” for salvage of existing face brick to be reused.
2. Division 03 Section "Cast-in-Place Concrete" for installing dovetail slots for masonry anchors.
3. Division 05 Section "Structural Steel Framing" for installing anchor sections of adjustable masonry anchors for connecting to structural steel frame.
4. Division 05 Section "Metal Fabrications" for furnishing steel lintels and shelf angles for unit masonry.
5. Division 07 Section "Sheet Metal Flashing and Trim" for furnishing manufactured reglets installed in masonry joints.
6. Division 32 Section "Unit Paving" for exterior unit masonry paving.

1.3 DEFINITIONS

A. CMU(s): Concrete masonry unit(s).
B. Reinforced Masonry: Masonry containing reinforcing steel in grouted cells.

1.4 PERFORMANCE REQUIREMENTS

A. All concrete work shall conform to ACI 530/ASCE 5 “Building Code Requirements for Masonry Structures” except as noted otherwise.
B. Provide structural unit masonry that develops indicated net-area compressive strengths at 28 days.

   1. Determine net-area compressive strength of masonry from average net-area compressive strengths of masonry units and mortar types (unit-strength method) according to Tables 1 and 2 in ACI 530.1/ASCE 6/TMS 602.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. LEED Submittals:

   1. Product Certificates for Credit MR 5.1 and Credit MR 5.2: For products and materials required to comply with requirements for regional materials indicating location and distance from Project of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating cost for each regional material and the fraction by weight that is considered regional.

C. Shop Drawings: For the following:

   1. Masonry Units: Show sizes, profiles, coursing, and locations of special shapes.
   2. Reinforcing Steel: Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement." Show elevations of reinforced walls.
   4. Fabricated Flashing: Detail corner units, end-dam units, and other special applications.

D. Samples for Initial Selection:

   1. Face brick, in the form of straps of five or more bricks.
   2. Colored mortar.
   3. Weep holes/vents.

E. Samples for Verification: For each type and color of the following:

   1. Exposed CMUs.
   2. Face brick, in the form of straps of five or more bricks.
   3. Special brick shapes.
   4. Pigmented and colored-aggregate mortar. Make Samples using same sand and mortar ingredients to be used on Project.
   5. Weep holes and vents.
   6. Accessories embedded in masonry.

F. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers, source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates.

   1. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Architect and approved in writing.

G. Qualification Data: For testing agency.

H. Material Certificates: For each type and size of the following:

   1. Masonry units.
a. Include material test reports substantiating compliance with requirements.
b. For brick, include size-variation data verifying that actual range of sizes falls within specified tolerances.
c. For exposed brick, include test report for efflorescence according to ASTM C 67.
d. For surface-coated brick, include test report for durability of surface appearance after 50 cycles of freezing and thawing per ASTM C 67.
e. For masonry units used in structural masonry, include data and calculations establishing average net-area compressive strength of units.

2. Cementitious materials. Include brand, type, and name of manufacturer.
3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.
4. Grout mixes. Include description of type and proportions of ingredients.
5. Reinforcing bars.
7. Anchors, ties, and metal accessories.
8. Concealed lintel system.

I. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.
1. Include test reports for mortar mixes required to comply with property specification. Test according to ASTM C 109/C 109M for compressive strength, ASTM C 1506 for water retention, and ASTM C 91 for air content.
2. Include test reports, according to ASTM C 1019, for grout mixes required to comply with compressive strength requirement.

J. Statement of Compressive Strength of Masonry: For each combination of masonry unit type and mortar type, provide statement of average net-area compressive strength of masonry units, mortar type, and resulting net-area compressive strength of masonry determined according to Tables 1 and 2 in ACI 530.1/ASCE 6/TMS 602.

K. Cold-Weather and Hot-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with requirements.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM C 1093 for testing indicated.

B. Concealed Lintel System:
1. Material shall be provided by a manufacturer with at least five years experience in the manufacture of concealed lintel systems.
2. Manufacturer shall demonstrate experience in projects of similar scope.
3. Product must be manufactured in accordance with an established quality assurance program.
4. Product capacity or performance shall be verified by relevant test data or calculation.

C. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from single source from single manufacturer for each product required.

D. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

E. Masonry Standard: Comply with ACI 530.1/ASCE 6/TMS 602 unless modified by requirements in the Contract Documents.
F. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockup of typical wall area as shown on Drawings.

2. Where masonry is to match existing, erect mockups adjacent and parallel to existing surface.

3. Clean one-half of exposed faces of mockups with masonry cleaner as indicated.

4. Protect accepted mockups from the elements with weather-resistant membrane.

5. Approval of mockups is for color, texture, and blending of masonry units; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship.

   a. Approval of mockups is also for other material and construction qualities specifically approved by Architect in writing.
   
   b. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless such deviations are specifically approved by Architect in writing.

6. Protect and maintain mockup as a reference until the conclusion of construction.

G. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section "Project Management and Coordination."

H. Coordination Meeting for Stone Anchorage Systems: Prior to submission of shop drawings and other required submittals for the stone veneer, stone anchorage systems, structural steel, miscellaneous steel and cold-formed metal framing, the General Trades Contractor shall hold a coordination meeting with the steel supplier, cold-formed metal framing supplier, stone supplier, stone installer, stone anchorage system engineer retained by the stone supplier and/or installer, cold-formed metal framing engineer, masonry subcontractor, Construction Manager and Architect to review and coordinate the anchorage systems for the interior and exterior stone. The initial meeting shall cover the following:

   1. Responsibilities and extent of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   
   2. Coordination of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   
   3. Review schedule of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   
   4. Impact of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems on work by other contractors, subcontractors, installers and suppliers.
   
   5. Determine date(s) for follow-up meetings, if required, to complete coordination of the work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.

B. Deliver concealed lintel system to job site in original factory packaging to ensure proper handling in transit.

C. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

D. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
E. Deliver preblended, dry mortar mix in moisture-resistant containers designed for use with dispensing silos. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in covered weatherproof dispensing silos.

F. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.8 PROJECT CONDITIONS

A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.
   1. Extend cover a minimum of 24 inches down both sides of walls and hold cover securely in place.
   2. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 24 inches down face next to unconstructed wythe and hold cover in place.

B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least three days after building masonry walls or columns.

C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.
   1. Protect base of walls from rain-splashed mud and from mortar splatter by spreading coverings on ground and over wall surface.
   2. Protect sills, ledges, and projections from mortar droppings.
   3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.
   4. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.

D. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
   1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and higher and will remain so until masonry has dried, but not less than seven days after completing cleaning.

PART 2 - PRODUCTS

2.1 MASONRY UNITS, GENERAL

A. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to contain chips, cracks, or other defects exceeding limits stated in the standard. Do not use units where such defects will be exposed in the completed Work.
B. Fire-Resistance Ratings: Where indicated, provide units that comply with requirements for fire-resistance ratings indicated as determined by testing according to ASTM E 119, by equivalent masonry thickness, or by other means, as acceptable to authorities having jurisdiction.

2.2 CONCRETE MASONRY UNITS

A. Regional Materials: Provide CMUs that have been manufactured within 500 miles of Project site from aggregates and cement that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.

B. Shapes: Provide shapes indicated and as follows, with exposed surfaces matching exposed faces of adjacent units unless otherwise indicated.

1. Provide special shapes for lintels, corners, jambs, sashes, movement joints, headers, bonding, and other special conditions.
2. Provide square-edged units for outside corners unless otherwise indicated.

C. CMUs: ASTM C 90 Normal Weight or Lightweight Aggregate.

1. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 2500 psi for wall heights greater than 16'-6” and 2000 psi elsewhere unless noted otherwise.
2. Density Classification: Lightweight or Normal weight unless otherwise indicated.
3. Size (Width): Manufactured to dimensions 3/8 inch less than nominal dimensions.
4. Provide UL Classification D-2 units for fire rated concrete masonry walls.

D. Decorative CMU Veneer: ASTM C 90.

1. Basis of Design Product: Subject to compliance with requirements, provide Decro Face Veneer as manufactured by Masonry Processes, Inc., and distributed by Barnes&Cone, Syracuse, NY 315.437.0305, or approved equal.
2. Thickness: 4” nominal.
3. Size: 16” x 24”.
4. Pattern and Texture:
   a. Match Architect's samples.
5. Colors: Match Architect's samples.
7. It is the Architect's intent to have the color of this masonry match the limestone veneer on this project. This color selection will be confirmed during the submittal process to assure that it matches the limestone supplied for the project. [C]

2.3 CONCRETE AND MASONRY LINTELS

A. General: Provide one of the following:

B. Concrete Lintels: Precast or formed-in-place concrete lintels complying with requirements in Division 03 Section "Cast-in-Place Concrete," and with reinforcing bars indicated.

C. Masonry Lintels: Prefabricated or built-in-place masonry lintels made from bond beam CMUs with reinforcing bars placed as indicated and filled with coarse grout. Cure precast lintels before handling and installing. Temporarily support built-in-place lintels until cured.
2.4 CONCEALED LINTEL SYSTEM FOR BRICK VENEER

A. Basis of Design: Subject to requirements, provide 'Concealed Lintel System' and accessories as manufactured by HALFEN Anchoring Systems, Converse, TX, or approved equal.
   1. Concealed lintel system shall be comprised of fabricated spines and accessories.
   2. Lintel system components shall be fabricated from stainless steel to ASTM A666 type 304, annealed.

2.5 BRICK

A. Regional Materials: Provide brick that has been manufactured within 500 miles of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.

B. General: Provide shapes indicated and as follows, with exposed surfaces matching finish and color of exposed faces of adjacent units:

   1. For ends of sills and caps and for similar applications that would otherwise expose unfinished brick surfaces, provide units without cores or frogs and with exposed surfaces finished.
   2. Provide special shapes for applications where stretcher units cannot accommodate special conditions, including those at corners, movement joints, bond beams, sashes, and lintels.
   3. Provide special shapes for applications requiring brick of size, form, color, and texture on exposed surfaces that cannot be produced by sawing.
   4. Provide special shapes for applications where shapes produced by sawing would result in sawed surfaces being exposed to view.
   5. Provide special shapes as shown on Drawings.
   6. Provide cored bricks for internally reinforced lintels as detailed in Drawings.

C. Face Brick: Facing brick complying with ASTM C 216.

   1. Products: Subject to compliance with requirements, provide the following:
      a. Brandywine Handmade as manufactured by Glen-Gery Corporation (no substitutions permitted).
   2. Grade: SW.
   3. Type: FBA.
   4. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 4000 psi.
   5. Initial Rate of Absorption: May exceed 30 g/30 sq. in. per minute when tested per ASTM C 67.
      a. Bricks should be field tested to determine wetting requirements.
      b. Typically, Glen-Gery handmade brick should be wetted prior to laying.
   7. Application: Use where brick is exposed unless otherwise indicated.
   8. Where shown to "match existing," provide face brick matching color range, texture, and size of existing adjacent brickwork.

D. Salvaged Face Brick: To be cleaned and reinstalled as indicated on Drawings.

2.6 MORTAR AND GROUT MATERIALS

A. Regional Materials: Provide aggregate for mortar and grout, cement, and lime that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.
B. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.

C. Hydrated Lime: ASTM C 207, Type S.

D. Portland Cement-Lime Mix: Packaged blend of portland cement and hydrated lime containing no other ingredients.

E. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes and complying with ASTM C 979. Use only pigments with a record of satisfactory performance in masonry mortar.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Davis Colors; True Tone Mortar Colors.
   b. Lanxess Corporation; Bayferrox Iron Oxide Pigments.
   c. Solomon Colors, Inc.; SGS Mortar Colors.

2. Match mortar color of adjacent Henderson North building.
   a. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

F. Aggregate for Mortar: ASTM C 144.

1. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.
2. For joints less than 1/4 inch thick, use aggregate graded with 100 percent passing the No. 16 sieve.
3. Colored-Mortar Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color.
4. Match mortar color of adjacent Henderson North building.
   a. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

H. Cold-Weather Admixture: Nonchloride, noncorrosive, accelerating admixture complying with ASTM C 494/C 494M, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Euclid Chemical Company (The); Accelguard 80.
   c. Sonneborn Products, BASF Aktiengesellschaft; Trimix-NCA.

I. Water: Potable.
2.7 REINFORCEMENT

A. Uncoated Steel Reinforcing Bars: ASTM A 615/A 615M or ASTM A 996/A 996M, Grade 60.

B. Reinforcing that requires welding or field bending shall be ASTM A706 fy=60 ksi.

C. Masonry Joint Reinforcement, General: ASTM A 951/A 951M.

1. Interior Walls: Hot-dip galvanized, carbon steel.
2. Exterior Walls: Hot-dip galvanized, carbon steel.
5. Wire Size for Veneer Ties: 0.148-inch diameter.
6. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches o.c.
7. Provide in lengths of not less than 10 feet, with prefabricated corner and tee units.
8. Provide reinforcement @ min. 16” vertically, unless noted otherwise.

D. Masonry Joint Reinforcement for Single-Wythe Masonry: Either ladder or truss type with single pair of side rods.

E. Masonry Joint Reinforcement for Multiwythe Masonry:
   1. Adjustable (two-piece) type, either ladder or truss design, with one side rod at each face shell of backing wythe and with separate adjustable ties with pintle-and-eye connections having a maximum adjustment of 1-1/4 inches. Size ties to extend at least halfway through facing wythe but with at least 5/8-inch cover on outside face. Ties have hooks or clips to engage a continuous horizontal wire in the facing wythe.

F. Masonry Joint Reinforcement for Veneers Anchored with Seismic Masonry-Veneer Anchors: Single 0.187-inch- diameter, hot-dip galvanized, carbon-steel continuous wire.

2.8 TIES AND ANCHORS

A. Materials: Provide ties and anchors specified in this article that are made from materials that comply with the following unless otherwise indicated.

2. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Wire Ties, General: Unless otherwise indicated, size wire ties to extend at least halfway through veneer but with at least 5/8-inch cover on outside face. Outer ends of wires are bent 90 degrees and extend 2 inches parallel to face of veneer.

C. Adjustable Anchors for Connecting to Structural Steel Framing: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

1. Anchor Section for Welding to Steel Frame: Crimped 1/4-inch- diameter, hot-dip galvanized steel wire.
2. Tie Section: Triangular-shaped wire tie, sized to extend within 1 inch of masonry face, made from 0.187-inch- diameter, hot-dip galvanized steel wire.

D. Adjustable Anchors for Connecting to Concrete: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

1. Connector Section: Dovetail tabs for inserting into dovetail slots in concrete and attached to tie section; formed from 0.05-inch- thick, steel sheet, galvanized after fabrication in areas
where humidity does not exceed 75%; 0.109-inch- thick, stainless-steel sheet in areas where humidity exceeds 75%.

2. Tie Section: Triangular-shaped wire tie, sized to extend within 1 inch of masonry face, made from 0.187-inch- diameter, hot-dip galvanized steel wire.

E. Partition Top anchors: 0.105-inch- thick metal plate with 3/8-inch- diameter metal rod 6 inches long welded to plate and with closed-end plastic tube fitted over rod that allows rod to move in and out of tube. Fabricate from steel, hot-dip galvanized after fabrication.

F. Rigid Anchors: Fabricate from steel bars 1-1/2 inches wide by 1/4 inch thick by 24 inches long, with ends turned up 2 inches or with cross pins unless otherwise indicated.

1. Corrosion Protection: Hot-dip galvanized to comply with ASTM A 153/A 153M.

G. Adjustable Masonry-Veneer Anchors:

1. General: Provide anchors that allow vertical adjustment but resist tension and compression forces perpendicular to plane of wall, for attachment over sheathing to wood or metal studs, and as follows:

   a. Structural Performance Characteristics: Capable of withstanding a 100-lbf load in both tension and compression without deforming or developing play in excess of 0.05 inch.

2. Screw-Attached, Masonry-Veneer Anchors: Units consisting of a wire tie and a metal anchor section.

   a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

      1) Dayton Superior Corporation, Dur-O-Wal Division; D/A 210 with D/A 700-708.
      2) Heckmann Building Products Inc.; 315-D with 316.
      3) Hohmann & Barnard, Inc.; DW-10 or DW-10HS.
      4) Wire-Bond; 1004, Type III.

   b. Anchor Section: Sheet metal plate, 1-1/4 inches wide by 6 inches 9 inches long, with screw holes top and bottom and with raised rib-stiffened strap, 5/8 inch wide by 3-5/8 inches 5-1/2 inches long, stamped into center to provide a slot between strap and plate for inserting wire tie.

   c. Fabricate sheet metal anchor sections and other sheet metal parts from 0.109-inch-thick, stainless-steel sheet.

   d. Wire Ties: Triangular-, rectangular-, or T-shaped wire ties fabricated from 0.187-inch-diameter, hot-dip galvanized steel wire.

2.9 MISCELLANEOUS ANCHORS

A. Unit Type Inserts in Concrete: Cast-iron or malleable-iron wedge-type inserts.

B. Dovetail Slots in Concrete: Furnish dovetail slots with filler strips, of slot size indicated, fabricated from 0.034-inch, galvanized steel sheet.

C. Anchor Bolts: Headed steel bolts complying with ASTM A 307, Grade A; with ASTM A 563 hex nuts and, where indicated, flat washers; hot-dip galvanized to comply with ASTM A 153/A 153M, Class C; of dimensions indicated.

D. Postinstalled Anchors: Torque-controlled expansion anchors or chemical anchors.
1. Load Capacity: Capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

2. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5 unless otherwise indicated.

2.10 EMBEDDED FLASHING MATERIALS

A. Metal Flashing: Provide metal flashing complying with SMACNA's "Architectural Sheet Metal Manual" and Division 07 Section "Sheet Metal Flashing and Trim" and as follows:

1. Stainless Steel: ASTM A 240/A 240M, Type 304, 0.016 inch thick.
2. Fabricate continuous flashings in sections 96 inches long minimum, but not exceeding 12 feet. Provide splice plates at joints of formed, smooth metal flashing.
3. Fabricate through-wall metal flashing embedded in masonry from stainless steel, with ribs at 3-inch intervals along length of flashing to provide an integral mortar bond.
   a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      1) Cheney Flashing Company; Cheney Flashing (Dovetail) or Cheney 3-Way Flashing (Sawtooth).
4. Fabricate through-wall flashing with snaplock receiver on exterior face where indicated to receive counterflashing.
5. Fabricate metal drip edges for ribbed metal flashing from plain metal flashing of same metal as ribbed flashing and extending at least 3 inches into wall with hemmed inner edge to receive ribbed flashing and form a hooked seam. Form hem on upper surface of metal so that completed seam will shed water.
6. Metal Drip Edge: Fabricate from stainless steel. Extend at least 3 inches into wall, and terminate at face of wall as indicated on the Drawings.
7. Metal Sealant Stop: Fabricate from stainless steel. Extend at least 3 inches into wall and out to exterior face of wall. At exterior face of wall, bend metal back on itself for 3/4 inch and down into joint 1/4 inch to form a stop for retaining sealant backer rod.
8. Metal Expansion-Joint Strips: Fabricate from stainless steel to shapes indicated.

B. Application: Unless otherwise indicated, use the following:

1. Where flashing is indicated to receive counterflashing, use metal flashing.
2. Where flashing is indicated to be turned down at or beyond the wall face, use metal flashing.
3. Where flashing is partly exposed and is indicated to terminate at the wall face, use metal flashing.
4. Where flashing is fully concealed, use metal flashing.

C. Solder and Sealants for Sheet Metal Flashings:

1. Solder for Stainless Steel: ASTM B 32, Grade Sn60, with acid flux of type recommended by stainless-steel sheet manufacturer.
2. Elastomeric Sealant: ASTM C 920, elastomeric silicone polymer sealant; low modulus; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight. Comply with recommendations by sheet metal manufacturer and
fabricator of components being sealed and comply with requirements for joint sealants as specified in Division 7 Section “Joint Sealants.”

D. Adhesives, Primers, and Seam Tapes for Flashings: Flashing manufacturer’s standard products or products recommended by flashing manufacturer for bonding flashing sheets to each other and to substrates.

E. For any other flashings or sheet metal work associated with Unit Masonry, see Division 07 Section “Sheet Metal Flashing and Trim.”

2.11 MISCELLANEOUS MASONRY ACCESSORIES

A. Compressible Filler: Premolded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene.

B. Preformed Control-Joint Gaskets: Made from styrene-butadiene-rubber compound, complying with ASTM D 2000, Designation M2AA-805 and designed to fit standard sash block and to maintain lateral stability in masonry wall; size and configuration as indicated.

C. Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D 226, Type I (No. 15 asphalt felt).

D. Weep/Vent Products: Use the following unless otherwise indicated:

1. Wicking Material: Absorbent rope, made from cotton, 1/4 to 3/8 inch in diameter, in length required to produce 2-inch exposure on exterior and 18 inches in cavity. Use only for weeps.

E. Cavity Drainage Material: Free-draining mesh, made from polymer strands that will not degrade within the wall cavity.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

   a. Advanced Building Products Inc.; Mortar Break II.
   b. Archovations, Inc.; CavClear Masonry Mat.
   c. Dayton Superior Corporation, Dur-O-Wal Division; Polytite MortarStop.
   d. Mortar Net USA, Ltd.; Mortar Net.

2. Provide one of the following configurations:

   a. Strips, not less than 1-1/2 inches thick and 10 inches high, with dimpled surface designed to catch mortar droppings and prevent weep holes from clogging with mortar.

F. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells and hold reinforcing bars in center of cells. Units are formed from 0.148-inch steel wire, hot-dip galvanized after fabrication. Provide units designed for number of bars indicated.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

   a. Dayton Superior Corporation, Dur-O-Wal Division; D/A 810, D/A 812 or D/A 817.
   c. Hohmann & Barnard, Inc.; #RB or #RB-Twin Rebar Positioner.
   d. Wire-Bond; O-Ring or Double O-Ring Rebar Positioner.
2.12 CAVITY-WALL INSULATION

A. Extruded-Polystyrene Board Insulation with Increased R-Value:  ASTM C 578, Type IV, but with an aged thermal resistance (R-value) for 1-inch thickness of 5.6 deg F x h x sq. ft./Btu at 75 deg F at 5 years; closed-cell product with a carbon-black filler and extruded with an integral skin.

B. Adhesive:  Type recommended by insulation board manufacturer for application indicated.

2.13 MASONRY CLEANERS

A. Proprietary Acidic Cleaner:  Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

2.14 MORTAR AND GROUT MIXES

A. General:  Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

1. Do not use calcium chloride in mortar or grout.
2. Use portland cement-lime mortar unless otherwise indicated.
3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.

B. Preblended, Dry Mortar Mix:  Furnish dry mortar ingredients in form of a preblended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

C. Mortar for Unit Masonry:  Comply with ASTM C 270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry.

1. For masonry below grade or in contact with earth, use Type S.
2. For reinforced masonry, use Type S.
3. For exterior, above-grade, load-bearing and non-load-bearing walls and parapet walls; for interior load-bearing walls; for interior non-load-bearing partitions; and for other applications where another type is not indicated, use Type N.
4. For interior non-load-bearing partitions, Type O may be used instead of Type N.

D. Mortar Color Matching:  Mortar color and texture shall match adjacent Henderson North building. Color match should be achieved, first, through the use of colored aggregate, and second, through the use of pigmented mortar. Provide samples of a range of custom mixes to Architect and Owner for approval.

a. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

b. Review of the mortar color match will be part of the overall review of the mock-up panel required by this section. Final approval of mortar will not be issued until the mortar color on the mock-up panel is accepted by the Owner and Architect.

E. Pigmented Mortar:  Produce required mortar color by using natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes.
1. Mix to match brickwork on adjacent Henderson North building.
   a. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

2. Application: Use pigmented mortar for exposed mortar joints with the following units:
   a. Face brick.

F. Colored-Aggregate Mortar: Produce required mortar color by using colored aggregates and natural color or white cement as necessary to produce required mortar color.
   a. Mix to match mortar in brickwork on adjacent Henderson North building.
   b. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

G. Grout for Unit Masonry: Comply with ASTM C 476.
   1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 1.15.1 in ACI 530.1/ASCE 6/TMS 602 for dimensions of grout spaces and pour height.
   2. Provide grout with a slump of 8 to 11 inches as measured according to ASTM C 143/C 143M.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
   1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.
   2. Verify that foundations are within tolerances specified.
   3. Verify that reinforcing dowels are properly placed.

B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Thickness: Build cavity and composite walls and other masonry construction to full thickness shown. Build single-wythe walls to actual widths of masonry units, using units of widths indicated.

B. Build chases and recesses to accommodate items specified in this and other Sections.

C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match the construction immediately adjacent to opening.

D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.
E. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures.
   1. Mix units from several pallets or cubes as they are placed.

F. Matching Existing Masonry: Match coursing, bonding, color, and texture of existing masonry.
   1. Due to variations in the coloration of the brick and mortar on the existing Henderson North Building, the Owner and Architect will designate an area of the existing masonry to use in matching the mortar color.

G. Install salvaged existing face brick as shown on Drawings.

H. Wetting of Brick: Wet brick before laying if initial rate of absorption exceeds 30 g/30 sq. in. per minute when tested per ASTM C 67. Allow units to absorb water so they are damp but not wet at time of laying.

3.3 TOLERANCES

A. Dimensions and Locations of Elements:
   1. For dimensions in cross section or elevation do not vary by more than plus 1/2 inch or minus 1/4 inch.
   2. For location of elements in plan do not vary from that indicated by more than plus or minus 1/2 inch.
   3. For location of elements in elevation do not vary from that indicated by more than plus or minus 1/4 inch in a story height or 1/2 inch total.

B. Lines and Levels:
   1. For bed joints and top surfaces of bearing walls do not vary from level by more than 1/4 inch in 10 feet, or 1/2 inch maximum.
   2. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.
   3. For vertical lines and surfaces do not vary from plumb by more than 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch maximum.
   4. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.
   5. For lines and surfaces do not vary from straight by more than 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch maximum.
   6. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 feet, or 1/2 inch maximum.
   7. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch except due to warpage of masonry units within tolerances specified for warpage of units.

C. Joints:
   1. For bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch, with a maximum thickness limited to 1/2 inch.
   2. For exposed bed joints, do not vary from bed-joint thickness of adjacent courses by more than 1/8 inch.
   3. For head and collar joints, do not vary from thickness indicated by more than plus 3/8 inch or minus 1/4 inch.
4. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch. Do not vary from adjacent bed-joint and head-joint thicknesses by more than 1/8 inch.

5. For exposed bed joints and head joints of stacked bond, do not vary from a straight line by more than 1/16 inch from one masonry unit to the next.

3.4 LAYING MASONRY WALLS

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.

B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in Flemish bond; do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.

C. Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 4-inches. Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.

D. Stopping and Resuming Work: Stop work by racking back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.

E. Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.

F. Fill space between steel frames and masonry solidly with mortar unless otherwise indicated.

G. Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below and rod mortar or grout into core.

H. Fill cores in hollow CMUs with grout 24 inches above bearing plates, beams, lintels, posts, and similar items unless otherwise indicated.

I. Build non-load-bearing interior partitions full height of story to underside of solid floor or roof structure above unless otherwise indicated.

   1. Install compressible filler in joint between top of partition and underside of structure above.
   2. Fasten partition top anchors to structure above and build into top of partition. Grout cells of CMUs solidly around plastic tubes of anchors and push tubes down into grout to provide 1/2-inch clearance between end of anchor rod and end of tube. Space anchors 48 inches o.c. unless otherwise indicated.
   3. At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Division 07 Section "Fire-Resistive Joint Systems."

3.5 MORTAR BEDDING AND JOINTING

A. Lay hollow CMUs as follows:

   1. With face shells fully bedded in mortar and with head joints of depth equal to bed joints.
   2. With webs fully bedded in mortar in all courses of piers, columns, and pilasters.
   3. With webs fully bedded in mortar in grouted masonry, including starting course on footings.
   4. With entire units, including areas under cells, fully bedded in mortar at starting course on footings where cells are not grouted.
B. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.

C. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.

D. Cut joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint) unless otherwise indicated.

3.6 CAVITY WALLS

A. Bond wythes of cavity walls together as follows:
      a. Where one wythe is of clay masonry and the other of concrete masonry, use adjustable (two-piece) type reinforcement with continuous horizontal wire in facing wythe attached to ties to allow for differential movement regardless of whether bed joints align.

B. Keep cavities clean of mortar droppings and other materials during construction. Bevel beds away from cavity, to minimize mortar protrusions into cavity. Do not attempt to trowel or remove mortar fins protruding into cavity.

C. Strike joints of CMU backup wall flush and allow wall to cure before coating cavity face of backup wythe to comply with Division 07 Section “Fluid-Applied Membrane Air Barriers.”

D. Installing Cavity-Wall Insulation: Place small dabs of adhesive, spaced approximately 12 inches o.c. both ways, on inside face of insulation boards, or attach with plastic fasteners designed for this purpose. Fit courses of insulation between wall ties and other confining obstructions in cavity, with edges butted tightly both ways. Press units firmly against inside wythe of masonry or other construction as shown.
   1. Fill cracks and open gaps in insulation with crack sealer compatible with insulation and masonry.

3.7 MASONRY-CELL INSULATION

A. Pour granular insulation into cavities to fill void spaces. Maintain inspection ports to show presence of insulation at extremities of each pour area. Close the ports after filling has been confirmed. Limit the fall of insulation to 1 story high, but not more than 20 feet.

B. Install molded-polystyrene insulation units into masonry unit cells before laying units.

3.8 MASONRY JOINT REINFORCEMENT

A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcement a minimum of 6 inches.
   1. Space reinforcement not more than 16 inches o.c.
   2. Space reinforcement not more than 8 inches o.c. in foundation walls and parapet walls.
   3. Provide reinforcement not more than 8 inches above and below wall openings and extending 12 inches beyond openings in addition to continuous reinforcement.
B. Interrupt joint reinforcement at control and expansion joints unless otherwise indicated.

C. Provide continuity at wall intersections by using prefabricated T-shaped units.

D. Provide continuity at corners by using prefabricated L-shaped units.

E. Cut and bend reinforcing units as directed by manufacturer for continuity at returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

3.9 ANCHORING MASONRY TO STRUCTURAL STEEL AND CONCRETE

A. Anchor masonry to structural steel and concrete where masonry abuts or faces structural steel or concrete to comply with the following:

1. Provide an open space not less than 1/2 inch wide between masonry and structural steel or concrete unless otherwise indicated. Keep open space free of mortar and other rigid materials.
2. Anchor masonry with anchors embedded in masonry joints and attached to structure.
3. Space anchors as indicated, but not more than 16 inches o.c. vertically and 24 inches o.c. horizontally.

3.10 ANCHORING MASONRY VENEERS

A. Anchor masonry veneers to concrete and masonry backup with masonry-veneer anchors to comply with the following requirements:

1. Fasten anchors to concrete and masonry backup with metal fasteners of type indicated. Use two fasteners unless anchor design only uses one fastener.
2. Embed tie sections in masonry joints. Provide not less than 2 inches of air space between back of masonry veneer and face of sheathing.
3. Locate anchor sections to allow maximum vertical differential movement of ties up and down.
4. Space anchors as indicated, but not more than 16 inches o.c. vertically and 24 inches o.c. horizontally, with not less than 1 anchor for each 2 sq. ft. of wall area. Install additional anchors within 12 inches of openings and at intervals, not exceeding 8 inches, around perimeter.

3.11 CONTROL AND EXPANSION JOINTS

A. General: Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.

B. Form control joints in concrete masonry as follows:

1. Fit bond-breaker strips into hollow contour in ends of CMUs on one side of control joint. Fill resultant core with grout and rake out joints in exposed faces for application of sealant.

C. Form expansion joints in brick as follows:

1. Build in compressible joint fillers where indicated.
2. Form open joint full depth of brick wythe and of width indicated, but not less than 3/8 inch for installation of sealant and backer rod specified in Division 07 Section "Joint Sealants."
D. Provide horizontal, pressure-relieving joints by either leaving an air space or inserting a compressible filler of width required for installing sealant and backer rod specified in Division 07 Section "Joint Sealants," but not less than 3/8 inch.

1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

3.12 LINTELS

A. Install steel lintels where indicated.

B. Where indicated, cut lip in brick to be ¾" x ¾" – see details on Drawings. Lip should be proper size for installation of lintel, mortar bed and flashing while maintaining a normal size soft joint to receive sealant below the steel lintel.

C. Provide minimum bearing of 8 inches at each jamb unless otherwise indicated.

3.13 FLASHING, WEEP HOLES, CAVITY DRAINAGE, AND VENTS

A. General: Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated.

B. Install flashing according to the requirements of Division 07 Section "Sheet Metal Flashing and Trim," and as follows unless otherwise indicated:

1. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as recommended by flashing manufacturer.

2. At multiwythe masonry walls, including cavity walls, extend flashing through outer wythe, turned up a minimum of 4 inches, and 1-1/2 inches into the inner wythe. Form 1/4-inch hook in edge of flashing embedded in inner wythe.

3. At masonry-veneer walls, extend flashing through veneer, across air space behind veneer, and up face of sheathing at least 8 inches; with upper edge tucked under building paper or building wrap, lapping at least 4 inches.

4. At lintels and shelf angles, extend flashing a minimum of 6 inches into masonry at each end. At heads and sills, extend flashing 6 inches at ends and turn up not less than 2 inches to form end dams.

5. Interlock end joints of ribbed sheet metal flashing by overlapping ribs not less than 1-1/2 inches or as recommended by flashing manufacturer, and seal lap with elastomeric sealant complying with requirements in Division 07 Section "Joint Sealants" for application indicated.

6. Install metal drip edges and sealant stops with ribbed sheet metal flashing by interlocking hemmed edges to form hooked seam. Seal seam with elastomeric sealant complying with requirements in Division 07 Section "Joint Sealants" for application indicated.

C. Install reglets and nailers for flashing and other related construction where they are shown to be built into masonry.

D. Install weep holes in head joints in exterior wythes of first course of masonry immediately above embedded flashing and as follows:

1. Use specified weep/vent products to form weep holes.
2. Use wicking material to form weep holes above flashing under brick sills. Turn wicking down at lip of sill to be as inconspicuous as possible.
3. Space weep holes formed from wicking material 16 inches o.c.
4. Trim wicking material flush with outside face of wall after mortar has set.
E. Place cavity drainage material in cavities to comply with configuration requirements for cavity drainage material in "Miscellaneous Masonry Accessories" Article.

F. Install vents in head joints in exterior wythes as indicated, spaced @ 16” o.c. Use specified weep/vent products to form vents.

3.14 REINFORCED UNIT MASONRY INSTALLATION

A. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.

1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated. Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other loads that may be placed on them during construction.

B. Placing Reinforcement: Comply with requirements in ACI 530.1/ASCE 6/TMS 602.

C. Grouting: Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure.

1. Comply with requirements in ACI 530.1/ASCE 6/TMS 602 for cleanouts and for grout placement, including minimum grout space and maximum pour height.
2. Limit height of vertical grout pours to not more than 60 inches.

3.15 FIELD QUALITY CONTROL

A. Testing and Inspecting: Owner will engage special inspectors to perform tests and inspections and prepare reports. Allow inspectors access to scaffolding and work areas, as needed to perform tests and inspections. Retesting of materials that fail to comply with specified requirements shall be done at Contractor's expense.

B. Inspections: Level 1 special inspections according to the "International Building Code."

1. Begin masonry construction only after inspectors have verified proportions of site-prepared mortar.
2. Place grout only after inspectors have verified compliance of grout spaces and of grades, sizes, and locations of reinforcement.
3. Place grout only after inspectors have verified proportions of site-prepared grout.

C. Testing Prior to Construction: One set of tests.

D. Testing Frequency: One set of tests for each 5000 sq. ft. of wall area or portion thereof.

E. Clay Masonry Unit Test: For each type of unit provided, according to ASTM C 67 for compressive strength.

F. Concrete Masonry Unit Test: For each type of unit provided, according to ASTM C 140 for compressive strength.

G. Mortar Aggregate Ratio Test (Proportion Specification): For each mix provided, according to ASTM C 780.
H. Mortar Test (Property Specification): For each mix provided, according to ASTM C 780. Test mortar for mortar air content and compressive strength.

I. Grout Test (Compressive Strength): For each mix provided, according to ASTM C 1019.

J. Prism Test: For each type of construction provided, according to ASTM C 1314 at 7 days and at 28 days.

3.16 REPAIRING, POINTING, AND CLEANING

A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.

B. Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application, where indicated.

C. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
   1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
   2. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Architect's approval of sample cleaning before proceeding with cleaning of masonry.
   3. Protect adjacent stone and nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
   4. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
   6. Clean concrete masonry by cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.
   7. Clean stone trim to comply with stone supplier's written instructions.
   8. Clean limestone units to comply with recommendations in ILI's "Indiana Limestone Handbook."

3.17 MASONRY WASTE DISPOSAL

A. Salvageable Materials: Unless otherwise indicated, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.

B. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.
   1. Crush masonry waste to less than 4 inches in each dimension.
   2. Mix masonry waste with at least two parts of specified fill material for each part of masonry waste. Fill material is specified in Division 31 Section "Earth Moving."
   3. Do not dispose of masonry waste as fill within 18 inches of finished grade.

C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other masonry waste, and legally dispose of off Owner's property.
SECTION 04 43 00 - STONE MASONRY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following applications of stone masonry:
   1. Anchored to concrete backup.
   2. Anchored to unit masonry backup.
   3. Anchored to structural steel and metal fabrications.
   4. Anchored to cold-formed metal framing and sheathing in interior applications.
   5. Types and locations of stone include:
      a. Exterior limestone veneer
      b. Interior limestone veneer
      c. Interior granite veneer
      d. Interior sandstone veneer
   6. Through-wall flashing for stone masonry is included in this section, but shall also comply with the requirements of Division 7 section “Flashing and Sheet Metal.”
   7. All miscellaneous metal fabrications required for support of stone masonry is work of this section, but shall also comply with the requirements of division 5 Section “Metal Fabrications.”

B. Related Sections:
   1. Division 03 Section "Cast-in-Place Concrete" for dovetail slots in concrete for anchoring stone.
   2. Division 04 Section "Unit Masonry" for cavity-wall insulation, concealed flashing, horizontal joint reinforcement and veneer anchors.
   3. Division 04 Section “Stone Veneer Site Walls” for stone types and finishes to match those in this section.
   4. Division 07 Section "Thermal Insulation" for cavity-wall insulation installed between stone masonry and backup material.
   5. Division 07 Section "Sheet Metal Flashing and Trim" for exposed sheet metal flashing other than the flashing specified in this section.
   6. Division 09 Section “Stone Flooring” for stone types and finishes to match those in this section.

C. Products installed, but not furnished, in this Section include:
   1. Steel lintels and shelf angles for stone masonry specified in Division 05 Section "Metal Fabrications."

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide stone masonry cladding capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

B. All anchorage components, miscellaneous metal fabrications and cold formed framing systems indicated on the drawings for support of stone are diagrammatic and are not intended to be
complete or to restrict the Prime Contractor to specific anchorage or support systems. The Stone masonry Contractor shall be solely responsible for the structural performance of all stone work, including but not limited to the following, at no additional cost to the Owner:

1. Stone anchorage systems types for gravity anchors, wind/lateral anchors, and other conditions as indicated or required.
2. The systems utilized for attachment of exterior stone gravity and wind/lateral anchors to existing back-up wall as required to prevent movement or slipping of anchors. The method of attachment and types of anchors, metal fabrications and other materials and accessories shall be designed and selected by the Prime Contractor based on both the specified performance requirements and the limitations of the strength of the existing backup wall materials and wall systems design.
3. Coordination of anchor systems with existing back up structure as required.

C. Thermal Movements: Provide stone masonry cladding system that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing displacement of stone, opening of joints, overstressing of components, failure of joint sealants and connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

D. Design stone supports and anchors, including cold formed steel backup framing systems, miscellaneous metal support fabrications and connections to building structure, to withstand loads indicated without exceeding allowable stresses established by the following:

2. For Cold-Formed Steel: AISI SG-673, Part I, "Specification for the Design of Cold-Formed Steel Structural Members."
3. For Cold-Formed Stainless Steel: ASCE 8, "Specification for the Design of Cold-Formed Stainless Steel Structural Members."
4. For Cast-in-Place and Post-Installed Anchors in Concrete: One-fourth of anchor's tested capacity when installed in concrete with compressive strength indicated.
5. For Post-Installed Anchors in Grouted Concrete Masonry Units: One-sixth of anchor's tested capacity when installed in concrete masonry units indicated.

E. Limit deflection in each cold formed steel backup framing system assembly caused by indicated loads and thermal movements, acting singly or in combination with one another, to the deflection that the stone can withstand, but not more than the following maximums:

1. 1/16 inch, measured in plane of wall.
2. 1/720 of panel's clear span but not more than 1/4 inch, measured perpendicular to wall.

F. Provisions for Fabrication and Erection Tolerances: Allow for fabrication and erection tolerances and for structural deflections from loads and other causes.

1. Coordinate with existing backup wall conditions.
2. Structural-steel fabrication and erection tolerances are specified in Division 5 Section "Structural Steel."
3. Allow for vertical deflection of L/600 or 3/8" in 20-foot span of structural members supporting stone masonry cladding system due to loads (including live loads) imposed on building’s structural frame after stone installation.

G. Control of Corrosion and Staining: Prevent galvanic and other forms of corrosion as well as staining by isolating metals, air/water barrier, sealants, backer rods and other materials from direct contact with incompatible materials. Use materials that are nonstaining to exposed surfaces of stone and joint materials.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.
1. For stone varieties proposed for use on Project, include test data indicating compliance with physical properties required by referenced ASTM standards.

B. Shop Drawings: Show details of fabrication and installation of stone masonry cladding, including dimensions and profiles of stone units; arrangement and details of jointing, supporting, anchoring, and bonding stone masonry cladding; and details showing relationship with, attachment to, and reception of adjacent construction and all related work.
   1. Include large scale elevations of all existing façade stone and proposed façade stone, indicating actual joint locations and sizes.
   2. Include large-scale details of decorative surfaces and inscriptions.
   3. Include complete information and details for miscellaneous metal support fabrications including attachment to supporting materials.
   4. Include complete shop drawings and installation details for air/water barrier.
   5. Include complete shop drawings and installation details for flashing and break-formed flashing profiles.

C. Samples for Initial Selection: For colored mortar and other items involving color selection.

D. Samples for Verification:
   1. For each stone type indicated. Include at least five samples in each set for each type of stone, exhibiting extremes of the full range of color and other visual characteristics expected in completed Work. Samples will establish the standard by which stone provided will be judged.
   2. Provide two cut corner limestone units, full thickness of veneer stone to be used in project and 8” in height.
   3. Contractor’s Option: Provide two sample preassembled mitered corner units of limestone bonded together with adhesive and stainless steel corner pins. Samples to be full thickness of veneer stone used in project, 8”in height.
   4. For each color of mortar required. Label Samples to indicate types and amounts of pigments used.
   5. Samples of each type of anchor and accessory specified.
   6. Samples of each break-formed flashing profile required.

E. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, sources of supply, and other information as required to identify materials used. Include mix proportions for mortar and source of aggregates.
   1. Submittal is for information only. Neither receipt of list nor approval of mockups constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Architect and approved in writing.

F. Qualification Data: For qualified Installer.

G. Engineering Analysis: Submit engineering analysis signed and sealed by a qualified professional engineer for stone masonry cladding, miscellaneous metal fabrications, cold formed steel framing backup systems and stone anchorage system including drawings and comprehensive engineering analysis that shows the system’s compliance with specified requirements.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced installer who has completed stone masonry cladding similar in material, design, and extent to that indicated for Project that has resulted in construction with a record of successful in-service performance.
   1. Installer shall assume responsibility for engineering, fabricating, and installing stone masonry cladding system.
   2. Engineering Responsibility: Engage a qualified professional engineer to prepare or supervise the preparation of data for stone masonry cladding, miscellaneous metal fabrications, cold formed steel framing backup systems and stone anchorage system including drawings and
comprehensive engineering analysis that shows the system’s compliance with specified requirements.

3. Engineer shall be licensed in the commonwealth of Pennsylvania, and shall provide proof and references from the design of three (3) previous stone support systems

B. Source Limitations for Stone: Obtain stone, regardless of finish, from one quarry with resources to provide materials of consistent quality in appearance and physical properties.

C. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

D. Mockups: Build mockups to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Build mockup of typical wall area as shown on Drawings.
      a. First mockup consists of stonework integrated into freestanding wall section combined with other materials such as Unit Masonry, Curtain Wall, etc.
      b. Second mockup consists of in-place installation of stone pieces and accessories indicated in the Drawings.
   2. Protect accepted mockups from the elements with weather-resistant membrane.
   3. Approval of mockups is for color, texture, and blending of stone; relationship of mortar and sealant colors to stone colors; tooling of joints; and aesthetic qualities of workmanship.
      a. Approval of mockups is also for other material and construction qualities Architect specifically approves in writing.
      b. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   4. Protect and maintain mockup as a reference until the conclusion of construction.
   5. Second in-place mockup may become part of the completed Work if undisturbed at time of Substantial Completion.

E. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

B. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

C. Deliver preblended, dry mortar mix in moisture-resistant containers designed for lifting and emptying into dispensing silo. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in a metal dispensing silo with weatherproof cover.

D. Store stone masonry and masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.
   1. Lift with wide-belt slings; do not use wire rope or ropes that might cause staining. Move stone, if required, using dollies with cushioned wood supports.
   2. Store stone on wood skids or pallets with nonstaining, waterproof covers. Arrange to distribute weight evenly and to prevent damage to stone. Ventilate under covers to prevent condensation.
1.7 PROJECT CONDITIONS

A. Protection of Stone Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed stone masonry when construction is not in progress.
   1. Extend cover a minimum of 24 inches down both sides and hold cover securely in place.

B. Stain Prevention: Immediately remove mortar and soil to prevent them from staining the face of stone masonry.
   1. Protect base of walls from rain-splashed mud and mortar splatter by coverings spread on the ground and over the wall surface.
   2. Protect sills, ledges, and projections from mortar droppings.
   3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.
   4. Turn scaffold boards near the wall on edge at end of each day to prevent rain from splashing mortar and dirt on completed stone masonry.

C. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace stone masonry damaged by frost or freezing conditions. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.
   1. Cold-Weather Construction: When ambient temperature is within limits indicated, use the following procedures:
      a. At 40 deg F and below, produce mortar temperatures between 40 and 120 deg F by heating mixing water and, at temperatures of 32 deg F and below, sand. In heating mortar materials, maintain mixing temperatures selected within 10 deg F; do not heat water for mortar to above 160 deg F. Maintain temperature of mortar on boards above freezing.
      b. At 25 to 20 deg F, heat both sides of walls under construction. Use windbreaks or enclosures when wind velocity exceeds 15 mi./h.
      c. At 20 deg F and below, provide enclosure and auxiliary heat to maintain air temperature above 32 deg F within enclosure. Heat stone so it is above 40 deg F at time of installation.
   2. Cold-Weather Protection: When mean daily temperature is within limits indicated, provide the following protection:
      a. 40 to 25 deg F: Cover stone masonry cladding with a weather-resistant membrane for 48 hours after construction.
      b. 25 to 20 deg F: Cover stone masonry cladding with insulating blankets or provide enclosure and heat to maintain air temperature above 32 deg F within enclosure for 48 hours after construction. Use windbreaks or enclosures when wind velocity exceeds 15 mi./h.
      c. 20 deg F and Below: Provide enclosure and heat to maintain air temperature above 32 deg F within enclosure for 48 hours after construction.
   3. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and above and will remain so until masonry has dried, but not less than 7 days after completing cleaning.

1.8 COORDINATION

A. Advise installers of other work about specific requirements for placement of reinforcement, veneer anchors, flashing, and similar items to be built into stone masonry.
PART 2 - PRODUCTS

2.1 LIMESTONE

A. Limestone: Comply with ASTM C 568.
   1. Products: Indiana oolitic limestone quarried in Lawrence, Monroe, or Owen Counties, Indiana.
   2. Classification: II Medium-Density.

B. Indiana Oolitic Limestone Grade, Color, and Finish: Select Grade; Buff Color; Smooth, machine finish, complying with indicated grade, color classification and finish standard established by Indiana Limestone Institute of America (ILI).
   1. Match existing limestone on Henderson North Building for color, uniformity of color, finish, and other stone characteristics relating to aesthetic effects.

C. Natural defects in the stone with visual variations beyond those present in the existing building will not be acceptable.

2.2 GRANITE

A. Granite: Comply with ASTM C 615.
   1. Products: Subject to compliance with requirements, provide Virginia Mist, Jet Mist or equivalent as manufactured by North Carolina Granite, Inc. and distributed by Architectural Craft Stone Source, Inc., Flushing, NY 11367, or equal. Tel: 718.820.8885.
      a. Granite Veneer, Finish 1 – Honed, as defined by Architectural Craft Stone Source.
      b. Granite Veneer, Finish 2 – Smooth, as defined by Architectural Craft Stone Source.
      d. Thickness as shown in the Drawings.

B. Match Architect's samples for color, finish, and other stone characteristics relating to aesthetic effects.

2.3 SANDSTONE

A. Sandstone shall be Briar Hill Sandstone (Massillon formation), dimensions indicated on the Drawings, manufactured by Briar Hill Stone Co., Glenmont, OH 44628, or approved equal. Contact (216) 377-5100.
   1. Majority of sandstone work to be Sandstone Veneer, Finish 1 – Rough.
   2. Where indicated on Drawings, provide Sandstone Veneer, Finish 2 – Smooth.

B. Sandstone shall be a range of light, medium, and dark buff colors with rock face finish.

2.4 MORTAR MATERIALS

A. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather construction. Provide natural color or white cement as required to produce mortar color indicated.
   1. Low-Alkali Cement: Not more than 0.60 percent total alkali when tested according to ASTM C 114.

B. Hydrated Lime: ASTM C 207, Type S.

C. Portland Cement-Lime Mix: Packaged blend of portland cement complying with ASTM C 150, Type I or III, and hydrated lime complying with ASTM C 207.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Essroc, Italcementi Group; Capitol PCL Blend or Saylor's Plus.
D. Mortar Pigments: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes. Use only pigments with a record of satisfactory performance in stone masonry mortar.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Davis Colors; True Tone Mortar Colors.
      b. Lanxess Corporation; Bayferrox Iron Oxide Pigments.
      c. Solomon Colors; SGS Mortar Colors.

E. Aggregate: ASTM C 144 and as follows:
   1. For pointing mortar, use aggregate graded with 100 percent passing No. 16 sieve.
   2. Colored Aggregates: Natural-colored sand or ground marble, granite, or other sound stone; of color necessary to produce required mortar color.
      a. Match mortar used in limestone work at Henderson North building.

F. Water: Potable.

2.5 ANCHORS

A. Provide anchors of type and size required to support stone masonry cladding and to sustain imposed loads. Select stone anchors and anchor fasteners which are suitable for existing back up wall substrate. Coordinate anchor design with existing in-place adjacent stone masonry. Fabricate from the following metals for conditions indicated:
   1. Stainless Steel: ASTM A 666, Type 304, temper as required to support loads imposed without exceeding allowable design stresses.
      a. Fasteners for Stainless-Steel Anchors: Annealed stainless-steel bolts, nuts, and washers of same alloy as anchors. ASTM F 593 for bolts and ASTM F 594 for nuts.

B. Post-Installed Anchors in Backup Construction: Anchors of type indicated below, fabricated from corrosion-resistant materials, with capability to sustain, without failure, load imposed within factors of safety indicated for connections, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency. Coordinate anchor type with backup wall construction.
   2. Chemical anchors.
   3. Expansion anchors.
   4. Undercut anchors.

2.6 EMBEDDED FLASHING MATERIALS

A. Metal Flashing: Provide metal flashing complying with Division 07 Section "Sheet Metal Flashing and Trim."

B. Metal Flashing: Provide metal flashing, where flashing is exposed or partly exposed and where indicated, complying with SMACNA's "Architectural Sheet Metal Manual and Division 07 Section "Sheet Metal Flashing and Trim" and as follows:
   1. Stainless Steel: ASTM A 240/A 240M, Type 304, 0.016 inch thick.
   2. Fabricate continuous flashings in sections 96 inches long minimum, but not exceeding 12 feet.
   3. Do not expose cut edges of sheet metal except as shown. Fold back exposed ends of unsupported sheet metal to form a 1/2" wide hem on the concealed side, or ease exposed edges with backing to a radius of approximately 1/32". Form items with flat, flush surfaces, true to line and level, and without cracking and grain separation at bends.
4. Continuously weld all joints and seams except where other methods of joining are indicated; grind welds smooth and flush on exposed surfaces. Comply with AWS and other metal authorities.
   a. Use filler metals and welding procedures which will blend with and match the color of sheet metal being joined and will avoid discoloration at welds.

5. Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.
   a. Size: As recommended by SMACNA manual or sheet metal manufacturer for application but never less than thickness of metal being secured.

6. Fabricate through-wall flashing with drip edge as detailed in the Drawings unless otherwise indicated.

7. See Division 07 Section “Sheet Metal Flashing and Trim” for all other flashings not described here.

C. Solder and Sealants for Sheet Metal Flashings:
   1. Solder for Stainless Steel: ASTM B 32, Grade Sn60, with acid flux of type recommended by stainless-steel sheet manufacturer.
   2. Solder for Copper: ASTM B 32, Grade Sn50, 50 percent tin and 50 percent lead.

2.7 LEAD T-CAP WEATHERSTRIPPING

A. Lead T-Cap: Soft lead strip to be set and bedded in joint sealant to form a cap and assure a permanent elastic seal for masonry joint.
   1. Provide Lead T-Cap by Nuclead, or equal.
   2. Size per manufacturer’s instructions based upon width of masonry joint.
   3. Installation locations:
      a. Top, side and cross joints of copings. Extend from outer face, across the top of the coping and down parapet side.
      b. All cross joints on cornices and belt courses that are not flashed. Carry down front face of stone to first change in contour.

2.8 MISCELLANEOUS MASONRY ACCESSORIES

A. Compressible Filler: Premolded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from closed cell neoprene.

B. Weep/Vent Products: Use the following unless otherwise indicated:
   1. Wicking Material: Absorbent rope, made from cotton, 1/4 to 3/8 inch in diameter, in length required to produce 2-inch exposure on exterior and 18 inches in cavity. Use only for weeps.

C. Cavity Drainage Material: Free-draining mesh, made from polymer strands that will not degrade within the wall cavity.
   1. Provide one of the following configurations:
      a. Strips, not less than 1-1/2 inches thick and 10 inches wide, with dimpled surface designed to catch mortar droppings and prevent weep holes from being clogged with mortar.
      2. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
         a. Advanced Building Products Inc.; Mortar Break II.
         b. CavClear/Archovations, Inc.; CavClear Masonry Mat.
         c. Dur-O-Wal, a Dayton Superior Company; Polytite MortarStop.
         d. Mortar Net USA, Ltd.; Mortar Net.
D. Setting Buttons: Lead or resilient plastic buttons, nonstaining to stone, sized to suit joint thicknesses and bed depths of stone masonry cladding involved without intruding into required depths of joint sealants or causing third-side adhesion between sealant and setting button.

E. Epoxy: Two-component epoxy adhesive for joining preassembled L-shaped limestone pieces to be used at building corners, soffits and fascia.

F. Type 304 or 316 stainless steel pins for joining preassembled L-shaped limestone pieces to be used at building corners, soffits and fascia.

G. Dampproofing for Back of Limestone Panels: Apply bituminous material to limestone at grade as indicated on the Drawings.

2.9 CAVITY-WALL INSULATION

A. See Division 04 Section “Unit Masonry” for cavity-wall insulation to be used in both Unit Masonry and Stone Masonry wall construction.

2.10 MASONRY CLEANERS & SEALERS

A. Proprietary Acidic Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar and grout stains, efflorescence, and other new construction stains from stone masonry surfaces without discoloring or damaging masonry surfaces; expressly approved for intended use by cleaner manufacturer and stone producer.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Diedrich Technologies, Inc.
   b. Dominion Restoration Products.
   c. EaCo Chem, Inc.
   d. Hydrochemical Techniques, Inc.
   e. Prosoco, Inc.

B. Limestone & Sandstone Sealer: Provide stone supplier’s recommended sealer product for limestone and sandstone veneers. Sealer to be matte finish, non-staining, non-color changing.

2.11 MORTAR MIXES

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

1. Do not use calcium chloride.
2. Limit cementitious materials in mortar to portland cement and lime.
3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.
4. Mixing Pointing Mortar: Thoroughly mix cementitious and aggregate materials together before adding water. Then mix again, adding only enough water to produce a damp, unworkable mix that will retain its form when pressed into a ball. Maintain mortar in this dampened condition for one to two hours. Add remaining water in small portions until mortar reaches desired consistency. Use mortar within 30 minutes of final mixing; do not retemper or use partially hardened material.

1. Mortar for Setting Stone: Type N.
2. Mortar for Pointing Stone: Type N.

C. Pigmented Mortar: Use colored cement product or select and proportion pigments with other ingredients to produce color required. Do not add pigments to colored cement products.

1. Pigments shall not exceed 10 percent of portland cement by weight.
2. Mix to match Architect's sample.

D. Colored-Aggregate Mortar: Produce required mortar color by using colored aggregates and natural color or white cement as necessary to produce required mortar color.
   1. Mix to match Architect's sample.

2.12 FABRICATION

A. Fabricate stone to comply with sizes, shapes, and tolerances recommended by applicable stone association or, if none, by stone source, for faces, edges, beds, and backs.
   1. For granite, comply with recommendations in NBGQA's "Specifications for Architectural Granite."
   2. For limestone, comply with recommendations in ILI's "Indiana Limestone Handbook."

B. Cut stone to produce pieces of thickness, size, and shape indicated, including details on Drawings. Dress joints (bed and vertical) straight and at right angle to face unless otherwise indicated.

C. Cut stone to produce joints of uniform width and in locations indicated.
   1. Typical Joint Width: 1/8 inch except as otherwise indicated.

D. Cut and drill sinkages and holes in stone for anchors and supports.

E. Carefully inspect stone at quarry or fabrication plant for compliance with requirements for appearance, material, and fabrication. Replace defective units before shipment.
   1. Clean sawed backs of stone to remove rust stains and iron particles.

F. Gage backs of stones for adhered veneer if more than 81 sq. in. in area.

G. Thickness of Stone: Provide thickness indicated, but not less than the following:
   1. Thickness: 4 inches plus or minus 1/4 inch. Thickness does not include projection of pitched faces.

H. Shape stone for type of masonry (pattern) as follows:
   1. Sawed-bed, range ashlar with uniform course heights and uniform lengths as indicated on Drawings.

I. Contractor’s Option: In lieu of cut L-shaped corner stones, provide preassembled mitered stone corner pieces. Mitered corner stones to be joined using two-part epoxy and stainless steel pins in accordance with recommendations listed in the Indiana Limestone Handbook (article 2.5), latest edition.

J. Finish exposed faces and edges of stone to comply with requirements indicated for finish and to match approved samples and mockups.
   1. Finish: Smooth.
   2. Finish for Sills: Smooth.
      a. Finish exposed ends of copings same as front and back faces.

K. Fabricate molded work, including washes and drips, to produce stone shapes with a uniform profile throughout entire unit length and with precisely formed arris slightly eased to prevent snipping, and matched at joints between units.
   1. Produce moldings with machines having abrasive shaping wheels made to reverse contour of molding shape; do not sculpt moldings.

L. Carefully inspect finished stone units at fabrication plant for compliance with requirements for appearance, material, and fabrication. Replace defective units.
1. Grade and mark stone for overall uniform appearance when assembled in place. Natural variations in appearance are acceptable if installed stone units match range of colors and other appearance characteristics represented in approved samples and mockups.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces indicated to receive stone masonry, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine substrate to verify that dovetail slots, inserts, reinforcement, veneer anchors, flashing, and other items installed in substrates and required for or extending into stone masonry are correctly installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the installation shall constitute acceptance of the surfaces to receive stone masonry and conditions under which stone masonry shall be installed.

3.2 PREPARATION

A. Coat concrete and unit masonry backup with asphalt dampproofing.

B. Protect stone masonry work during erection as follows:
   1. Cover tops of walls with nonstaining, waterproof sheeting at end of each day's work. Cover partially completed structures when work is not in progress. Extend cover a minimum of 24 inches down both sides and hold securely in place.
   2. Prevent staining of stone from mortar, grout, sealants, and other sources. Immediately remove such materials without damaging stone.
   3. Protect base of walls from rain-splashed mud and mortar splatter by coverings spread on ground and over wall surface.
   4. Protect sills, ledges, and projections from mortar and sealant droppings.

C. Clean dirty or stained stone surfaces by removing soil, stains, and foreign materials before setting. Clean stone by thoroughly scrubbing with fiber brushes and then drenching with clear water. Use only mild cleaning compounds that contain no caustic or harsh materials or abrasives.

3.3 SETTING OF STONE MASONRY, GENERAL

A. Arrange stones with color and size variations uniformly dispersed for an evenly blended appearance.

B. Set stone to comply with requirements indicated on Drawings. Install supports, fasteners, and other attachments indicated or necessary to secure stone masonry in place. Set stone accurately in locations indicated with edges and faces aligned according to established relationships and indicated tolerances.

C. Provide sealant joints of widths and at locations indicated.
   1. Keep sealant joints free of mortar and other rigid materials.
   2. Sealing joints is specified in Division 07 Section "Joint Sealants."

D. Install embedded flashing and weep holes at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated.
1. At multiwythe masonry walls, including cavity walls, extend flashing through stone masonry, turned up a minimum of 8 inches, and extend into or through inner wythe to comply with requirements in Division 04 Section "Unit Masonry."

2. At lintels and shelf angles, extend flashing full length of angles but not less than 6 inches into masonry at each end.

3. At sills, extend flashing not less than 4 inches at ends.

4. At ends of head and sill flashing turn up not less than 2 inches at ends.

5. Interlock end joints of ribbed sheet metal flashing by overlapping ribs not less than 1-1/2 inches or as recommended by flashing manufacturer, and seal lap with elastomeric sealant complying with requirements in Division 07 Section “Joint Sealants” for application indicated.

6. Install metal drip edges with ribbed sheet metal flashing by interlocking hemmed edges to form hooked seam. Seal seam with elastomeric sealant complying with requirements in Division 07 Section "Joint Sealants" for application indicated.

E. Coat limestone with bituminous dampproofing in accordance with the Limestone Institute Manual and as shown on the Drawings, and as follows:

1. Stone Extending below Grade:
   a. First Application: Apply bituminous dampproofing to beds, joints, back surfaces, and face surfaces up to rough grade.
   b. Final Application: Complete application of dampproofing on front face of exposed stone pieces in place after fine grading line has been determined.

2. Allow dampproofing formulations to cure before setting dampproofed stone or final grading. Do not damage or remove dampproofing in the course of handling and setting stone.

F. Keep cavities open where unfilled space is indicated between back of stone masonry cladding and back-up wall.

1. Institute and maintain effective procedures to keep cavities clean. Do not fill cavities with mortar, grout or other materials, including materials resulting from installation of anchors in masonry construction.

2. Place weep holes in joints where moisture may accumulate, including base of cavity walls, above shelf angles, and flashing. Locate weep holes at every vertical joint and where indicated in approved shop drawings.

3. Place vent holes in joints where recommended by referenced standards, including top of cavity walls and below shelf angles and flashing. Locate weep holes at every vertical joint and where indicated in approved shop drawings.

4. Place cavity drainage material immediately above flashing in cavities, as stone masonry construction progresses, to splatter mortar droppings and to maintain drainage.

5. Cut weep and vent holes flush with surface of sealant after installation of sealant.

G. Place weep holes and vents in joints where moisture may accumulate, including at base of cavity walls, above shelf angles, and at flashing.

1. Use wicking material to form weep holes above flashing in stone sills. Turn wicking down at lip of sill to be as inconspicuous as possible.

2. Space weep holes formed from wicking material 16 inches o.c.

3. Trim wicking material used in weep holes flush with outside face of wall after mortar has set.

4. Place cavity drainage material in cavities to comply with configuration requirements for cavity drainage material in "Miscellaneous Masonry Accessories" Article.

H. Install vents in vertical head joints at the top of each continuous cavity at spacing indicated. Use round plastic tubing to form vents.

1. Close cavities off vertically and horizontally with blocking in manner indicated. Install through-wall flashing and weep holes above horizontal blocking.
3.4 CONSTRUCTION TOLERANCES

A. Variation from Plumb: For vertical lines and surfaces, do not exceed 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch in 40 feet or more. For external corners, expansion joints, control joints, and other conspicuous lines, do not exceed 1/4 inch in 20 feet or 1/2 inch in 40 feet or more.

B. Variation from Level: For bed joints and lines of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous lines, do not exceed 1/4 inch in 20 feet or 1/2 inch in 40 feet or more.

C. Variation of Linear Building Line: For position shown in plan, do not exceed 1/2 inch in 20 feet or 3/4 inch in 40 feet or more.

D. Measure variation from level, plumb, and position shown in plan as variation of the average plane of the face of each stone from level, plumb, or dimensioned plane.

E. Variation in Mortar-Joint Thickness: Do not vary from joint size range indicated.

F. Variation in Plane between Adjacent Stones: Do not exceed one-half of tolerance specified for thickness of stone.

3.5 INSTALLATION OF ANCHORED STONE MASONRY

A. Anchor stone masonry to backup with anchors complying with performance criteria defined in this Section. Secure anchors to existing backup wall in compliance with performance criteria.

B. Space anchors as required by performance requirements of this Section.

C. Provide compressible filler in ends of dowel holes and bottoms of kerfs to prevent end bearing of dowels and anchor tabs on stone. Fill remainder of anchor holes and kerfs with mortar.

D. Set stone in full bed of mortar with full head joints unless otherwise indicated. Build anchors into mortar joints as stone is set.

E. Provide minimum 1-inch cavity between stone masonry and backup construction unless otherwise indicated. Keep cavity free of mortar droppings and debris.
   1. Retain first subparagraph below if required by code.
   2. Place mortar spots in cavity at veneer anchors to maintain spacing.
   3. Slope beds toward cavity to minimize mortar protrusions into cavity.
   4. Do not attempt to trowel or remove mortar fins protruding into cavity.

F. Rake out joints for pointing with mortar to depth of not less than 1/2 inch before setting mortar has hardened. Rake joints to uniform depths with square bottoms and clean sides.

3.6 POINTING

A. Prepare stone-joint surfaces for pointing with mortar by removing dust and mortar particles. Where setting mortar was removed to depths greater than surrounding areas, apply pointing mortar in layers not more than 3/8 inch deep until a uniform depth is formed.

B. Point stone joints by placing and compacting pointing mortar in layers not more than 3/8 inch deep. Compact each layer thoroughly and allow to become thumbprint hard before applying next layer.

C. Tool joints, when pointing mortar is thumbprint hard, with a smooth jointing tool to produce the following joint profile:
   1. Joint Profile: Smooth, flat face slightly below edges of stone.
   2. Match profile of joints in stone masonry of adjacent Henderson North Building.
3.7 ADJUSTING AND CLEANING

A. Remove and replace stone masonry of the following description:
   1. Broken, chipped, stained, or otherwise damaged stone. Stone may be repaired if methods
      and results are approved by Architect.
   2. Defective joints.
   3. Stone masonry not matching approved samples and mockups.
   4. Stone masonry not complying with other requirements indicated.

B. Replace in a manner that results in stone masonry matching approved samples and mockups,
   complying with other requirements, and showing no evidence of replacement.

C. In-Progress Cleaning: Clean stone masonry as work progresses. Remove mortar fins and smears
   before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean stone masonry as follows:
   1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or
      chisels.
   2. Test cleaning methods on mockup; leave one-half of panel uncleaned for comparison
      purposes. Obtain Architect's approval of sample cleaning before cleaning stone masonry.
   3. Clean stone masonry not less than 6 days after completion of pointing and sealing, using
      clean water and stiff-bristle fiber brushes. Do not use wire brushes, acid-type cleaning
      agents, cleaning compounds with caustic or harsh fillers, or other materials or methods that
      could damage stone.
      a. Protect adjacent surfaces from contact with cleaner by covering them with liquid
         strippable masking agent, polyethylene film, or waterproof masking tape, approved in
         writing by the manufacturer of each adjacent material.
   4. Clean limestone masonry to comply with recommendations in ILI's "Indiana Limestone
      Handbook."

3.8 EXCESS MATERIALS AND WASTE

A. Excess Stone: Stack excess stone where directed by Owner for Owner's use.

B. Disposal as Fill Material: Dispose of clean masonry waste, including mortar and excess or soil-
   contaminated sand, by crushing and mixing with fill material as fill is placed.
   1. Crush masonry waste to less than 4 inches in greatest dimension.
   2. Mix masonry waste with at least two parts of specified fill material for each part of masonry
      waste. Fill material is specified in Division 31 Section "Earth Moving."
   3. Do not dispose of masonry waste as fill within 18 inches of finished grade.

C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as
   described above, and other waste, and legally dispose of off Owner's property.

END OF SECTION 04 43 00
SECTION 04 4310 - STONE VENEER SITE WALLS [C]

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following applications:

1. Providing Sandstone Veneer for walls at the Garden Area, and the Lawn Terrace and Stage Power Support Wall.

2. Provide Limestone Veneer that matches the existing North Henderson building’s base and site walls. Limestone supplied for all new walls shall also be required to match limestone supplied for the exterior veneer and trim of the new Biobehavioral Health Building. [C]

B. Related Sections include:
1. Division 2, Section 03301, Cast-in-Place Concrete

1.2 SUBMITTALS

A. Stone Samples: For color, grade, finish, and variety of stone.

B. Colored Mortar Samples: For color range.

C. Qualification Data: For stone mason installer.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: An installer who employs experienced stone masons and stone fitters who are skilled in installing stone veneer assemblies similar in material, design, and extent to those indicated for this Project and whose projects have a record of successful in-service performance.

B. Mockups: Build mockups to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution.

1. Build mockup of stone veneer assembly in sizes approximately 36 inches long by 18 inches high by full thickness, including face and backup. Approved mock may be used as part of completed wall assembly if approved without changes.

1.4 PROJECT CONDITIONS

A. Protection of Stone Veneer Assemblies: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day’s work.

B. Stain Prevention: Immediately remove mortar and soil to prevent them from staining the face of stone veneer assemblies.
C. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen subgrade or setting beds. Comply with cold-weather construction requirements contained in ACI 530.1/ASCE 6/TMS 602.

   1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and above and will remain so until masonry has dried.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

   1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the products specified.
   2. Products: Subject to compliance with requirements, provide one of the products specified.

2.2 SANDSTONE

A. General: Fabricate stone in sizes and shapes necessary to comply with requirements indicated, including details on Drawings.

B. Sandstone veneer shall be Briar Hill Sandstone (Massillon formation), dimensions indicated on the Drawings, manufactured by Briar Hill Stone Co., Glenmont, OH 44628, or approved equal. Contact (216) 377-5100.

C. Sandstone shall be a range of light, medium, and dark buff colors with rock face finish.

D. Provide stone 6" Ht. x 5" Depth, and in random lengths from 6" to 42".

E. Finish exposed faces and edges of stone to comply with requirements indicated for finish and to match approved samples and mockups.

   1. Finish for veneer facing stone: rock pitch edge, natural cleft top and bottom.
   2. Copingstone shall extend 1" beyond the face of wall.

2.3 LIMESTONE

A. Limestone: Comply with ASTM C 568.

   1. Products: Indiana oolitic limestone quarried in Lawrence, Monroe, or Owen Counties, Indiana.
   2. Classification: II Medium-Density.

B. Indiana Oolitic Limestone Grade, Color, and Finish: Select Grade; Buff Color; Smooth, machine finish, complying with indicated grade, color classification and finish standard established by Indiana Limestone Institute of America (ILI).
1. Match existing limestone on Henderson North Building for color, uniformity of color, finish, and other stone characteristics relating to aesthetic effects.

C. Natural defects in the stone with visual variations beyond those present in the existing building will not be acceptable.

2.4 GENERAL

A. Beds and Joints: Pieces shall be bedded and jointed as shown on the approved shop drawings, and bed joint and vertical joint surfaces shall be cut with 3/16 in. beds and joints, as indicated on the approved shop drawings, sawn or cut full square back from the face at least two-thirds of the piece thickness. From that point the bed may fall under square not more than 1 in.

B. Back of stone which will be concealed in the finished work shall be sawn to approximately true planes. Maximum variation in thickness shall be 3/16 in. Sawn backs shall be cleaned of rust stains and iron particles.

C. All faces shall be at right angles to the plane of the top.

D. Stone shall be accurately cut to required shape and dimensions.

E. Holes, cut-outs, sinkages and openings in stone work for anchors, cramps, dowels, supports, and lifting devices, shall be accurately cut or drilled to required dimensions, as shown on the approved shop drawings, and as necessary to secure granite in place to insure correct location and accurate fit of all fixtures. Setting beds shall be shaped to fit supports.

F. Arrises shall be cut sharp and true to square, and continuous with adjoining arrises. Where exposed, arrises shall be eased.

2.5 SETTING BED MORTAR

A. Setting bed mortar shall conform to ASTM C 270, Type S, except that latex polymer additive shall be mixed with the cementitious materials and aggregate in lieu of water.

1. Cement shall conform to ASTM C 150, complying with the staining requirements of ASTM C91 for not more than 0.03% water-soluble alkali as per ASTM C 114. Furnish Type I, except Type III may be used for cold-weather construction.

2. Sand shall conform to ASTM C 144.

3. Hydrated lime shall conform to ASTM C 207.

4. Latex polymer additive shall be equal to "Laticrete 4237" setting liquid, manufactured by Laticrete International, Inc., Woodbridge, CT 06525. Mix according to manufacturer's instructions.

2.6 MORTAR GROUT FOR POINTING

A. Mortar grout for pointing of joints shall consist of one (1) part white Portland cement, type (2) parts sand, mortar coloring additive, gauged with latex polymer additive.

1. Portland Cement: ASTM C 150, complying with the staining requirements of ASTM C91 for not more than 0.03% water soluble alkali as per ASTM C 114. Furnish Type I, except Type III may be used for cold-weather construction.

2. Color pigment shall not exceed 10% of the Portland cement in the mortar.
3. Latex polymer additive shall be equal to "Laticrete 3701", manufactured by Laticrete International, Inc., Woodbridge, CT 06525. Mix according to manufacturer's instructions.
4. Except as otherwise indicated, all other mortar grout materials shall be as specified in Paragraph 2.04 above.

B. Mortar Grout shall contain a coloring additive. Color shall be approved by the University Representative.
   1. Coloring additive shall be equal to SGS Colors, manufactured by Solomon Grind Chem Service, Springfield, IL 62705.
   2. Mortar coloring additive shall have mineral oxide pigment and shall be certified by the supplier to be resistant to alkali, light, and weather, and shall be of a chemical composition unaffected by cement and free of water and soluble salts.
   3. Color pigment in grout mixture shall not exceed 10% of the Portland cement content.
   4. Color shall match color of stone.

C. Water: Potable.

2.7 VENEER ANCHORS

A. Adjustable Veneer Anchors: 2-piece assemblies that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to wall, for attachment of Veneer Stone to CMU Block and that are capable of withstanding a 100-lbf load in both tension and compression without deforming or developing play in excess of 0.05 inch. Space anchors at 16” on center vertically.

   1. Screw-Attached Veneer Anchors: Units with triangular wire tie and rib-stiffened, sheet metal anchor section with screw holes top and bottom and with raised rib-stiffened strap stamped into center to provide a slot for connection of wire tie.

      a. Products: Dur-O-Wal, a Dayton Superior Company; D/A 213.

2.8 MASONRY CLEANERS

A. Job-Mixed Detergent Solution: Solution of 1/2-cup dry-measure tetrasodium polyphosphate and 1/2-cup dry-measure laundry detergent dissolved in 1 gal. of water.

2.9 THROUGH WALL FLASHING

A. Provide metal flashing as per Section 04 2113.

   1. Install flashing directly below top of the stone coping, and extend beyond face of wall concealing the flashing under the 1” stone coping overhang. Extend at corners in both directions bending coping down the shed water away for wall.
PART 3 - EXECUTION

3.1 SETTING OF STONE VENEER, GENERAL

A. Perform necessary field cutting, as stone is set, using power saws to cut stone. Trim and cut stone so that edges are dressed.

B. Arrange and trim stones for accurate fit in range horizontal Ashlar pattern with course heights as indicated, random lengths, and uniform joint widths, with offset between vertical joints as indicated.

C. Maintain uniform joint widths except for variations due to different stone sizes and where minor variations are required to maintain bond alignment, if any. Lay walls with joints not less than 3/8 inch at narrowest points, and not more than 5/8 inch at widest points.

3.2 CONSTRUCTION TOLERANCES

A. Variation from Plumb: For vertical lines and surfaces, do not exceed 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch in 40 feet or more. For external corners, expansion joints, control joints, and other conspicuous lines, do not exceed 1/4 inch in 20 feet or 1/2 inch in 40 feet or more.

B. Variation from Level: For lines of exposed lintels, sills, parapets, horizontal grooves, and other conspicuous lines, do not exceed 1/4 inch in 20 feet or 1/2 inch in 40 feet or more.

C. Variation of Curved Wall Line: For position shown in plan, do not exceed 1/2 inch in 20 feet or 3/4 inch in 40 feet or more.

3.3 INSTALLATION OF ANCHORED STONE VENEER ASSEMBLIES

A. Anchor stone veneer to concrete with corrugated-metal veneer anchors as follows:
   1. Embed veneer anchors in mortar joints to within 1 inch of face.

B. Space veneer anchors not more than 16 inches o.c. vertically and 32 inches o.c. horizontally, with not less than 1 veneer anchor per 2.67 sq. ft. of wall area. Install additional veneer anchors within 12 inches of openings, sealant joints, and perimeter at intervals not exceeding 12 inches.

C. Set stone in full bed of mortar with full head joints, unless otherwise indicated. Build veneer anchors into mortar joints, as stone is set.
   1. Install continuous wire reinforcement in horizontal joints indicated and attach to seismic veneer anchors, as stone is set.

D. Fill collar joint with mortar as stone is set.

E. Mortar joints for pointing with mortar to depth of not less than 1 inch. Rake joints uniformly.

F. Install stainless steel setting pins on stone copings as required, see Section 04 4300 for
3.4 ADJUSTING AND CLEANING

A. In-Progress Cleaning: Clean stone veneer assemblies as work progresses. Remove mortar fins and smears before tooling joints.

B. Final Cleaning: After mortar is thoroughly set and cured, clean stone veneer assemblies as follows:

1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
2. Test cleaning methods on mockup; leave one-half of panel un-cleaned for comparison purposes.
3. Protect adjacent stone and non-masonry surfaces from contact with cleaner.
4. Wet wall surfaces with water before applying cleaner; remove cleaner promptly by rinsing thoroughly with clear water.
5. Clean stone veneer assemblies by bucket and brush hand-cleaning method described in BIA Technical Note No. 20 Revised II, using job-mixed detergent solution.
6. Clean stone veneer assemblies with proprietary acidic cleaner applied according to manufacturer's written instructions.

3.5 EXCESS MATERIALS AND WASTE

A. Disposal as Fill Material: Dispose of clean masonry waste, including mortar and excess or soil-contaminated sand, from all areas and dispose of off-site.

1. Do not dispose any masonry waste materials on site or within soil or planting beds.

END OF SECTION 04 4310
SECTION 05 12 00 - STRUCTURAL STEEL

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

A. Work of this section, as shown or specified, shall be in accordance with the requirements of the Contract Documents.

1.02 WORK INCLUDED

A. Work of this section includes all labor, materials, equipment and services necessary to complete the structural steel work as shown on the drawings and specified herein, including, but not limited to the following:

1. Furnish and deliver for installation by others, anchor bolts, bearing plates and loose lintels with complete instructions and templates to facilitate installation.
2. Furnish and erect all struts, columns, bearing plates, beams, girders, bracing, hangers, and all related connections (bolted and welded).
3. Openings (unreinforced and reinforced) in structural steel to accommodate mechanical and electrical work.
4. Shop painting and field touch-up painting.
5. Erection bracing and supports, including steel wedges, shims or nuts required for leveling base plates.
6. Brick shelves and angles attached to structural steel as shown on drawings.
7. Unless specifically excluded, furnish and install all other items for structural steel work indicated on the drawings, specified, or obviously needed to make the work of this Section complete.

1.03 RELATED WORK SPECIFIED ELSEWHERE

A. Installation of anchor bolts furnished under this section.
B. Grout under base and bearing plates.
C. Installation of loose lintels furnished under this section
D. Metal decking.
E. Miscellaneous metal work.
F. Painting and finishing for shop and field painting of structural steel, except as specified herein.
G. Fireproofing systems.

1.04 QUALITY ASSURANCE

A. Codes and Standards: Comply with the applicable provisions and recommendations of the following codes and standards except where more stringent requirements are
shown or specified:

1. Governing Building Codes having jurisdiction over the project. AISC "Specification for Structural Steel Buildings".

2. AISC "Code of Standard Practice for Steel Buildings and Bridges" (paragraph 4.2.1 of the above code is hereby modified by deletion of the following sentence: "This approval constitutes the owner's acceptance of all responsibility for the design adequacy of any connections designed by the fabricator as a part of his preparation of these shop drawings.")

5. AISC "Specifications for Structural Joints Using ASTM A325 or A490 Bolts."

6. ASTM A6 "General requirements for rolled steel plates, shapes, sheet piling and bars for structural use."

7. AWS D1.1, "Structural Welding Code."

8. SSPC "Steel Structures Painting Manual, Volume 2, Systems and Specifications."

B. Qualifications for welding work shall be as follows:

1. Qualify welding procedures and welding operators in accordance with the AWS "Standard Qualification Procedure."

2. Submit certification that all welders to be employed in work are AWS qualified. If re-certification of welders is required, re-testing will be responsibility of structural steel subcontractor.

C. Fabricator Qualifications:

1. Company specializing in structural steel fabrication having a minimum of 5 years successful, documented experience with work comparable to that required for this project.

2. Maintain full-time engineering department.

3. Participant in AISC Quality Certification Program, designated as a Category I Conventional Steel Structures Certified Plant.

1.05 SUBMITTALS

A. Submit shop drawings in accordance with the specifications as follows:

1. Show clearly all work, including relationship of structural steel to the adjacent work of other trades and to significant lines of finishes of other trades. Submit proposed sequencing and erection procedures for review. Submission shall indicate all requirements necessary to accommodate prescribed dead load deflections (camber).

2. Fabrication and erection drawings that are submitted in separate packages for erection sequencing shall be submitted in complete packages. These packages shall include piece, detail and erection sheets for all
elements in that sequence, including but not limited to beams, columns and slab edge elements. All connections between elements shall be detailed. Connection locations for members in other sequences shall be clouded and/or labeled to indicate that it is part of a future sequence. Reviewed members that have connections from elements in other sequences must be resubmitted with new sequences to verify coordination and changes to the previously submitted element. Partial submittals or submittals without the required information will be returned without review.

3. Do not fabricate or deliver work to the site before drawings reviewed by the architect have been returned.

4. Prepare shop drawings in conformance with the best standards of the construction industry, and not less complete than indicated by the applicable procedures shown in "Structural Steel Detailing," Latest Edition, published by AISC. Prepare shop drawings under the supervision of a registered professional engineer, licensed by the state in which the construction is to take place. During the preparation of shop drawings, and prior to submittal, coordinate and cross check all shop drawings, including those prepared by subcontractors, for compliance with the Contract Documents. Each shop drawing shall bear the seal and signature of the engineer in charge of structural steelwork for the steelwork subcontractor, and the initials of the individual actually preparing the drawing.

5. Indicate clearly the size and grade of steel for each component. Identify rolled shapes, tubes and plates by using the standard designations used in "Manual of Steel Construction," Latest Edition, by AISC.

6. Indicate welds and nondestructive tests by using the symbols conforming to AWS A2.4 "Symbols for Welding and Nondestructive Testing." Where necessary for clarity, indicate welding procedure designations or other data in the tail of the welding symbol.

7. Show explicitly the type of connection used in each location, the grade, size, and number of bolts; the type, number, position, designation and orientation of each washer; and the size of each hole, whether slotted or round. Ensure that adequate wrench clearance for correct bolt tightening is provided and note special bolt tightening sequences where applicable and necessary.

8. Show all camber dimensions in the shop drawings. Where specific camber is not shown in the drawings, note on each affected shop drawing that such members are to be fabricated with the natural camber up.

9. Show holes required for securing work specified in other sections to structural steelwork, as well as all holes required for passage through structural steelwork of work by other trades. Provide field work drawings for all such holes not shown in shop or erection drawings. Addition of, or change in size or location of openings will not be permitted without prior approval in writing.

10. Make details in such a way as to avoid having steel, connections, bracing, bolts, etc., interfere with architectural details or in any way reduce the areas of shafts, openings, clearances, etc.

11. Detail and schedule cleaning and painting data and requirements, including specific indication of "no-paint" areas.

12. Prepare original shop drawings. The use of the engineer's or architect's drawings as a base for photographic or other reproduction for shop drawings or details will not be permitted. Show clearly the size and location of each
member and the erection mark assigned to each member. Show each field connection with all data and details necessary for assembling the structure. Direct special attention to the possible need for special guying, bracing, or shoring to prevent deformation of existing or new structure due to stresses caused by erection procedures and equipment, by construction loadings, and by forces of natural phenomena.

13. Prepare, keep up-to-date, and submit a complete drawing index cross-referencing each assigned piece mark with the drawing number in which the piece is detailed. Detail drawings submitted without an up-to-date index and the applicable erection drawing(s) showing the location of each piece will be deemed an incomplete submission and will not be accepted as subject to any agreed shop drawing review schedule.

14. Prepare anchor bolt and base plate erection drawings containing complete location and placing details, including details of all templates. Provide anchor bolt erection drawings to the concrete trade in advance of applicable concrete work and in coordination with concrete construction sequence.

15. Direct the architect’s attention in writing to any proposed deviations from the Contract Documents, prior to the submission of shop drawings showing the proposed deviation. Submit requests for deviations on the steelwork subcontractor’s letterhead. Deviations not identified, or identified only in letters of transmittal or in shop drawings or both, without the required written request, may not be accepted, and shall be sufficient cause for the architect to return each shop drawing containing such deviations without further action. Acceptance of shop drawings containing deviations not detected by the architect during shop drawing review shall not relieve the steelwork subcontractor from responsibility to conform strictly to the Contract Documents.

16. Prior to resubmission of shop drawings with additions or corrections, circle and identify all changes. Drawings submitted without each change being clearly identified are subject to return for resubmission.

17. Prior to making shop drawings for any portion of the work involving alterations to an existing structure, make all necessary field observations, measurements and surveys of existing conditions. If probes are required to accomplish such measurements, give timely notice where probes will be required.

B. Submit certified copies of each survey conducted by a surveyor licensed by the state in which the construction is to take place and employed by the structural steel subcontractor. Survey shall show elevations and locations of base plates and anchor bolts to receive structural steel, and final elevations and locations for major members. Indicate discrepancies between actual installation and Contract Documents.

C. Reports:

1. Submit three certified mill test reports of chemical analysis and physical test for:
   a. Structural Steel
   b. Bolts, nuts, and washers
   c. Direct tension indicators
d. Shear stud connectors

e. Shop primer

f. Non-shrink grout

2. Submit anchor bolt checking certification as required.
3. Submit qualification certificates of all welders who will perform work on the project.

D. Calculations: For connections required by the Contract Documents to be selected or completed by the fabricator, provide engineering calculations prepared and sealed by a Registered Professional Engineer, licensed in the by the state in which the construction is to take place. Submit fabricator’s job standards and accompanying calculation prior to submission of steel shop drawings.

E. Certificates: Submit certification that materials to receive polyurethane coating system have received compatible surface preparation and priming.

F. LEED Submittals:
1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of post-consumer and pre-consumer recycled content.
   a. Include statement indicating costs for each product having recycled content.
2. Credit MR 5.1: List of proposed regionally manufactured materials and regionally extracted, harvested, or recovered materials.
   a. Identify each regionally manufactured material, its source, and cost.
   b. Identify each regionally extracted, harvested, or recovered material, its source, and cost.
   c. Include statement confirming the following, and identifying the nearest town for each indicated location.
      1) Distance between location of manufacture and Project site.
      2) Distance between location of extraction, harvesting, or recovery, and Project site.

1.06 DELIVERY, STORAGE AND HANDLING

A. Deliver materials to site at such intervals to ensure uninterrupted progress of work.

B. Deliver anchor bolts and anchorage devices with accompanying templates, which are to be embedded in cast-in-place concrete, in ample time not to delay work.

C. Store materials to permit easy access for inspection and identification. Keep steel members off ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.

D. Do not store materials on structure in a manner that might cause distortion or damage to members of supporting structures. Repair or replace damaged materials or structures as directed.

1.07 TESTING AND INSPECTION
A. Inspection of all structural steelwork in the shop and field will be performed by an inspection agency retained by the Owner. The inspection agency shall work under the direction of the architect. The Owner shall provide the inspection agency with the following:

1. Schedule of all work in both shop and field with at least ten days written notice before commencement of either activity.
2. A complete set of approved shop and erection drawings.
3. Cutting lists, order sheets, material bills, shipping bills and mill test reports.
4. Information as to time and place of all rollings and shipment of material to shops.
5. Representative sample pieces as requested by the testing agency.
6. Full and ample means and assistance for testing all material.
7. Proper facilities, including scaffolding, temporary work platforms, etc., for inspection of the work in the mills, shop and field.

B. Each person installing connections shall be assigned an identifying symbol or mark and all shop and field connections shall be so identified so that the inspector can refer back to the person making the connection.

C. The following minimum criteria shall be adhered to in testing of welds and bolts:

1. All welds and bolts shall be examined by visual means.
2. 25% of all welds, selected randomly, shall be measured.
3. 25% of all pretensioned bolts, selected randomly, shall be checked with calibrated torque wrench.
4. In addition, all welds subject to tensile stress shall be examined by the Ultrasonic Method for 100% of their length.
5. 10% of all manual fillet welds shall be tested by the magnetic particle method.
6. 12-inches at each end of automatic fillet welds shall be tested by the magnetic particle method.
7. 100% of groove welds shall be tested by the ultrasonic method.

D. Shop inspection will include examination of steel for straightness and alignment, fissures, mill scale, and other defects and deformities, as described in ASTM A6, examination of fabricated pieces for conforming with approved shop drawings, testing of bolts and welds, and inspection of shop painting. All shop welds shall be visually inspected and spot tested using Ultrasonic Method ASTM E-114 and AWS, Chapter 6, Part C. All inspected welds shall be identified by the inspector.

E. Field inspection will include examination of erected steel for welding, proper fitting and tensioning of bolts, alignment, trueness and plumbness, touching-up of shop coat and level of base plates.

F. Inspection of welding will be such as to assure that the work is within the quality requirements specified below and elsewhere in this section of the specifications and will include:
1. Ascertainment that the electrodes used for manual shielded metal-arc welding and the electrodes and flux used for submerged arc-welding conform to the requirements of this section of the specifications.

2. Ascertainment that the approved welding procedures and sequence are followed without deviation, unless specific approval for change is obtained from the architect.

3. The testing agency shall be prepared to utilize the following approved methods of testing:

   a) Liquid penetrant inspection: ASTM E-165.
   c) Radiographic inspection: ASTM E-94, E-142, and E1032.
   d) Ultrasonic inspection: ASTM E-114 and AWS, Chapter 6, Section C.

G. When defects are revealed, additional inspection by whatever method is deemed necessary by the inspector, shall be performed to the extent necessary to assure that the full amount of defect has been located. No further work shall be done on the assembly or sub-assembly in question until all the necessary corrections have been made. Defects shall be repaired, using the same welding procedure that was used initially in making the weld, unless otherwise approved by the architect. Inspection of the repaired weld shall be by the same method that was used to reveal the defect. A second repair of a defective area shall not be made without approval of the architect.

H. Apparatus and procedure for measuring torque and tension in high strength bolts and for calibrating wrenches shall be furnished and maintained by steel contractor, and shall be approved by the inspection agency. Wrenches shall be calibrated each day of the beginning of the work, each time the bolt size or length of pressure hose is changed, and at such other times as the inspection agency may direct. Periodic checks of high strength steel bolt connections will be made in the field by the inspection agency. The steel contractor shall maintain at all times during erection a manual torque wrench, and shall provide a laborer and scaffolding as required for the testing of connections by the inspection agency, and shall at his own expense, furnish such facilities and provide such assistance as may be required for proper inspection.

I. A distinguishing mark will be placed on all work that has been inspected and approved. Material or work that is not acceptable will be designated by words such as "REJECT" or "REPAIR" marked directly on the material or work.

J. Inspection of Shop Painting:

1. Visually evaluate surface preparation by comparison with pictorial standards in accordance with SSPC-Vis 1.

2. Measure dry film thickness of each coat with a magnetic film thickness gauge in accordance with SSPC-PA 2.

3. Visually inspect dried film for runs, sags, dry spray, overspray and missed areas.

4. Repair defective or damaged areas in accordance with painting...
requirements specified. Architecturally exposed structural steel shall be free of runs and holidays. Make repairs to shop or field coat as directed.

1.08 COORDINATION REQUIREMENTS

A. The structural steel contractor shall coordinate the structural steel work with the work of other Contracts. Verify all dimensions and details of this Contract and those of other Contracts that affect the work before proceeding. Any discrepancies shall be immediately reported to the architect.

B. Be fully responsible for the accurate installation of the work. Any discrepancy which arises from his failure to execute the work in conformity to the drawings and specifications shall be properly remedied at the contractor’s own expense and in a manner acceptable to the architect.

C. Locate dimensionally on setting plans all anchor bolts, inserts, bearing and base plates, etc., and prepare and deliver all required templates and fully dimensioned setting plans in time for the proper execution of the work. Anchor bolts shall be set by another subcontractor. The structural steel contractor shall check all such settings for correctness after they have been cast in place, and before proceeding with erection work.

D. Report to the architect and certify compliance with the above checking requirements in writing and indicate any inaccuracies found in the location of anchor bolts or inserts, and corrections which must be made to their installation. Any inaccuracies not included in the report and found during or after steel erection shall be the responsibility of the structural steel contractor and the cost of corrective measures shall be borne by him.

E. Use base lines, bench marks, or other standards for survey work that have been provided or verified by others. If permanent building bench marks have been established, these will be used for field checking.

F. The structural steel subcontractor shall be fully responsible for all means, methods, techniques, sequences and procedures of construction. Coordinate with all other trades to insure that work of this section does not cause undue conflict. Insure that location of erection devices such as cranes, derricks, booms or hoists, does not cause overstresses to steel frame, to work previously placed by other trades or to existing structures. When required, retain the services of a professional engineer to ascertain that erection devices do not create unsafe conditions or cause overstresses.

1.09 SUBSTITUTION

A. Architect reserves the right to require substitute shapes of other sizes than those indicated on the drawings when it is apparent that the shapes specified cannot be furnished within the time required for the progress of construction. Make said substitutions without additional cost to the owner.

PART 2 - PRODUCTS
2.01 MATERIALS

A. Structural steel wide flange columns, girders, beams, and diagonal bracing: ASTM A992, or ASTM A572, Grade 50.

B. Miscellaneous steel shapes, plates, stiffeners, and base plates: ASTM A36.

C. Anchor Bolts: ASTM F1554, Grade 55.

D. Pipe Sections: ASTM A501 or ASTM A53, Grade B.

E. Structural Tube (HSS-Hollow Structural Sections): ASTM A500, Grade B.

F. Stainless Steel Hanger Rods and Connection Plates: ASTM A564 Type 17-4PH with a minimum yield strength of 50 ksi.

G. High Strength Bolts: ASTM A325 “bearing-type”, with hardened washers. Provide mechanically galvanized bolts, nuts, washers, and shims at connections exposed to weather and at members supporting exterior masonry. Nuts and bolts at tension element connection to structure shall conform to ASTM A307, A325 and shall be the regular hexagon-bolt type, or as shown in the drawings. Round washers shall conform to American Standard B 27.2 type b. Washers in contact with high-strength bolt heads and nuts shall be hardened in accordance with ASTM Standard A325. Beveled washers shall be square, smooth and sloped so that contact surfaces with the bolt head and nut are parallel. The diameter of the hole of square-beveled washers shall be 1/16 inch greater than the bolt size for bolts smaller than one inch, and shall be 1/8 inch greater than the bolt size for bolts larger than one inch.

G. Unfinished Bolts: ASTM A307, with hexagonal heads and nuts.

H. Filler metal for welding electrodes: AWS Class E70 Series.

I. Structural steel primer paint: rust inhibitive primer conforming to TT-P-86, Type I; or Tnemec Exterior #10-99 or 88-555.

J. Headed Stud Shear Connectors: Equivalent to S3L by Nelson.

K. Direct Tension Indicators: ASTM F959, Type 325.

L. Welding Materials: AWS D1.1, type required for materials being welded.

M. Thermal Break: Koralath Shim – Engineered multi-polymer plastic to be used as a bearing material, a dielectric between dissimilar metals, strips, shims, spacers and accessories as noted in the Drawings

   a. Minimum Compressive Strength: 9000 psi.

N. Primer for Polyurethane Coating System: Zinc-rich primer complying with SSPC-Paint 20 or SSPC-Paint 29 and compatible with topcoat. Use primer with VOC
content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

1. Acceptable products and manufacturers:
   a. Carbozinc 11 VOC by Carboline Company.
   c. 90-97 Tneme-Zinc by Tnemec Company, Inc.

PART 3 - EXECUTION

3.01 FABRICATION

A. All shop connections shall be welded or high strength bolted unless specifically shown otherwise. Fabricate work in shop in as large assemblies as practicable.

B. Camber: All beams, girders (except cantilevers) and other members shall be fabricated with natural camber up.

C. Mill column ends and bearing stiffeners to give full bearing over the cross section. Plane contact surfaces of bearing plates when required by the AISC Specifications. It is not necessary to plane bottom surfaces of plates on grout beds.

D. Drill or punch holes at right angles to the surface of the metal, not more than 1/16" larger than the connector diameter. Do not make or enlarge holes by burning. Drill material having a thickness in excess of the connector diameter and material thicker than 7/8". Holes shall be clean-cut without torn or ragged edges. Remove outside burrs resulting from drilling operations.

E. Provide holes in members to permit connection of the work of other trades. Use suitable templates for proper location of these holes. Steel requiring adjustment or accurate alignment shall be provided with slotted holes or full bearing shims as shown.

F. Provide holes, slots and openings required by other trades together with necessary reinforcing required. Use suitable templates for proper location of these openings. All such openings shall be shown on the shop drawings. No change in size or location will be permitted without prior approval.

G. Cutting: Cut metal by sawing, shearing or blanking. Flame cutting will be permitted only if cut edges are ground back to clean, smooth edges. Make cuts accurate, clean, sharp, square and free of burrs, without deforming adjacent surfaces or metals. Manual flame cutting shall be done only with a mechanically guided torch. An unguided torch may be used provided the cut is within 1/8" of the required line. Field burning is not permitted without written approval.

3.02 CONNECTIONS

A. Provide connections as shown on the contract drawings. Where connections are not detailed, the minimum connections shall comply with appropriate tables titled,
"Framed Beam Connections" shown in the AISC "Manual of Steel Construction" unless otherwise noted on the drawings. Use high strength bolts or welds unless otherwise shown.

B. For all composite beams, proportion and detail all connections on shop drawings to resist forces shown on design drawings. If no reactions are indicated on design drawings, design connections for non-composite beams to resist the end reaction shown in the AISC tables for Uniform Load Constants for Beams.

C. Bolting:

1. Bolts shall be of a length that will extend not less than 1/4" but not more than 1/2" beyond the nuts. Enter bolts into holes without damaging the thread.
2. Use “bearing-type” high-strength bolts as shown. Bolt heads and nuts shall rest squarely against the metal. Where structural members have sloping surface, bolted connections shall be provided with beveled washers to afford square seating or framing for bolt heads or nuts. At slip-critical connections with oversized or long-slotted holes, provide 5/16" thick plate washers completely covering holes. Bring members tightly together with sufficient high-strength "fitting-up" bolts, which shall be retightened as all the bolts are finally tightened. Manual torque wrenches will not be accepted for final tightening. Protect bolt heads from damage during placing. Final tightening of high-strength bolts shall be by properly calibrated power torque wrenches. Bolts that have been completely tightened shall be marked for identification.

D. Welding:

1. Do not begin structural welding until joint elements are inspected for surface preparation, fit-up, and cleanliness of surface to be welded and are then bolted or tacked in intimate contact and adjusted to dimensions shown on drawings, or both, with allowance for any weld shrinkage that is expected. No members are to be spliced without prior approval by the architect.
2. Pre-heat and interpass temperature shall be in accordance with Table 4.2 (including footnotes) of the AWS Code for Welding in Building Construction. The temperature shall be measured from the side opposite to that which the pre-heat is applied, where possible.
3. All groove welds shall be continuous and full penetration welds unless otherwise shown on the design drawings. Welds made without the aid of a back-up bar shall have their roots chipped, ground or roughened out to sound metal from the second side, before welding is done from the second side.
4. All welds shall be sound throughout. There shall be no crack in any weld or weld pass. Weld may be considered sound if it contains only slight porosity or fusion defects, which are well dispersed.
5. The heat, input, length of weld and sequence of weld shall be controlled to prevent distortions. The surfaces to be welded and the filler metals to be used shall be subject to inspection before any welding is performed.

E. Connection depth: Minimum depth of shear connections shall be half the depth of the beam or girder (d/2).
G. Moment Connections: Unless design moments are provided on the contract drawings, provide bolted or welded moment connections with sufficient capacity to develop the full moment capacity of the connected member. In event that two different members are moment connected, the moment connection shall develop the full moment capacity of the weaker member.

G. Drill or punch holes at right angles to the surface of the metal, not more than 1/16 in. larger than the connector diameter. Do not make or enlarge holes by burning. Drill material having a thickness in excess of the connector diameter and material thicker than 7/8 in. Holes shall be clean-cut without torn or ragged edges. Remove outside burrs resulting from drilling operations.

H. Mill column and bearing stiffeners to give full bearing over the cross section. Mill contact surfaces of bearing and base plate. It is not necessary to plane bottom surfaces of plates on grout beds.

3.03 PAINTING AND CLEANING

A. Remove all rust, scale, grease and other detrimental foreign matter in accordance with the Steel Structures Painting Council Specification SP-3, Power Tool Cleaning.

B. Immediately after surface preparation, apply structural steel primer paint where specified, in accordance with manufacturer's instructions and at a rate to provide dry film thickness of not less that 2.0 mils. Use painting methods, which result in full coverage of joints, corners, edges and exposed surfaces. Use type of primer paint as specified in "Materials" article above. Apply two coats to surfaces that will be inaccessible after erection.

C. Paint all structural steel in accordance with the foregoing specification, except as follows:

1. Steel which is to receive spray-on fireproofing.
2. Within 2" of field welds or welds made after paint is applied.
3. Within 3" of faying surfaces of high strength slip-critical bolts.
4. Machined surfaces and threaded parts required for adjustment of the structure. Protect these with suitable rust inhibiting coating, which may be removed after final installation of the work so that proper finished coatings may be applied.
5. Surfaces to be embedded in concrete or mortar. Extend priming of partially embedded members to depth of 2 inches.
6. Provide second coat of paint on all steel in unheated spaces, but not directly exposed to moisture.

D. Field Painting:

1. After erection, all damaged areas in shop coat, exposed surfaces of bolt heads, nuts and washers, and all field welds and unpainted areas adjacent to field welds and high strength bolts shall be painted with a "touch-up" application of same paint used in the shop coat and then painted with same
paint used for shop coat tinted another color. Retouch in field, any scraped, abraded, and unpainted surfaces. Painting shall be as specified for shop coats.

2. Structural steel which is to support mechanical equipment that is exposed to the weather shall be hot-dip galvanized. This application shall be the responsibility of the structural steel subcontractor. Touch up all heat affected or damaged coatings with zinc-rich paint.

E. Shop Priming for Polyurethane Coating System:

1. Shop prime items with primer for polyurethane coating system.
2. Preparation: Clean by SSPC-SP 1-63 "Solvent Cleaning" method, followed by SSPC-SP 6-63 "Commercial Blast Cleaning" method to remove loose mill scale and rust.
3. Apply prime coat as soon as possible after cleaning. Provide smooth, uniform dry film thickness of 2.5 to 3.5 mils, unless otherwise recommended by finish coat manufacturer.
4. Locations: Use for steel exposed to weather and at mansard roof framing

3.04 ERECTION

A. Verify field measurements prior to start of erection. Check the alignment and elevation of all column supports and location of all anchor bolts with transit and level instruments before starting erection. Notify architect of any errors. Obtain architect’s approval of methods proposed for correcting errors prior to proceeding with corrections and erection.

B. Bearing and column base plates shall be supported and aligned on steel wedges, shims, or leveling nuts. After the supported members have been plumbed and properly positioned by instrument and anchor nuts tightened, the entire bearing area under the plate shall be packed solidly with grout specified in the Cast-in-Place Concrete Section. Wedges and shims shall be set back a minimum of 3/4” from the edges of plates and shall be left in place. Leveling plates are not permitted for column base plates larger than 24” in dimension.

C. Plumbing, Leveling and Bracing:

1. Structural steel shall be erected true and level, and temporary bracing shall be introduced wherever necessary to provide for all loads to which the structure may be subjected, including equipment and the operation thereof. Such bracing shall be left in place as long as may be required for safety. No welding shall be done or bolts drawn up tight until structural steel has been properly aligned. Obtain approval for guy locations to assure lack of interference with operations of other trades.

D. Drifting:

1. Light drifting necessary to draw holes together will be permitted, but drifting of
unfair holes will not be permitted. Twist drills shall be used to enlarge holes as necessary to the next larger size; use next larger size bolts as required. Reaming that weakens the members, or makes it impossible to fill the holes properly or to adjust accurately after reaming, will not be allowed.

END OF SECTION 05120
SECTION 05 12 13 - ARCHITECTURALLY EXPOSED STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes architecturally exposed structural-steel framing.
1. Requirements in Division 05 Section "Structural Steel Framing" also apply to AESS framing.
2. Requirements in Division 05 Section "Metal Stairs" also apply to AESS framing at the Monumental Stair C.

B. Related Sections:
1. Division 01 Section "Quality Requirements" for independent testing agency procedures and administrative requirements.
2. Division 05 Section "Structural Steel Framing" for additional requirements applicable to AESS.
3. Division 05 Section "Structural Steel Framing" for the requirements for steel which is exposed in finished construction but which is not designated as "AESS."
4. Division 05 Section "Metal Fabrications" for steel lintels and shelf angles not attached to structural-steel frame, miscellaneous steel fabrications, and other metal items not defined as structural steel.
5. Division 05 Section "Metal Stairs" for additional requirements applicable to AESS stair fabrications.
6. Division 09 Section “Painting” for surface preparation and priming requirements, especially High Performance primers and paints for AESS steel.

1.3 DEFINITIONS

A. Architecturally Exposed Structural Steel: Structural steel designated as "architecturally exposed structural steel" or "AESS" in the Contract Documents, including, but not limited to the following:
1. Steel for the Monumental Stair designated as Stair C.
2. Pipe columns in the Lecture Hall, to receive High Performance finish.
3. Steel plate walls in Lecture Hall, to receive High Performance finish.
4. Steel plate ceiling panels and trim and structure (plate columns and wide flange beams) in Vestibule F105, to receive High Performance finish.
5. All other steel designated “AESS” on structural and architectural drawings and general notes.

1.4 ACTION SUBMITTALS

A. Shop Drawings: Show fabrication of AESS components. Shop Drawings for structural steel may be used for AESS provided items of AESS are specifically identified and requirements below are met for AESS.
1. Clearly identify all AESS members and note special quality, tolerance, surface preparation and painting requirements.
2. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
3. Include embedment drawings.
4. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Show backing bars that are to be removed and supplemental fillet welds where backing bars are to remain. Indicate grinding, finish, and profile of welds.
5. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical high-strength bolted connections. Indicate orientation of bolt heads.
6. Indicate exposed surfaces and edges and surface preparation being used.
7. Indicate special tolerances and erection requirements.

B. Samples: Submit samples of AESS to set quality standards for exposed welds.
   1. Two steel plates, 3/8 by 8 by 4 inches (9.5 by 200 by 100 mm), with long edges joined by a groove weld and with weld ground smooth.
   2. Steel plate, 3/8 by 8 by 8 inches (9.5 by 200 by 200 mm), with one end of a short length of channel, in size typical for this project, welded to plate with a continuous fillet weld and with weld ground smooth and blended.

1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified fabricator.

1.6 QUALITY ASSURANCE
A. Fabricator Qualifications: A qualified fabricator who participates in the AISC Quality Certification Program and is designated an AISC-Certified Erector, Category STD.

B. Shop-Painting Applicators: Qualified according to AISC's Sophisticated Paint Endorsement SSPC-QP 3, "Standard Procedure for Evaluating Qualifications of Shop Painting Applicators."

C. Mockups: Build mockups of AESS to set quality standards for fabrication and installation.
   1. Build mockup of portion of Stair C and steel plate wall in Lecture Hall as directed by Architect.
   2. Coordinate finish painting requirements with Division 09 painting Sections.
   3. Maintain mockups as a reference standard until the conclusion of construction.
   4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

D. Preinstallation Conference: Conduct conference at Project site.

1.7 DELIVERY, STORAGE, AND HANDLING
A. Use special care in handling to prevent twisting, warping, nicking, and other damage. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from corrosion and deterioration.
   1. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.

1.8 PROJECT CONDITIONS
A. Field Measurements: Where AESS is indicated to fit against other construction, verify actual dimensions by field measurements before fabrication.

1.9 COORDINATION
A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' recommendations to ensure that shop primers and topcoats are compatible with one another.
PART 2 - PRODUCTS

2.1 BOLTS, CONNECTORS, AND ANCHORS

A. Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F 1852, Type 1, round-head assemblies, consisting of steel structural bolts with splined ends, heavy-hex carbon-steel nuts, and hardened carbon-steel washers.
1. Finish: Plain or Mechanically deposited zinc coating.

2.2 PRIMER

A. Primer: Comply with Division 09 painting Sections.

2.3 FABRICATION

A. Shop fabricate and assemble AESS to the maximum extent possible. Locate field joints at concealed locations if possible. Detail assemblies to minimize handling and to expedite erection.

B. In addition to special care used to handle and fabricate AESS, comply with the following:
1. Fabricate with exposed surfaces smooth, square, and free of surface blemishes including pitting, rust, scale, and roughness.
2. Grind sheared, punched, and flame-cut edges of AESS to remove burrs and provide smooth surfaces and edges.
3. Fabricate AESS with exposed surfaces free of mill marks, including rolled trade names and stamped or raised identification.
4. Fabricate AESS with exposed surfaces free of seams to maximum extent possible.
5. Remove blemishes by filling or grinding or by welding and grinding, before cleaning, treating, and shop priming.
6. Fabricate with piece marks fully hidden in the completed structure or made with media that permits full removal after erection.
7. Fabricate AESS to the tolerances specified in AISC 303 for steel that is designated AESS.
8. Fabricate AESS to the tolerances specified in AISC 303 for steel that is not designated AESS.
9. Seal-weld open ends of hollow structural sections with 3/8-inch (9.5-mm) closure plates for AESS.

C. Curved Members: Fabricate indicated members to curved shape by rolling to final shape in fabrication shop.
1. Distortion of webs, stems, outstanding flanges, and legs of angles shall not be visible from a distance of 20 feet (6 m) under any lighting conditions.
2. Tolerances for walls of hollow steel sections after rolling shall be approximately 1/2 inch (13 mm).

D. Coping, Blocking, and Joint Gaps: Maintain uniform gaps of 1/8 inch (3.2 mm) with a tolerance of 1/32 inch (0.8 mm) for AESS.

E. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces.

F. Holes: Provide holes required for securing other work to structural steel and for other work to pass through steel framing members.
1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
2. Baseplate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
3. Weld threaded nuts to framing and other specialty items indicated to receive other work.
2.4 SHOP CONNECTIONS

A. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
   1. Joint Type: Snug tightened unless otherwise indicated as Slip critical.

B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work, and comply with the following:
   1. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding specified tolerances.
   2. Use weld sizes, fabrication sequence, and equipment for AESS that limit distortions to allowable tolerances.
   3. Provide continuous, sealed welds at angle to gusset-plate connections and similar locations where AESS is exposed to weather.
   4. Provide continuous welds of uniform size and profile where AESS is welded.
   5. Grind butt and groove welds flush to adjacent surfaces within tolerance of plus 1/16 inch, minus 0 inch (plus 1.5 mm, minus 0 mm) for AESS.
   6. Remove backing bars or runoff tabs; back-gouge and grind steel smooth for AESS.
   7. At locations where welding on the far side of an exposed connection of AESS occurs, grind distortions and marking of the steel to a smooth profile aligned with adjacent material.
   8. Make fillet welds for AESS oversize and grind to uniform profile with smooth face and transition.

2.5 SHOP PRIMING

A. Shop prime steel surfaces except the following:
   1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches (50 mm).
   2. Surfaces to be field welded.
   3. Surfaces to be high-strength bolted with slip-critical connections.
   4. Surfaces to receive sprayed fire-resistive materials.
   5. Galvanized surfaces.

B. Surface Preparation for Steel: Clean surfaces to be painted. Remove loose rust and mill scale and spatter, slag, or flux deposits. Prepare surfaces according to the following specifications and standards:
   1. SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."

C. Priming: Immediately after surface preparation, apply primer according to manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils (0.038 mm). Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
   1. Stripe paint corners, crevices, bolts, welds, and sharp edges.
   2. Apply two coats of shop paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify, with steel erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.
   1. Prepare a certified survey of bearing surfaces, anchor rods, bearing plates, and other embedments showing dimensions, locations, angles, and elevations.

B. Examine AESS for twists, kinks, warping, gouges, and other imperfections before erecting.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Provide temporary shores, guys, braces, and other supports during erection to keep AESS secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place unless otherwise indicated.
   1. If possible, locate welded tabs for attaching temporary bracing and safety cabling where they will be concealed from view in the completed Work.

3.3 ERECTION

A. Set AESS accurately in locations and to elevations indicated and according to AISC 303 and AISC 360.
   1. Erect Category 1 AESS to the tolerances specified in AISC 303 for steel that is designated AESS.
   2. Erect Category 2 and Category 3 AESS to the tolerances specified in AISC 303 for steel that is not designated AESS.

B. Do not use thermal cutting during erection.

3.4 FIELD CONNECTIONS

A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
   1. Joint Type: Snug tightened unless otherwise indicated Slip critical.
   2. Orient bolt heads as indicated on Drawings or in same direction for each connection and to maximum extent possible in same direction for similar connections.

   1. Remove backing bars or runoff tabs; back-gouge and grind steel smooth for Category 1 and Category 2 AESS.
   2. Remove erection bolts in Category 1 and Category 2 AESS, fill holes, and grind smooth.
   3. Fill weld access holes in Category 1 and Category 2 AESS and grind smooth.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified independent testing and inspecting agency to inspect AESS as specified in Division 05 Section "Structural Steel Framing." The testing agency will not be responsible for enforcing requirements relating to aesthetic effect.

B. Architect will observe AESS in place to determine acceptability relating to aesthetic effect.

3.6 REPAIRS AND PROTECTION

A. Remove welded tabs that were used for attaching temporary bracing and safety cabling and that are exposed to view in the completed Work. Grind steel smooth.

B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

C. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
1. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.

3.7 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 12 13
SECTION 05 31 00 - STEEL DECK

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. Roof deck.
   2. Composite floor deck.

1.2 SUBMITTALS

A. Product Data: For each type of deck, accessory, and product indicated.

B. Shop Drawings: Include layout and types of deck panels, anchorage details, reinforcing channels, pans, deck openings, special jointing, accessories, and attachments to other construction.

C. Product certificates.

D. Welding certificates.

E. Research/evaluation reports.

F. LEED Submittals:
   1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of post-consumer and pre-consumer recycled content.
      a. Include statement indicating costs for each product having recycled content.
   2. Credit MR 5.1: List of proposed regionally manufactured materials and regionally extracted, harvested, or recovered materials.
      a. Identify each regionally manufactured material, its source, and cost.
      b. Identify each regionally extracted, harvested, or recovered material, its source, and cost.
      c. Include statement confirming the following, and identifying the nearest town for each indicated location.
         1) Distance between location of manufacture and Project site.
         2) Distance between location of extraction, harvesting, or recovery, and Project site.

1.3 QUALITY ASSURANCE

B. Fire-Test-Response Characteristics: Where indicated, provide steel deck units identical to those steel deck units tested for fire resistance per ASTM E 119 by a testing and inspection agency acceptable to authorities having jurisdiction.
   1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another testing and inspecting agency.
   2. Steel deck units shall be identified with appropriate markings of applicable testing and inspecting agency.

C. AISI Specifications: Calculate structural characteristics of steel deck according to AISI's "Specification for the Design of Cold-Formed Steel Structural Members."

D. SDI Specifications: Comply with the Steel Deck Institute’s "Design Manual for Floor Decks and Roof Decks."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following or approved equal:
   1. BHP Steel Building Products USA Inc.
   2. Consolidated Systems, Inc.
   3. Epic Metals Corp.
   4. Marilyn Steel Products, Inc.
   6. Roof Deck, Inc.
   7. United Steel Deck, Inc.
   8. Verco Manufacturing Co.
   9. Wheeling Corrugating Co.; Div. of Wheeling-Pittsburgh Steel Corp.

2.2 ROOF DECK

A. Steel Roof Deck: Fabricate panels, without top-flange stiffening grooves, to comply with "SDI Specifications and Commentary for Steel Roof Deck," in SDI Publication No. 29.
   1. Galvanized Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 33, G90 zinc coating.
2. Deck Profile: Type B
3. Profile Depth: As indicated on drawings.
4. Design Uncoated-Steel Thickness: As shown on the drawings.

2.3 COMPOSITE FLOOR DECK

A. Composite Steel Floor Deck: Fabricate panels, with integrally embossed or raised pattern ribs and interlocking side laps, to comply with "SDI Specifications and Commentary for Composite Steel Floor Deck," in SDI Publication No. 29, the minimum section properties indicated, and the following:
1. Galvanized Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 33, zinc coated thickness of G60.
2. Profile Depth: As indicated on drawings.
3. Design Uncoated-Steel Thickness: As indicated on drawings.
4. Provide slots for piercing hanger tabs typically.
5. Provide Vent Slot Area: At deck that is located below exterior paved areas and at the roof provide vent slots or slots for piercing hangers that provide 1/2 percent open area of deck surface minimum.

2.4 ACCESSORIES

A. Accessories: Steel deck manufacturer's standard accessory materials, including mechanical fasteners, closure strips, pour stops, and closures for deck.
B. Shear Connectors: ASTM A 108, Grades 1010 through 1020 headed stud type, cold-finished carbon steel, AWS D1.1, Type B, with arc shields.
C. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install deck panels and accessories according to applicable specifications and commentary in the Steel Deck Institute’s “Manual of Construction with Steel Deck,” manufacturer's written instructions, and requirements in this Section.
B. Place deck panels on supporting frame and adjust to final position with ends accurately aligned and bearing on supporting frame before being permanently fastened. Do not stretch or contract side-lap interlocks.
C. Place deck panels flat and square and fasten to supporting frame without warp or deflection.
D. Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to decking.

E. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of decking, and support of other work.

F. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used for correcting welding work.
   1. Mechanical fasteners may be used in lieu of welding to fasten deck. Locate mechanical fasteners and install according to deck manufacturer's written instructions.

G. Roof Deck Accessories: Install ridge and valley plates, finish strips, cover plates, end closures, and reinforcing channels according to deck manufacturer's written instructions. Weld to substrate to provide a complete deck installation.

H. Shear Connectors: Weld shear connectors through deck to supporting frame according to AWS D1.1 and manufacturer's written instructions. Butt end joints of deck panels; do not overlap. Remove and discard arc shields after welding shear connectors.

I. Pour Stops and Girder Fillers: Weld steel sheet pour stops and girder fillers to supporting structure according to SDI recommendations, unless otherwise indicated.

J. Floor Deck Closures: Weld steel sheet column closures, cell closures, and Z-closures to deck, according to SDI recommendations, to provide tight-fitting closures at open ends of ribs and sides of decking. Weld cover plates at changes in direction of floor deck panels, unless otherwise indicated.

K. Repairs and Protection:
   1. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces of deck with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

3.2 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified independent testing agency to perform field quality-control testing.

B. Field welds will be subject to inspection.

C. Shear connector stud welds will be tested and inspected according to AWS D1.1.

D. Remove and replace work that does not comply with specified requirements.
E. Additional testing and inspecting, at Contractor's expense, will be performed to
determine compliance of corrected work with specified requirements.

END OF SECTION 05310
SECTION 05 40 00 - COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Exterior non-load-bearing wall framing.
   2. Interior non-load-bearing wall framing.

B. Related Sections include the following:
   1. Division 05 Section "Metal Fabrications" for masonry shelf angles and connections.
   2. Division 06 Section “Sheathing” for nailable rigid insulation and sheathing at exterior non-load-bearing wall framing.
   3. Division 09 Section "Non-Structural Metal Framing" for interior non-load-bearing, metal-stud framing and ceiling-suspension assemblies.
   4. Division 09 Section "Gypsum Board Shaft Wall Assemblies" for interior non-load-bearing, metal-stud-framed, shaft-wall assemblies.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide cold-formed metal framing capable of withstanding design loads within limits and under conditions indicated.

1. Exterior Design Loads:
   b. Wind Loads: Criteria indicated on the details and structural drawings.
   c. Seismic Loads: Criteria indicated on the details and structural drawings.

2. Interior Design Loads:
   a. Dead Loads: Weights of materials and construction and any construction hung /supported from metal stud
   b. Internal Pressure Loads: 5psf out of plane.
   c. Seismic Loads: Criteria indicated on the details and structural drawings.

3. Deflection Limits: Design framing systems to withstand design loads without deflections greater than the following:
   a. Exterior Non-Load-Bearing Framing backing up stone and brick: Horizontal deflection of 1/600 of the wall height.
   b. Interior Non-Load-Bearing Framing backing up interior brick and stone veneer: Horizontal deflection of 1/600 of the wall height.

4. Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change of 120 deg F.
5. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure as follows:
   a. Upward and downward movement of 1-1/2 inches.

B. Cold-Formed Steel Framing, General: Design according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions."
   1. Headers: Design according to AISI's "Standard for Cold-Formed Steel Framing - Header Design."
   2. Design exterior non-load-bearing wall framing to accommodate horizontal deflection without regard for contribution of sheathing materials.
   3. Design interior non-load-bearing framing to support stone and brick veneer where indicated in Drawings.

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of cold-formed metal framing product and accessory indicated.

   B. LEED Submittals:
      1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

   C. Shop Drawings: Show layout, spacings, sizes, thicknesses, and types of cold-formed metal framing; fabrication; and fastening and anchorage details, including mechanical fasteners. Show reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining work.
      1. For all cold-formed metal framing designed to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer, registered in the Commonwealth of Pennsylvania, responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

   A. Qualification Data: For professional engineer and testing agency.

   B. Welding certificates.

   C. Product Test Reports: From a qualified testing agency, unless otherwise stated, indicating that each of the following complies with requirements, based on evaluation of comprehensive tests for current products:
      1. Steel sheet.
      2. Expansion anchors.
      4. Mechanical fasteners.
      5. Vertical deflection clips.
      6. Horizontal drift deflection clips.
      7. Miscellaneous structural clips and accessories.

   D. Research/Evaluation Reports: For cold-formed metal framing.
1.6 QUALITY ASSURANCE

A. Engineering Responsibility: Preparation of Shop Drawings, design calculations, and other structural data by a qualified professional engineer.

B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of cold-formed metal framing that are similar to those indicated for this Project in material, design, and extent.

C. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM E 329 to conduct the testing indicated.

D. Product Tests: Mill certificates or data from a qualified independent testing agency indicating steel sheet complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, and metallic-coating thickness.

F. Fire-Test-Response Characteristics: Where indicated, provide cold-formed metal framing identical to that of assemblies tested for fire resistance per ASTM E 119 by a testing and inspecting agency acceptable to authorities having jurisdiction.

G. AISI Specifications and Standards: Comply with AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members" and its "Standard for Cold-Formed Steel Framing - General Provisions."
   1. Comply with AISI's "Standard for Cold-Formed Steel Framing - Header Design."

H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section "Project Management and Coordination."

I. Coordination Meeting for Stone Anchorage Systems: Prior to submission of shop drawings and other required submittals for the stone veneer, stone anchorage systems, structural steel, miscellaneous steel and cold-formed metal framing, the General Trades Contractor shall hold a coordination meeting with the steel supplier, cold-formed metal framing supplier, stone supplier, stone installer, stone anchorage system engineer retained by the stone supplier and/or installer, cold-formed metal framing engineer, masonry subcontractor, Construction Manager and Architect to review and coordinate the anchorage systems for the interior and exterior stone. The initial meeting shall cover the following:
   1. Responsibilities and extent of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   2. Coordination of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   3. Review schedule of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.
   4. Impact of work to be provided by each subcontractor, supplier and installer for the stone anchorage systems on work by other contractors, subcontractors, installers and suppliers.
   5. Determine date(s) for follow-up meetings, if required, to complete coordination of the work to be provided by each subcontractor, supplier and installer for the stone anchorage systems.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect cold-formed metal framing from corrosion, deformation, and other damage during delivery, storage, and handling.
B. Store cold-formed metal framing, protect with a waterproof covering, and ventilate to avoid condensation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering cold-formed metal framing that may be incorporated into the Work include, but are not limited to, the following:

1. Allied Studco.
2. AllSteel Products, Inc.
3. Clark Steel Framing.
4. Dale/Incor.
5. Dietrich Metal Framing; a Worthington Industries Company.
6. MarinoWare; a division of Ware Industries.
7. SCAFCO Corporation.
9. Steeler, Inc.
10. United Metal Products, Inc.

2.2 MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Steel Sheet: ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of grade and coating weight as follows:

1. Grade: ST33H.
2. Coating: G90 or equivalent.

C. Steel Sheet for Vertical Deflection Clips: ASTM A 653/A 653M, structural steel, zinc coated, of grade and coating as follows:

1. Grade: 50, Class 1 or 2.
2. Coating: G90.

2.3 EXTERIOR & INTERIOR NON-LOAD-BEARING WALL FRAMING

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0428 inch (18 gauge).

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with unstiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0428 inch, (18 gauge).

C. Vertical Deflection Clips: Manufacturer's standard head clips, capable of accommodating upward and downward vertical displacement of primary structure through positive mechanical attachment to stud web.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Dietrich Metal Framing; a Worthington Industries Company.
   b. MarinoWare, a division of Ware Industries.
   c. SCAFCO Corporation
   d. The Steel Network, Inc.

D. Single Deflection Track: Manufacturer's single, deep-leg, U-shaped steel track; unpunched, with unstiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal and lateral loads and transfer them to the primary structure, and as follows:
   1. Minimum Base-Metal Thickness: 0.0428 inch, 18 gauge.
   2. Flange Width: 1 inch plus the design gap for 1-story structures.

2.4 FRAMING ACCESSORIES

A. Fabricate steel-framing accessories from steel sheet, ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of same grade and coating weight used for framing members.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:
   1. Supplementary framing.
   2. Flat strap diagonal bracing.
   3. 1 ½ inch 16 gauge U channel bridging, 48 inches on center, unless otherwise noted.
   4. 1 ½ inch by 1 ½ inch x 16 gage clip angle supports for U channel bridging,
   5. Bracing, bridging, and solid blocking.
   7. Anchor clips.
   8. End clips.
   12. Joist hangers and end closures.
   13. Hole reinforcing plates.

2.5 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A 36/A 36M, zinc coated by hot-dip process according to ASTM A 123/A 123M.

B. Anchor Bolts: ASTM F 1554, 55 (S1), weldable, threaded carbon-steel hex-headed bolts and carbon-steel nuts; and flat, hardened-steel washers; zinc coated by hot-dip process according to ASTM A 153/A 153M, Class C.

C. Expansion Anchors: Fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 5 times design load, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.

D. Power-Actuated Anchors: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 10 times design load, as determined by testing per ASTM E 1190 conducted by a qualified independent testing agency.
E. Mechanical Fasteners: ASTM C 1513, corrosion-resistant-coated, self-drilling, self-tapping steel drill screws.

1. Head Type: Low-profile head beneath sheathing, manufacturer's standard elsewhere.

F. Welding Electrodes: Comply with AWS standards.

2.6 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: ASTM A 780.

B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, and plasticizing and water-reducing agents, complying with ASTM C 1107, with fluid consistency and 30-minute working time.

C. Shims: Load bearing, high-density multimonomer plastic, nonleaching.

D. Sealer Gaskets: Closed-cell neoprene foam, 1/4 inch thick, selected from manufacturer's standard widths to match width of bottom track or rim track members.

2.7 FABRICATION

A. Fabricate cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.

1. Fabricate framing assemblies using jigs or templates.
2. Cut framing members by sawing or shearing; do not torch cut.
3. Fasten cold-formed metal framing members by welding, screw fastening, clinch fastening, or riveting as standard with fabricator. Wire tying of framing members is not permitted.
   a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
   b. Locate mechanical fasteners and install according to Shop Drawings, with screw penetrating joined members by not less than three exposed screw threads.
4. Fasten other materials to cold-formed metal framing by welding, bolting, or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.

C. Fabrication Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:

1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
2. Squareness: Fabricate each cold-formed metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.
PART 3 - EXECUTION

3.1 EXAMINATION
A. Examine supporting substrates and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION
A. Before sprayed fire-resistive materials are applied, attach continuous angles, supplementary framing, or tracks to structural members indicated to receive sprayed fire-resistive materials.
B. After applying sprayed fire-resistive materials, remove only as much of these materials as needed to complete installation of cold-formed framing without reducing thickness of fire-resistive materials below that are required to obtain fire-resistance rating indicated. Protect remaining fire-resistive materials from damage.
C. Install load bearing shims or grout between the underside of wall bottom track or rim track and the top of foundation wall or slab at stud or joist locations to ensure a uniform bearing surface on supporting concrete or masonry construction.
D. Install sealer gaskets to isolate the underside of wall bottom track or rim track and the top of foundation wall or slab at stud or joist locations.

3.3 INSTALLATION, GENERAL
A. Cold-formed metal framing may be shop or field fabricated for installation, or it may be field assembled.
B. Install cold-formed metal framing according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions" and to manufacturer's written instructions unless more stringent requirements are indicated.
C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.
   1. Screw, bolt, or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch.
D. Install cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened.
   1. Cut framing members by sawing or shearing; do not torch cut.
   2. Fasten cold-formed metal framing members by welding, screw fastening, clinch fastening, or riveting. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
      b. Locate mechanical fasteners and install according to Shop Drawings, and complying with requirements for spacing, edge distances, and screw penetration.
E. Install framing members in one-piece lengths unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion and control joints with cold-formed metal framing. Independently frame both sides of joints.

H. Securely screw attach rigid insulation and sheathing, specified in Division 07 Section “Sheathing,” on exterior framing members in accordance with the manufacturer’s and engineer’s written recommendations.

I. Fasten hole reinforcing plate over web penetrations that exceed size of manufacturer’s standard punched openings.

J. Erection Tolerances: Install cold-formed metal framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:
   1. Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.4 EXTERIOR NON-LOAD-BEARING WALL INSTALLATION

A. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure as indicated.

B. Fasten both flanges of studs to top and bottom track, unless otherwise indicated. Space studs as follows:
   1. Stud Spacing: As determined by engineering analysis submitted for review, but not to exceed 16” o.c.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.

D. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.
   1. Install single-leg deflection tracks and anchor to building structure.
   2. Install double deep-leg deflection tracks and anchor outer track to building structure.
   3. Connect vertical deflection clips to studs and anchor to building structure.
   4. Connect drift clips to cold-formed metal framing and anchor to building structure.

E. Install horizontal bridging in wall studs, spaced in rows indicated on Shop Drawings but not more than 48 inches apart. Fasten at each stud intersection.
   1. Top Bridging for Single Deflection Track: Install row of horizontal bridging within 18 inches of single deflection track. Install a combination of flat, taut, steel sheet straps of width and thickness indicated and stud or stud-track solid blocking of width and thickness matching studs. Fasten flat straps to stud flanges and secure solid blocking to stud webs or flanges.
      a. Install solid blocking at centers indicated on Shop Drawings.
2. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs.

F. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, fasteners, and stud girts, to provide a complete and stable wall-framing system.

3.5 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Field and shop welds will be subject to testing and inspecting.

C. Testing agency will report test results promptly and in writing to Contractor and Architect.

D. Remove and replace work where test results indicate that it does not comply with specified requirements.

E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.6 REPAIRS AND PROTECTION

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed metal framing with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer that ensure that cold-formed metal framing is without damage or deterioration at time of Substantial Completion.

3.7 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 40 00
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 05 50 00 - METAL FABRICATIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Steel framing and supports for overhead doors.
2. Steel framing and supports for countertops.
3. Steel framing and supports for mechanical and electrical equipment.
4. Steel framing and supports for applications where framing and supports are not specified in other Sections.
5. Elevator machine beams and hoist beams.
6. Steel shapes for supporting elevator door sills.
7. Shelf angles.
8. Loose bearing and leveling plates for applications where they are not specified in other Sections.
9. Metal ladders including elevator pit ladders, areaway ladders, rooftop ladders and fire stair access ladders.
10. Steel column cover.
11. Perforated metal grille at interior wall base.
12. Steel column cover.

B. Products furnished, but not installed, under this Section:
1. Loose steel lintels.
2. Anchor bolts, steel pipe sleeves, slotted-channel inserts, and wedge-type inserts indicated to be cast into concrete or built into unit masonry.
3. Steel weld plates and angles for casting into concrete for applications where they are not specified in other Sections.

C. Related Sections:
1. Division 03 Section "Cast-in-Place Concrete" for installing anchor bolts, steel pipe sleeves, slotted-channel inserts, wedge-type inserts, and other items cast into concrete.
2. Division 04 Section "Unit Masonry" for installing loose lintels, anchor bolts, and other items built into unit masonry.
3. Division 05 Section "Structural Steel Framing."
4. Division 05 Section "Metal Stairs."
5. Division 05 Section "Decorative Metal."
6. Division 05 Section "Ornamental Railings."

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance of Ladders: Provide ladders capable of withstanding the effects of loads and stresses within limits and under conditions specified in ANSI A14.3.
B. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.

1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

1.4 ACTION SUBMITTALS

A. Product Data: For the following:
   1. Paint products.
   2. Grout.

B. LEED Submittals:
   1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

C. Shop Drawings: Show fabrication and installation details for metal fabrications.
   1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items.

D. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified professional engineer.

B. Mill Certificates: Signed by manufacturers of stainless-steel certifying that products furnished comply with requirements.

C. Welding certificates.

D. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

1.6 QUALITY ASSURANCE

A. Metal Bar Grating Standards: Comply with NAAMM MBG 531, “Metal Bar Grating Manual.”

B. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
   2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
   3. AWS D1.6, "Structural Welding Code - Stainless Steel."
1.7 PROJECT CONDITIONS
A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

1.8 COORDINATION
A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.
B. Coordinate installation of anchorages and steel weld plates and angles for casting into concrete. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 METALS, GENERAL
A. Metal Surfaces, General: Provide materials with smooth, flat surfaces unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

2.2 FERROUS METALS
A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
B. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
C. Stainless-Steel Sheet, Strip, and Plate: ASTM A 240/A 240M or ASTM A 666, Type 304.
D. Stainless-Steel Bars and Shapes: ASTM A 276, Type 304.
E. Steel Tubing: ASTM A 500, cold-formed steel tubing.
F. Steel Pipe: ASTM A 53/A 53M, standard weight (Schedule 40) unless otherwise indicated.
G. Slotted Channel Framing: Cold-formed metal box channels (struts) complying with MFMA-4.
   2. Material: Cold-rolled steel, ASTM A 1008/A 1008M, structural steel, Grade 33; 0.0966-inch minimum thickness; unfinished, unless otherwise noted.
H. Cast Iron: Either gray iron, ASTM A 48/A 48M, or malleable iron, ASTM A 47/A 47M, unless otherwise indicated.

2.3 NONFERROUS METALS
D. Aluminum Castings: ASTM B 26/B 26M, Alloy 443.0-F.

2.4 FASTENERS

A. General: Unless otherwise indicated, provide Type 304 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, at exterior walls. Select fasteners for type, grade, and class required.

1. Provide stainless-steel fasteners for fastening aluminum.
2. Provide stainless-steel fasteners for fastening stainless steel.

B. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A; with hex nuts, ASTM A 563; and, where indicated, flat washers.

C. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 325, Type 3; with hex nuts, ASTM A 563, Grade C3; and, where indicated, flat washers.

D. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, ASTM F 593; with hex nuts, ASTM F 594; and, where indicated, flat washers; Alloy Group 1.

E. Anchor Bolts: ASTM F 1554, Grade 36, of dimensions indicated; with nuts, ASTM A 563; and, where indicated, flat washers.

1. Hot-dip galvanize or provide mechanically deposited, zinc coating where item being fastened is indicated to be galvanized.

F. Eyebolts: ASTM A 489.

G. Machine Screws: ASME B18.6.3.

I. Wood Screws: Flat head, ASME B18.6.1.

L. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

M. Cast-in-Place Anchors in Concrete: Either threaded type or wedge type unless otherwise indicated; galvanized ferrous castings, either ASTM A 47/A 47M malleable iron or ASTM A 27/A 27M cast steel. Provide bolts, washers, and shims as needed, all hot-dip galvanized per ASTM F 2329.

N. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors.

1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.

O. Slotted-Channel Inserts: Cold-formed, hot-dip galvanized-steel box channels (struts) complying with MFMA-4, 1-5/8 by 7/8 inches by length indicated with anchor straps or studs not less than 3 inches long at not more than 8 inches o.c. Provide with temporary filler and tee-head bolts, complete with washers and nuts, all zinc-plated to comply with ASTM B 633, Class Fe/Zn 5, as needed for fastening to inserts.

2.5 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

B. Shop Primers: Provide primers that comply with Division 09 painting Sections.

C. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

F. Concrete: Comply with requirements in Division 03 Section "Cast-in-Place Concrete" for normal-weight, air-entrained, concrete.

2.6 FABRICATION, GENERAL

A. Galvanizing Locations:
   1. Any exterior steel, whether in contact with exterior air or concealed within an exterior wall is to be hot-dip galvanized unless noted as stainless steel.
   2. Any interior steel is to be primed and painted.

B. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work with accurate angles and surfaces and straight edges.

F. Weld corners and seams continuously to comply with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners or welds where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) fasteners unless otherwise indicated. Locate joints where least conspicuous.

H. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

I. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.

J. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.

1. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches, with a minimum 6-inch embedment and 2-inch hook, not less than 8 inches from ends and corners of units and 24 inches o.c., unless otherwise indicated.

2.7 MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Provide steel framing and supports not specified in other Sections as needed to complete the Work.

B. Fabricate units from steel shapes, plates, and bars of welded construction unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction.

1. Fabricate units from slotted channel framing where indicated.
2. Furnish inserts for units installed after concrete is placed.

C. Galvanize miscellaneous framing and supports where indicated.

D. Prime miscellaneous framing and supports with primer specified in Division 09 Section "High-Performance Coatings" where indicated.

2.8 SHELF ANGLES

A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to concrete framing. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.

1. Provide mitered and welded units at corners.
2. Provide open joints in shelf angles at expansion and control joints. Make open joint approximately 2 inches larger than expansion or control joint.

B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete.

C. Galvanize shelf angles located in exterior walls.
D. Prime shelf angles located in exterior walls with primer specified in Division 09 Section "High-Performance Coatings."

E. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

2.9 METAL LADDERS

A. General:
   1. Comply with ANSI A14.3 unless otherwise indicated.
   3. For elevator pit ladders, comply with ASME A17.1.

B. Steel Ladders:
   1. Space siderails 18 inches apart unless otherwise indicated.
   2. Space siderails of elevator pit ladders 12 inches apart.
   3. Siderails: Continuous, 1/2-by-2-1/2-inch steel flat bars, with eased edges.
   4. Rungs: 3/4-inch- diameter or 3/4-inch- square steel bars.
   5. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
   6. Provide nonslip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
   7. Provide nonslip surfaces on top of each rung by coating with abrasive material metallically bonded to rung.
      a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
         1) IKG Industries, a division of Harsco Corporation; Mebac.
         2) SlipNOT Metal Safety Flooring, a W. S. Molnar company; SlipNOT.
   8. Provide platforms as indicated fabricated from welded or pressure-locked steel bar grating, supported by steel angles. Limit openings in gratings to no more than 3/4 inch in least dimension.
   9. Support each ladder at top and bottom and not more than 60 inches o.c. with welded or bolted steel brackets.
   10. Galvanize exterior ladders, including brackets and fasteners.
   11. Prime exterior ladders, including brackets and fasteners, with zinc-rich primer.

2.10 METAL GRATINGS

A. Basis-of-Design Manufacturer: McNichols Co., or equal.

B. Electroforged Bar Grating, Welded construction:
   2. AKA Description: GW 150.
   4. Bearing Bar Spacing: 1.1875 inches o.c.
   5. Bearing Bar Depth: 1.5 inch.
   6. Bearing Bar Thickness: 0.1875 inches.
   7. Crossbar Spacing: 4 inches o.c.
   8. Spacing Description: 19-W-4.
   9. Percent Open Area: 77%.
10. Weight: 10.8 #/sf.
11. Panel size: 24"x240".
12. McNichols Item Number: 6402310122.

C. Removable Grating Sections: Fabricate with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated or, if not indicated, as recommended by manufacturer for attaching to supports.
1. Provide no fewer than four saddle clips for each grating section composed of rectangular bearing bars 3/16 inch (4.8 mm) or less in thickness and spaced 15/16 inch (24 mm) or more o.c., with each clip designed and fabricated to fit over two bearing bars.
2. Provide no fewer than four weld lugs for each grating section composed of rectangular bearing bars 3/16 inch (4.8 mm) or less in thickness and spaced less than 15/16 inch (24 mm) o.c., with each lug shop welded to three or more bearing bars. Interrupt intermediate bearing bars as necessary for fasteners securing grating to supports.
3. Secure grating to supports as indicated on Drawings.

D. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.
1. Edge-band openings in grating that interrupt four or more bearing bars with bars of same size and material as bearing bars.

2.11 GRATING FRAMES AND SUPPORTS

A. Frames and Supports for Metal Gratings: Fabricate from metal shapes, plates, and bars of welded construction to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections for perimeter angle frames. Cut, drill, and tap units to receive hardware and similar items.
1. Unless otherwise indicated, fabricate from same basic metal as gratings.
2. Where frames and supports are aluminum to match aluminum gratings, separate metal from adjacent concrete, CMU and limestone with a layer of bituminous paint or neoprene spacer strips.
3. Equip units indicated to be cast into concrete or built into masonry with integrally welded anchors. Unless otherwise indicated, space anchors 24 inches (600 mm) o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches (32 mm) wide by 1/4 inch (6 mm) thick by 8 inches (200 mm) long.

B. Galvanize steel frames and supports in the following locations:
1. Exterior.

2.12 PERFORATED METAL GRILLE

1. Perforated Metal Grille at Interior Wall Base:
a. Basis of Design: Provide Straight Slotted Perforated Sheet Metal Grille as manufactured by McNichols Co., or approved equal.
   1) Material: 18 ga. steel
   2) Perforation Size: ¼" x 1-1/2"
   3) Arrangement: Straight.
   4) Side and End Bars: 3/32"
   5) Open Area: 68%
   6) Finish: Prefinished matte black.
2.13 STEEL COLUMN COVER

A. Basis-of-Design Product: Subject to compliance with requirements, provide Series FF Column Cover by Fry Reglet Architectural Metals, or approved equal.
   1. Material: Steel.
   3. Type: Series FF Monolithic, Field Taped & Finished.
   4. Diameter: 20” diameter, with 18” recessed base; see details on Drawings.

2.14 MISCELLANEOUS STEEL TRIM

A. Unless otherwise indicated, fabricate units from steel shapes, plates, and bars of profiles shown with continuously welded joints and smooth exposed edges. Miter corners and use concealed field splices where possible.

B. Provide cutouts, fittings, and anchorages as needed to coordinate assembly and installation with other work.
   1. Provide with integrally welded steel strap anchors for embedding in concrete or masonry construction.

C. Galvanize exterior miscellaneous steel trim.

D. Prime exterior and interior miscellaneous steel trim with zinc-rich primer.

2.15 LOOSE BEARING AND LEVELING PLATES

A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction. Drill plates to receive anchor bolts and for grouting.

B. Galvanize plates.

2.16 LOOSE STEEL LINTELS

A. Fabricate loose steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated. Fabricate in single lengths for each opening unless otherwise indicated. Weld adjoining members together to form a single unit where indicated.

B. Size loose lintels to provide bearing length at each side of openings equal to 1/12 of clear span but not less than 8 inches unless otherwise indicated.

C. Galvanize loose steel lintels located in exterior walls.

2.17 STEEL WELD PLATES AND ANGLES

A. Provide steel weld plates and angles not specified in other Sections, for items supported from concrete construction as needed to complete the Work. Provide each unit with no fewer than two integrally welded steel strap anchors for embedding in concrete.
2.18 FRAMING FOR INTERIOR ARCHITECTURAL WOODWORK

A. Shop fabricate and assemble framing for interior architectural woodwork to the maximum extent possible. Locate field joints at concealed locations, if possible. Detail assemblies to minimize handling and to expedite erection.

B. Fabrication:
1. Fabricate with exposed surfaces smooth, square, and free of surface blemishes including pitting, rust, scale and roughness.
2. Grind sheared, punched, and flame cut edges to remove burrs and provide smooth surfaces and edges.
3. Fabricate with exposed surfaces free of mill marks, including rolled trade names and stamped or raised identification.
4. Fabricate with exposed surfaces free of seams to maximum extent possible.
5. Remove blemishes by filing or grinding or by welding and grinding, before cleaning, treating, and shop priming.
6. Fabricate with piece marks fully hidden in the completed structure or made with media that permits full removal after erection.
7. Seal weld open ends of hollow structural sections with 3/8 inch closure plates.
8. Bolt holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces. Do not thermally cut bolt holes or enlarge holes by burning.

C. Welding:
1. Install filler material at stitch welded connections for a finished appearance of a continuous welded connection.

2.19 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish metal fabrications after assembly.

C. Finish exposed surfaces to remove tool and die marks and stretch lines, and to blend into surrounding surface.

2.20 STEEL AND IRON FINISHES

A. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M for other steel and iron products.
1. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.

B. Shop prime iron and steel items not indicated to be galvanized unless they are to be embedded in concrete, sprayed-on fireproofing, or masonry, or unless otherwise indicated.
1. Shop prime with primers specified in Division 09 painting Sections unless indicated.

C. Preparation for Shop Priming: Prepare surfaces to comply with requirements indicated below:
3. Decorative Metal, Decorative Metal Railings, and other steel fabrications exposed in finish construction: Refer to Division 05 Sections “Decorative Metal,” or “Decorative Metal Railings.”

5. Other Items: SSPC-SP 3, "Power Tool Cleaning."

D. Shop Priming: Apply shop primer to comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.

   1. Stripe paint corners, crevices, bolts, welds, and sharp edges.

2.21 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

B. As-Fabricated Finish: AA-M10 (Mechanical Finish: as fabricated, unspecified).

2.22 STAINLESS STEEL FINISHES

A. Remove tool and die marks and stretch lines or blend into finish.

B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

C. Dull Satin Finish: No. 6.

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.

B. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

C. Field Welding: Comply with the following requirements:

   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag screws, wood screws, and other connectors.

E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with the following:

1. Cast Aluminum: Heavy coat of bituminous paint.
2. Extruded Aluminum: Two coats of clear lacquer.

3.2 INSTALLING MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.

B. Anchor supports for operable partitions securely to and rigidly brace from building structure.

C. Support steel girders on solid grouted masonry, concrete, or steel pipe columns. Secure girders with anchor bolts embedded in grouted masonry or concrete or with bolts through top plates of pipe columns.

1. Where grout space under bearing plates is indicated for girders supported on concrete or masonry, install as specified in "Installing Bearing and Leveling Plates" Article.

D. Install pipe columns on concrete footings with grouted baseplates. Position and grout column baseplates as specified in "Installing Bearing and Leveling Plates" Article.

1. Grout baseplates of columns supporting steel girders after girders are installed and leveled.

3.3 INSTALLING BEARING AND LEVELING PLATES

B. Set bearing and leveling plates on wedges, shims, or leveling nuts. After bearing members have been positioned and plumbed, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.

1. Use nonshrink grout, either metallic or nonmetallic, in concealed locations where not exposed to moisture; use nonshrink, nonmetallic grout in exposed locations unless otherwise indicated.

2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.4 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.

1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.
B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 50 00
SECTION 05 51 00 - METAL STAIRS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Preassembled steel stairs with concrete-filled treads.
2. Steel railings attached to metal stairs.
3. Steel tube handrails attached to walls adjacent to metal stairs.
4. Railing gates at the level of exit discharge.
5. Steel tube handrails noted on Drawings but not associated with stairs.

B. Related Sections:

1. Division 03 Section "Cast-in-Place Concrete" for concrete fill for stair treads and platforms.
2. Division 05 Section "Metal Fabrications" for metal ladders.
3. Division 05 Section "Decorative Metal Railings" for ornamental metal railings.
4. Division 05 Section "AESS" for Monumental Stair C.
5. Division 09 Section "Non-Structural Metal Framing" for metal backing for anchoring railings.
6. Division 09 Section "Stone Flooring" for stone treads and landings for ornamental steel-framed stairs.
7. Division 09 Sections "Painting" and for primers and paint finishes.

1.3 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design metal stairs, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Structural Performance of Stairs: Metal stairs shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.

1. Uniform Load: 100 lbf/sq. ft.
2. Concentrated Load: 300 lbf applied on an area of 4 sq. in.
3. Uniform and concentrated loads need not be assumed to act concurrently.
4. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
5. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.

C. Structural Performance of Railings: Railings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.
1. Handrails Assemblies and Guards:
   a. Uniform load of 50 lb/ft applied in any direction, and to transfer that load through the supports to the structure.
   b. Concentrated load of 200 lb applied in any direction along the top, and to have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building.
   c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Infill of Guards:
   a. Concentrated load of 200 lb applied horizontally on an area of 1 sq. ft.
   b. Uniform load of 50 lb/sq ft applied horizontally.
   c. Infill load and other loads need not be assumed to act concurrently.

D. Seismic Performance: Metal stairs shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
   1. Component Importance Factor is 1.25.

1.4 ACTION SUBMITTALS

A. Product Data: For metal stairs and the following:
   1. Prefilled metal-pan stair treads.
   2. Metal floor plate treads.
   3. Paint products.

B. LEED Submittals:
   1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Provide templates for anchors and bolts specified for installation in other Sections.
   2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   3. For items indicated to conform to performance requirements and design criteria, shop drawings shall be signed and sealed by a qualified professional engineer.

D. Samples for Initial Selection: For products involving selection of color, texture, or design.

E. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, submit analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified professional engineer and testing agency.
B. Welding certificates.

C. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

D. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for stairs and railings.

1. Test railings according ASTM E 894 and ASTM E 935.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.

1. Preassembled Stairs: Commercial class for enclosed fire stairs.
2. Industrial-Type Stairs: Industrial class.
3. Ornamental Stairs: Architectural class.

C. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

D. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."

1.7 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

C. Coordinate locations of hanger rods and struts with other work so that they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
2.2 **FERROUS METALS**

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

C. Steel Tubing: ASTM A 500 (cold formed).

D. Uncoated, Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, either commercial steel, Type B, or structural steel, Grade 25, unless another grade is required by design loads; exposed.

E. Galvanized-Steel Sheet: ASTM A 653/A 653M, G90 coating, either commercial steel, Type B, or structural steel, Grade 33, unless another grade is required by design loads.

F. Perforated Metal: Cold-rolled steel sheet, ASTM A 1008/A 1008M, or hot-rolled steel sheet, ASTM A 1011/A 1011M, commercial steel Type B, 0.060 inch thick, with 1/4-inch round holes @ 3/8 inch o.c. in staggered rows.

2.3 **FASTENERS**

A. General: Provide zinc-plated fasteners with coating complying with ASTM B 633 or ASTM F 1941, Class Fe/Zn 12 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.

B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A; with hex nuts, ASTM A 563; and, where indicated, flat washers.

C. Anchor Bolts: ASTM F 1554, Grade 36, of dimensions indicated; with nuts, ASTM A 563; and, where indicated, flat washers.

   1. Provide mechanically deposited or hot-dip, zinc-coated anchor bolts for stairs indicated to be galvanized.

D. Machine Screws: ASME B18.6.3.

E. Lag Screws: ASME B18.2.1.

H. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

   1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.
2.4 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

B. Shop Primers: Provide primers that comply with Division 09 painting Sections.

C. Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

F. Concrete Materials and Properties: Comply with requirements in Division 03 Section "Cast-in-Place Concrete" for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.

2.5 FABRICATION, GENERAL

A. Provide complete stair assemblies, including metal framing, hangers, struts, railings, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.
   1. Join components by welding unless otherwise indicated.
   2. Use connections that maintain structural value of joined pieces.
   3. Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.

B. Preassembled Stairs: Assemble stairs in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work with accurate angles and surfaces and straight edges.

F. Weld connections to comply with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Weld exposed corners and seams continuously unless otherwise indicated.
   5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated. Locate joints where least conspicuous.

H. Fabricate joints that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

### 2.6 STEEL-FRAMED STAIRS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Alfab, Inc.
2. American Stair, Inc.
3. Sharon Companies Ltd. (The).

B. Stair Framing:

1. Fabricate stringers of steel channels.
   a. Provide closures for exposed ends of channel stringers.

2. Construct platforms of steel plate or channel headers and miscellaneous framing members as needed to comply with performance requirements.

3. Weld stringers to headers; weld framing members to stringers and headers.

4. Where stairs are enclosed by gypsum board shaft-wall assemblies, provide hanger rods or struts to support landings from floor construction above or below. Locate hanger rods and struts where they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.

5. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

C. Metal-Pan Stairs: Form risers, subtread pans, and subplatforms to configurations shown from steel sheet of thickness needed to comply with performance requirements but not less than 0.067 inch.

1. Steel Sheet: Uncoated cold-rolled steel sheet unless otherwise indicated.
2. Steel Sheet: Galvanized-steel sheet, where indicated.
3. Attach risers and subtreads to stringers with brackets made of steel angles or bars. Weld brackets to stringers and attach metal pans to brackets by welding, riveting, or bolting.
4. Shape metal pans to include nosing integral with riser.
5. Provide subplatforms of configuration indicated or, if not indicated, the same as subtreads. Weld subplatforms to platform framing.

### 2.7 STAIR RAILINGS

A. Steel Railings: Fabricate railings to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of tube, post spacings, and anchorage, but not less than that needed to withstand indicated loads.

1. Rails and Posts: as indicated in the Drawings. For stairs in mechanical rooms and other non-public places which are not detailed in Drawings, provide 1-1/2-inch diameter round top and bottom rails and 1-1/2-inch square posts.
2. Picket Infill: as indicated in the Drawings. For stairs in mechanical rooms and other non-public places which are not detailed in Drawings, provide 1/2-inch- square pickets spaced less than 4 inches clear.

3. Gates: Construct gate as shown on Drawings, with perforated metal sheet infill. Provide each gate with two Partsko cast stainless steel round barrel gravity hinge, #656-8056. Provide overlapping stop with rubber bumper to prevent gate from opening in direction opposite egress.

B. Welded Connections: Fabricate railings with welded connections. Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

1. Finish welds at mechanical room stairs which are in non public areas to comply with NOMMA's "Voluntary Joint Finish Standards" for Type 3 welds: partially dressed weld with spatter removed.

C. Form changes in direction of railings as follows:

1. By radius bends of radius indicated or by inserting prefabricated elbow fittings of radius indicated.

D. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

E. Close exposed ends of railing members with prefabricated end fittings.

F. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.

G. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work. Furnish inserts and other anchorage devices for connecting to concrete or masonry work.

1. Connect posts to stair framing by direct welding unless otherwise indicated.
2. For galvanized railings, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous-metal components.
3. For nongalvanized railings, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.

H. Fillers: Provide fillers made from steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

2.8 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish metal stairs after assembly.
C. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M for other steel and iron products.
   1. ASTM A 123/A 123M, for galvanizing steel and iron products.
   2. ASTM A 153/A 153M, for galvanizing steel and iron hardware.
   3. Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.
   4. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

D. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed products:
   1. Interior Stairs: SSPC-SP 3, "Power Tool Cleaning."

E. Apply shop primer to uncoated surfaces of metal stair components, except those with galvanized finishes and those to be embedded in concrete or masonry unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
   1. Stripe paint corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

F. Field Welding: Comply with requirements:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
4. At exposed conditions, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Place and finish concrete fill for treads and platforms to comply with Division 03 Section "Cast-in-Place Concrete."

3.2 INSTALLING RAILINGS

A. Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and rail ends to building construction as follows:

1. Anchor posts to steel by welding directly to steel supporting members.
2. Anchor handrail ends to concrete and masonry with steel round flanges welded to rail ends and anchored with postinstalled anchors and bolts.

B. Attach handrails to wall with wall brackets. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:

1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
2. For hollow masonry anchorage, use toggle bolts.
3. For steel-framed gypsum board assemblies, fasten brackets directly to steel framing or concealed steel reinforcements using self-tapping screws of size and type required to support structural loads.

3.3 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.

1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.

B. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Division 09 painting Sections.

C. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
1. Aluminum.
2. Plastic Materials
3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 51 00
SECTION 05 70 00 - DECORATIVE METAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Decorative metal extrusions, plates, and other trim pieces.
   2. Perforated ss metal panels.

B. Related Sections:
   1. Division 05 Section "Metal Fabrications" for non-decorative metal fabrications.
   2. Division 05 Section "Ornamental Railings" for stainless steel fittings used with glass railings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated, including finishing materials.

B. LEED Submittals:
   1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

C. Shop Drawings: Show fabrication and installation details for decorative metal.
   1. Include plans, elevations, component details, and attachments to other work.
   2. Indicate materials and profiles of each decorative metal member, fittings, joinery, finishes, fasteners, anchorages, and accessory items.

D. Samples for Initial Selection: For products involving selection of color, texture, or design.

E. Samples for Verification: For each type of exposed finish required.
   1. Sections of linear shapes.
   2. Samples of welded joints showing quality of workmanship.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified fabricator and anodic finisher.

B. Mill Certificates: Signed by manufacturers of stainless-steel certifying that products furnished comply with requirements.

C. Welding certificates.

1.5 QUALITY ASSURANCE

A. Fabricator Qualifications: A firm experienced in producing decorative metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
B. Installer Qualifications: Fabricator of products.

C. Anodic Finisher Qualifications: A firm experienced in successfully applying anodic finishes of type indicated and employing competent control personnel to conduct continuing, effective quality-control program to ensure compliance with requirements.

D. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
   2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
   4. AWS D1.6, "Structural Welding Code - Stainless Steel."

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockups for the following types of decorative metal:
      a. Include all required anodized aluminum extrusions and plates, as shown in Drawings, in mockup for corrugated aluminum ceiling constructed from Aero material specified in Division 09 Section “Interior Metal Surfaces.” Extent of mockup to as directed by Architect.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

F. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store decorative metal in a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with decorative metal by field measurements before fabrication and indicate measurements on Shop Drawings.

1.8 COORDINATION

A. Coordinate installation of anchorages for decorative metal items. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth, flat surfaces unless otherwise indicated. Provide materials without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

2.2 ALUMINUM

A. Aluminum, General: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with strength and durability properties for each aluminum form required not less than that of alloy and temper designated below.
B. Extruded Bars and Shapes: ASTM B 221 (ASTM B 221M), Alloy 6063-T5/T52.

C. Plate and Sheet: ASTM B 209 (ASTM B 209M), Alloy 5005-H32.

2.3 STAINLESS STEEL

A. Tubing: ASTM A 554, Grade MT 304, unless otherwise indicated.

B. Pipe: ASTM A 312/A 312M, Grade TP 304, unless otherwise indicated.

C. Castings: ASTM A 743/A 743M, Grade CF 8 or CF 20, unless otherwise indicated.

D. Sheet, Strip, Plate, and Flat Bar: ASTM A 666, Type 304, unless otherwise indicated.

E. Bars and Shapes: ASTM A 276, Type 304, unless otherwise indicated.

F. Perforated Plate: ASTM A 666, Type 304
   1. 3/16” thick plate with perforation pattern as shown in Drawings.

2.4 FASTENERS

A. Fastener Materials: Unless otherwise indicated, provide the following:
   1. Aluminum Items: Type 304 stainless-steel fasteners.
   2. Stainless-Steel Items: Type 304 stainless-steel fasteners.
   3. Dissimilar Metals: Type 304 stainless-steel fasteners.

B. Fasteners for Anchoring to Other Construction: Unless otherwise indicated, select fasteners of type, grade, and class required to produce connections suitable for anchoring indicated items to other types of construction indicated.

C. Provide concealed fasteners for interconnecting components and for attaching decorative metal items to other work unless otherwise indicated.
   1. Provide square drive countersunk machine screws for exposed fasteners unless otherwise indicated.

D. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

E. Post-Installed Anchors: Torque-controlled expansion type or chemical type.
   1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941 (ASTM F 1941M), Class Fe/Zn 5 unless otherwise indicated.

2.5 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
   1. For aluminum, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
2.6 FABRICATION, GENERAL

A. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

B. Form decorative metal to required shapes and sizes, true to line and level with true curves and accurate angles and surfaces. Finish exposed surfaces to smooth, sharp, well-defined lines and arris.

C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.

D. Form simple and compound curves in bars, pipe, tubing, and extruded shapes by bending members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces.

E. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch (1 mm) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

F. Mill joints to a tight, hairline fit. Cope or miter corner joints. Fabricate connections that will be exposed to weather in a manner to exclude water.

G. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.

H. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Cut, reinforce, drill, and tap as needed to receive finish hardware, screws, and similar items unless otherwise indicated.

I. Comply with AWS for recommended practices in shop welding. Weld behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded joints of flux, and dress exposed and contact surfaces.

1. Where welding cannot be concealed behind finished surfaces, finish joints to comply with NOMMA's "Voluntary Joint Finish Standards" for Type 1 Welds: no evidence of a welded joint.

2.7 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.8 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

B. Clear Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm or thicker.

1. Texture: Matte finish.
2.9 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.
   1. Run grain of directional finishes with long dimension of each piece.

C. Dull Satin Finish: No. 6.

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of decorative metal.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Provide anchorage devices and fasteners where needed to secure decorative metal to in-place construction.

B. Perform cutting, drilling, and fitting required to install decorative metal. Set products accurately in location, alignment, and elevation, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.

C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of decorative metal, restore finishes to eliminate evidence of such corrective work.

D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.

E. Install concealed gaskets, joint fillers, insulation, and flashings as work progresses.

F. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.
   1. Retain protective coverings intact; remove coverings simultaneously from similarly finished items to preclude nonuniform oxidation and discoloration.

G. Field Welding: Comply with applicable AWS specification for procedures of manual shielded metal arc welding and requirements for welding and for finishing welded connections in "Fabrication, General" Article. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.

H. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
3.3 CLEANING AND PROTECTION

A. Unless otherwise indicated, clean metals by washing thoroughly with clean water and soap, rinsing with clean water, and drying with soft cloths.

B. Protect finishes of decorative metal from damage during construction period with temporary protective coverings approved by decorative metal fabricator. Remove protective covering at time of Substantial Completion.

C. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 70 00
SECTION 05 72 10 - ORNAMENTAL RAILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Laminated glass guardrail for monumental stair.
2. Other laminated glass guard rails not associated with stair as indicated in the Drawings.
3. Stainless-steel decorative railings attached to glass guardrail.
4. Stainless-steel decorative railing attached to wall.
5. Glass draft curtain and recessed mounting shoe.
6. Fabricated specialty stainless steel fittings, attachments, brackets and hardware for anchorage associated with guard rails and hand rails as indicated on construction drawings.
7. All glass and glazing work required as part of ornamental railings shall be provided and installed as work of this Section, but shall also comply with the requirements of Division 8 Section “Glazing.”

B. Work under this Section consists of furnishing all labor, materials, equipment and services necessary for, and incidental to, the complete and proper fabrication, erection, and installation of all ornamental railings and related work as shown on the drawings or specified herein, and in accordance with all applicable requirements of the Contract Documents.

C. The material and installation shall conform to the applicable building code and other requirements of all authorities having jurisdiction.

D. Related Sections:
1. Division 8 Section “Glazing”.
2. Division 5 Section “Arch Exposed Structural Steel” for ornamental steel framed stair.
3. Division 9 Section “Stone Flooring” for stair treads and risers.

1.3 DEFINITIONS

A. Railings: Guards, handrails, and similar devices used for protection of occupants at open-sided floor areas, pedestrian guidance and support, visual separation, or wall protection.

B. Deterioration of Laminated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes such as glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer’s written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

1.4 PERFORMANCE REQUIREMENTS

A. General: In engineering railings to withstand structural loads indicated, determine allowable design working stresses of railing materials based on the following:
1. Stainless Steel: 60 percent of minimum yield strength.
2. Steel: 72 percent of minimum yield strength.
3. Glass: 25 percent of mean modulus of rupture (50 percent probability of breakage), as listed in "Mechanical Properties" in AAMA's Aluminum Curtain Wall Series No. 12, "Structural Properties of Glass."

B. The Contractor shall engineer ornamental railing fabrications and connections required by the Contract Documents to be capable of withstanding the effects of live loads, gravity loads and other loads and stresses within limits required and under conditions indicated for the materials or equipment to be supported.
1. Design ornamental railing fabrications and glass to withstand design loads without vertical or lateral deflections that exceed the tolerances required by the materials or equipment being supported.
2. The Contractor shall account for all the loads imposed on the system including self weight, wind loads and seismic loads in accordance with the local building code.

C. Engineering Responsibility: All ornamental metalwork and glass shall be designed by a Structural Engineer licensed in the State of Pennsylvania and retained by the Contractor. The system shall be fabricated and erected under the direction of a Structural Engineer licensed in the State of Pennsylvania and retained by the Contractor. The Contractor shall submit shop drawings and structural calculations prepared, stamped and signed by a Pennsylvania Registered Structural Engineer to the Design Engineer for review and approval by the Building Department, and must obtain a permit prior to construction.

D. Structural Performance: Glass and metal railings shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
1. Handrails and Top Rails of Guards:
   a. Uniform load of 50 lbf/ft. applied in any direction.
   b. Concentrated load of 200 lbf applied in any direction.
   c. Uniform and concentrated loads need not be assumed to act concurrently.
2. Infill of Guards:
   a. Concentrated load of 200 lbf applied horizontally on an area of 1 sq. ft.
   b. Infill load and other loads need not be assumed to act concurrently.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.
1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

F. Design ornamental metalwork fabrications and glass to accommodate deflection of primary buildings structure and construction tolerances.

G. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1.5 SUBMITTALS
A. General: Submit the following in accordance with Conditions of the Contract and Division 1 Specification Sections.

B. Product Data: For each type of product indicated, including finishing materials.
C. Shop Drawings:

1. Shop drawings shall be prepared under the supervision of a professional engineer licensed in
   Pennsylvania and shall have the signature and seal of the professional engineer in that
   jurisdiction.

2. Include plans, elevations, component details, and attachments to other work. Provide the
   following information:
   a. Tolerances
   b. Profiles of members
   c. Anchorage system
   d. Field welding
   e. Connections and Fasteners
   f. Provisions for expansion and contraction
   g. Set-out of all work, including reference points, edge conditions, and joint pattern,
      indicated on plans, elevations, and sections as applicable.
   h. Framing, anchorages, and fixings supported from base-structure, and embeddings in
      the base-structure, if required.
   i. Methods of assembly at all junctions indicated by three –dimensional and exploded
      views if requested.

3. Indicate materials and profiles of each decorative metal member, fittings, joinery, finishes,
   fasteners, anchorages, and accessory items.

4. Include details of cuts, connections, splices and other pertinent data.

5. For installed products indicated to comply with design loads, include structural analysis data
   signed and sealed by the qualified professional engineer responsible for their preparation.

6. Shop drawings shall show layout, spacings, sizes, thicknesses and types of ornamental
   metalwork, fabrication, fastening and anchorage details, including welded connections and
   mechanical fasteners. Indicate materials, profiles of each member and fitting, joinery,
   connection details, finishes, fasteners, anchorages and accessory items. Show reinforcing,
   supplemental framing, bracing, bridging, splices and attachments to other units of Work, and
   other details required for proper installation.

7. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and
   show size, length, and type of each weld. Clearly indicate finishing and polishing
   requirements for welds that will be exposed in finish work.

8. Field verify existing conditions, prior to commencing drawings.

D. Samples for Initial Selection: For products involving selection of color, texture, or design,
   including mechanical finishes.

E. Samples for Verification: For each type of exposed finish required.

1. Each type of glass required.
2. Fittings and brackets.
3. Welded connections.
4. Assembled Samples of railing systems, made from full-size components.

F. Qualification Data: For qualified professional engineer.

G. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products
   furnished comply with requirements.

H. Welding certificates.

I. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing
   agency, according to ASTM E 894 and ASTM E 935.

J. Preconstruction test reports.
1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of railing from single source from single manufacturer.

B. Source Limitations for Clear Low-Iron Glass: Where Low-Iron glass is specified in the Glass Schedule, Contractor shall coordinate fabricators to procure low-iron float glass from one primary-glass source.
   1. Acceptable Manufacturers include the following:
      b. Pilkington: “Optiwhite” (www.lof.com)

C. Source Limitations for Laminated Glass: Obtain laminated-glass units from one manufacturer using the same type of glass lites and interlayers for each type of unit indicated.

D. Product Options: Information on Drawings and in Specifications establishes requirements for system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including structural analysis, preconstruction testing, field testing, and in-service performance.
   1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

E. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.6, "Structural Welding Code - Stainless Steel."

F. Safety Glazing Labeling: Permanently mark glass with certification label of the SGCC or another certification agency acceptable to authorities having jurisdiction. Label shall indicate manufacturer’s name, type of glass, thickness, and safety glazing standard with which glass complies.

G. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockups for each form and finish of railing consisting of handrail, structural glazing, and anchorage system components that are full height and are not less than 24 inches in length.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

H. Pre-installation Conference: Conduct conference at Project site with ornamental metal and railing manufacturer, installer, Contractor, Architect, Structural Engineer and other interested parties to review procedures, schedules, and coordination of installation of other elements of the work.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.

1.8 COORDINATION AND SCHEDULING

A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
B. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not suit structural performance requirements.

1.9 WARRANTY

A. General Warranty: Special warranties specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Manufacturer's Special Warranty on Laminated Glass: Written warranty, made out to Owner and signed by laminated-glass manufacturer agreeing to furnish replacements for laminated-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Brackets, Flanges, and Anchors: Same metal and finish as supported rails unless otherwise indicated.

2.2 STAINLESS STEEL

A. Tubing: ASTM A 554, Grade MT 304

B. Pipe: ASTM A 312/A 312M, Grade TP 304

C. Castings: ASTM A 743/A 743M, Grade CF 8 or CF 20

D. Sheet, Strip, Plate, and Flat Bar: ASTM A 666, Type 304

E. Bars and Shapes: ASTM A 276, Type 304

2.3 GLASS DRAFT CURTAIN SHOE

A. Basis of Design: Provide two-piece mounting bracket SB-200 by Blumcraft, or equal.
   a. Two piece mounting bracket isolates glass panels from shock of building movement.
   b. Provide readily accessible bolts for easy glass panel replacement.
   c. Mandatory bonding of SB-200 base to glass at factory under controlled conditions.
   d. Install per manufacturer's instructions and according to the Drawings.

2.4 GLASS AND GLAZING MATERIALS

A. Tempered Glass: ASTM C 1048, Kind FT (fully tempered), Condition A (uncoated), Type 1 (transparent flat glass), Quality-Q3. Provide products that have been tested for surface and edge
compression according to ASTM C 1048 and for impact strength according to 16 CFR 1201 for Category II materials.

1. Glass Color: Clear
2. Thickness for Structural Glass Balusters: As required by structural loads.

B. Glazing Gaskets and Bushings: Clear silicone.

C. GLASS

2. Quality Control: All glass shall be manufactured and processed in a factory where the quality control procedures comply with ISO 9002 and are independently maintained.
3. Defects: The glass shall be cut clean, without edge faults such as feathered edges, shells or other imperfections. In all structural applications such as glass fins or point-supported glass and with all toughened glass, all edges shall be ground to eliminate edge defects.
4. Manufacturing Tolerances - In general as set out by ASTM C1036 -
   a. Minimum Actual Glass Thickness for Nominal Specified Glass Thickness:
   b. Not less than those specified in ASTM E 1300 Table A4.1
5. Fabrication Tolerances:
   a. Thickness <6mm (1/4") 8 & 10mm (5/16" & 3/8") 12 (1/2" & 15mm (5/8")
   b. Warp: ±0.196" per yard measured along straight edge
   c. Any dim. < 3'-3" ±0.04" ±0.08" ±0.08"
   d. Any dim. > 3'-3" ±0.04" ±0.08" ±0.11" 
   e. Squareness shall be measured by a comparison of diagonals.
   f. Diagonals up to 78.74": ±0.15".
   g. Diagonals over 78.74": ±0.19".
   h. Edge straightness: ±0.036" per foot
6. All glass shall be prefabricated and delivered in the required sizes. No on-site cutting, nipping or drilling will be allowed.
7. Edge working: All edges shall be ground and polished unless specifically indicated otherwise on construction documents.

D. LAMINATED GLASS

1. Laminated Glass: Comply with ASTM C 1172 for kinds of laminated glass indicated and other requirements specified.
2. Interlayer: Interlayer material as indicated below, clear or in colors, and of thickness indicated with a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after laminating glass lites and installation.
   a. Interlayer Material: cured resin or Polyvinyl butyral sheets, including Sentry Glass Plus (DUPONT).
3. Laminating Process: Fabricate laminated glass to produce glass free of foreign substances and air or glass pockets as follows:
   a. Laminate lites with polyvinyl butyral interlayer in autoclave with heat plus pressure.
   b. Laminate lites with laminated glass manufacturer's standard cast-in-place and cured transparent resin interlayer.
4. Glass Thickness: Drawings indicate 1" thick glass. It is the responsibility of the Designated Design Engineer to verify glass thickness and notify Architect of any variations.
2.5 FASTENERS

A. Fastener Materials: Unless otherwise indicated, provide the following:
   1. Stainless-Steel Components: Type 304 stainless-steel fasteners.

B. Fasteners for Anchoring to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.

C. Provide concealed fasteners for interconnecting railing components and for attaching railings to other work unless exposed fasteners are unavoidable.

D. Anchors, General: Anchors capable of sustaining, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

2.6 FABRICATION

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form work true to line and level with accurate angles and surfaces.

E. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

F. Welded Connections:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove flux immediately.
   4. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Type 1 welds: no evidence of a welded joint.

G. Mechanical Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.

H. Form changes in direction as follows:
   1. As detailed.

I. Close exposed ends of hollow railing members with prefabricated end fittings.

J. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated. Close ends of returns, unless clearance between end of rail and wall is 1/4 inch or less.
K. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.

1. At brackets and fittings fastened to plaster or gypsum board partitions, provide crush-resistant fillers, or other means to transfer loads through wall finishes to structural supports and prevent bracket or fitting rotation and crushing of substrate.

L. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.

2.7 GLAZING PANEL FABRICATION

A. General: Fabricate to sizes and shapes required; provide for proper edge clearance and bite on glazing panels.

1. Clean-cut or flat-grind edges at butt-glazed sealant joints to produce square edges with slight chamfers at junctions of edges and faces
2. Grind smooth exposed edges, including those at open joints, to produce square edges with slight chamfers at junctions of edges and faces.

2.8 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM’s "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

2.9 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

1. Run grain of directional finishes with long dimension of each piece.

C. Dull Satin Finish: No. 6.

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine plaster and gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

3.2 INSTALLATION, GENERAL

A. Fit exposed connections together to form tight, hairline joints.
B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.

1. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.
C. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
D. Adjust railings before anchoring to ensure matching alignment at abutting joints.
E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.3 INSTALLING GLASS PANELS

A. Glass-Supported Railings: Install assembly to comply with railing manufacturer's written instructions.

1. Adjust spacing of glass panels so gaps between panels are equal before securing in position.
B. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.

3.4 CLEANING

A. Clean aluminum and stainless steel by washing thoroughly with clean water and soap, rinsing with clean water, and wiping dry.
B. Clean and polish glass as recommended in writing by manufacturer. Wash both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Completion.
3.5 PROTECTION

A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

C. Protect glass from contact with contaminating substances resulting from construction operations, including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove them immediately as recommended by glass manufacturer.

D. Remove and replace glass that is broken, chipped, cracked, abraded, or damaged in any way, including natural causes, accidents, and vandalism, during construction period.

E. Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended by glass manufacturer.

3.6 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 05 72 10
PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
1. Rooftop equipment bases and support curbs.
2. Wood blocking, cants, and nailers.
3. Wood furring and grounds.
4. Plywood sheathing and backing panels.
5. Spaced board sheathing over furring for slate shingle roof.
6. Concealed plywood blocking for shelving.

B. Related Requirements:
1. Division 01 Section "LEED Requirements" for additional LEED requirements.
2. Division 06 Section "Sheathing."

1.3 DEFINITIONS
A. Exposed Framing: Framing not concealed by other construction.

B. Dimension Lumber: Lumber of 2 inches nominal (38 mm actual) or greater but less than 5 inches nominal (114 mm actual) in least dimension.

C. Lumber grading agencies, and the abbreviations used to reference them, include the following:
2. NLGA: National Lumber Grades Authority.
3. RIS: Redwood Inspection Service.
5. WCLIB: West Coast Lumber Inspection Bureau.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.
1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
3. For fire-retardant treatments, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5664.
4. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
5. Include copies of warranties from chemical treatment manufacturers for each type of treatment.

B. LEED Submittals:
1. Certificates for Credit MR 7: Chain-of-custody certificates indicating that products specified to be made from certified wood comply with forest certification requirements. Include documentation that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.
2. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
3. Product Data for Credit IEQ 4.4: For composite wood products, documentation indicating that product contains no urea formaldehyde.

1.5 INFORMATIONAL SUBMITTALS

A. Material Certificates: For dimension lumber specified to comply with minimum allowable unit stresses. Indicate species and grade selected for each use and design values approved by the ALSC Board of Review.

B. Evaluation Reports: For the following, from ICC-ES:
1. Wood-preservative-treated wood.
2. Fire-retardant-treated wood.
5. Expansion anchors.
6. Metal framing anchors.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Stack lumber flat with spacers beneath and between each bundle to provide air circulation. Protect lumber from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 WOOD PRODUCTS, GENERAL

A. Certified Wood: Materials shall be produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

B. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
1. Factory mark each piece of lumber with grade stamp of grading agency.
2. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.
3. Provide dressed lumber, S4S, unless otherwise indicated.

C. Maximum Moisture Content of Lumber: 19 percent unless otherwise indicated.

2.2 WOOD-PRESERVATIVE-TREATED LUMBER

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with the ground, Use Category UC3b for exterior construction not in contact with the ground, and Use Category UC4a for items in contact with the ground.
1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.
2. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or that does not comply with requirements for untreated material.

C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.
1. For exposed lumber indicated to receive a stained or natural finish, omit marking and provide certificates of treatment compliance issued by inspection agency.

D. Application: Treat items indicated on Drawings, and the following:
1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
2. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
3. Wood framing and furring attached directly to the interior of below-grade exterior masonry or concrete walls.
4. Wood framing members that are less than 18 inches (460 mm) above the ground in crawlspaces or unexcavated areas.
5. Wood floor plates that are installed over concrete slabs-on-grade.

2.3 FIRE-RETARDANT-TREATED MATERIALS

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this article, that are acceptable to authorities having jurisdiction, and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Lumber and Plywood by Pressure Process: Products with a flame spread index of 25 or less when tested according to ASTM E 84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.
1. Use treatment that does not promote corrosion of metal fasteners.
2. Exterior Type: Treated materials shall comply with requirements specified above for fire-retardant-treated lumber and plywood by pressure process after being subjected to accelerated weathering according to ASTM D 2898. Use for exterior locations and where indicated.
3. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D 3201 at 92 percent relative humidity. Use where exterior type is not indicated.
4. Design Value Adjustment Factors: Treated lumber shall be tested according ASTM D 5664 and design value adjustment factors shall be calculated according to ASTM D 6841.

C. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent.

D. Identify fire-retardant-treated wood with appropriate classification marking of qualified testing agency.
   1. For exposed lumber indicated to receive a stained or natural finish, omit marking and provide certificates of treatment compliance issued by testing agency.

E. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not bleed through, contain colorants, or otherwise adversely affect finishes.

F. Application: Treat all rough carpentry unless otherwise indicated.

2.4 MISCELLANEOUS LUMBER

A. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:
   1. Blocking.
   2. Nailers.
   3. Rooftop equipment bases and support curbs.
   5. Furring.

B. For items of dimension lumber size, provide Construction or No. 2 grade lumber of any species.

C. For concealed boards, provide lumber with 19 percent maximum moisture content and any of the following species and grades:
   1. Mixed southern pine; No. 2 grade; SPIB.
   2. Hem-fir or hem-fir (north); Construction or No. 2 Common grade; NLGA, WCLIB, or WWPA.
   3. Spruce-pine-fir (south) or spruce-pine-fir; Construction or No. 2 Common grade; NeLMA, NLGA, WCLIB, or WWPA.
   4. Eastern softwoods; No. 2 Common grade; NeLMA.
   5. Northern species; No. 2 Common grade; NLGA.
   6. Western woods; Construction or No. 2 Common grade; WCLIB or WWPA.

D. For blocking not used for attachment of other construction, Utility, Stud, or No. 3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with its attachment and purpose.

E. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.

F. For furring strips for installing plywood or hardboard paneling, select boards with no knots capable of producing bent-over nails and damage to paneling.

2.5 PLYWOOD BACKING PANELS

A. Equipment Backing Panels: DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated or, if not indicated, not less than 1/2-inch (13-mm) nominal thickness.
2.6 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.
   1. Where rough carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M.

B. Nails, Brads, and Staples: ASTM F 1667.

D. Wood Screws: ASME B18.6.1.

E. Lag Bolts: ASME B18.2.1 (ASME B18.2.3.8M).

F. Bolts: Steel bolts complying with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and, where indicated, flat washers.

G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry assemblies and equal to four times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing and inspecting agency.

2.7 MISCELLANEOUS MATERIALS

A. Flexible Flashing: Composite, self-adhesive, flashing product consisting of a pliable, butyl rubber or rubberized-asphalt compound, bonded to a high-density polyethylene film, aluminum foil, or spunbonded polyolefin to produce an overall thickness of not less than 0.025 inch (0.6 mm).

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit rough carpentry to other construction; scribe and cope as needed for accurate fit. Locate furring, nailers, blocking, grounds, and similar supports to comply with requirements for attaching other construction.

B. Install plywood backing panels by fastening to studs; coordinate locations with utilities requiring backing panels. Install fire-retardant treated plywood backing panels with classification marking of testing agency exposed to view.

C. Do not splice structural members between supports unless otherwise indicated.

D. Provide blocking and framing as indicated and as required to support facing materials, fixtures, specialty items, and trim.
   1. Provide metal clips for fastening gypsum board or lath at corners and intersections where framing or blocking does not provide a surface for fastening edges of panels. Space clips not more than 16 inches (406 mm) o.c.
E. Sort and select lumber so that natural characteristics will not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.

F. Comply with AWPA M4 for applying field treatment to cut surfaces of preservative-treated lumber.
   1. Use inorganic boron for items that are continuously protected from liquid water.
   2. Use copper naphthenate for items not continuously protected from liquid water.

G. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
   1. NES NER-272 for power-driven fasteners.

H. Use steel common nails unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood. Drive nails snug but do not countersink nail heads unless otherwise indicated.

I. For exposed work, arrange fasteners in straight rows parallel with edges of members, with fasteners evenly spaced, and with adjacent rows staggered.
   1. Comply with approved fastener patterns where applicable. Before fastening, mark fastener locations, using a template made of sheet metal, plastic, or cardboard.
   2. Use finishing nails unless otherwise indicated. Countersink nail heads and fill holes with wood filler.

3.2 WOOD GROUND, SLEEPER, BLOCKING, AND NAILER INSTALLATION

A. Install where indicated and where required for screeding or attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.

B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces unless otherwise indicated.

C. Where wood-preservative-treated lumber is installed adjacent to metal decking, install continuous flexible flashing separator between wood and metal decking.

3.3 WOOD FURRING INSTALLATION

A. Install level and plumb with closure strips at edges and openings. Shim with wood as required for tolerance of finish work.

B. Furring to Receive Plywood or Hardboard Paneling: Install 1-by-3-inch nominal- (19-by-63-mm actual-) size furring horizontally at 24 inches (610 mm) o.c.

C. Furring to Receive Gypsum Board: Install 1-by-2-inch nominal- (19-by-38-mm actual-) size furring vertically at 16 inches (406 mm) o.c.

3.4 PROTECTION

A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.
B. Protect rough carpentry from weather. If, despite protection, rough carpentry becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 06 10 00
SECTION 06 16 00 – SHEATHING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Wall sheathing.
   2. Roof sheathing.
   3. Underlayment.

B. Related Requirements:
   1. Division 06 Section "Rough Carpentry" for plywood backing panels.
   2. Division 07 Section "Fluid-Applied Membrane Air Barrier" for water-resistant barrier applied over wall sheathing.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.
   1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Indicate type of preservative used and net amount of preservative retained.
   2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Include physical properties of treated materials.
   3. For fire-retardant treatments, include physical properties of treated plywood both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5516.
   4. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
   5. Include copies of warranties from chemical treatment manufacturers for each type of treatment.

B. LEED Submittals:
   1. Certificates for Credit MR 7: Chain-of-custody certificates indicating that products specified to be made from certified wood comply with forest certification requirements. Include documentation that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.
   2. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
   3. Product Data for Credit IEQ 4.4: For composite wood products, documentation indicating that product contains no urea formaldehyde.

1.4 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For following products, from ICC-ES:
   1. Preservative-treated plywood.
   2. Fire-retardant-treated plywood.
1.5 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant-treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Stack panels flat with spacers beneath and between each bundle to provide air circulation. Protect sheathing from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: For assemblies with fire-resistance ratings, provide materials and construction identical to those of assemblies tested for fire resistance per ASTM E 119 by a testing and inspecting agency acceptable to authorities having jurisdiction.

2.2 WOOD PANEL PRODUCTS

A. Certified Wood: For the following wood products, provide materials produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship":

1. Plywood.

B. Plywood: Either DOC PS 1 or DOC PS 2 unless otherwise indicated.

C. Thickness: As needed to comply with requirements specified, but not less than thickness indicated.

D. Factory mark panels to indicate compliance with applicable standard.

2.3 PRESERVATIVE-TREATED PLYWOOD

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with the ground, Use Category UC3b for exterior construction not in contact with the ground, and Use Category UC4a for items in contact with the ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.

B. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.

C. Application: Treat items indicated on Drawings and plywood in contact with masonry or concrete or used with roofing, flashing, vapor barriers, and waterproofing.

2.4 FIRE-RETARDANT-TREATED PLYWOOD

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this article that are acceptable to authorities having jurisdiction and with fire-test-
response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Plywood by Pressure Process: Products with a flame-spread index of 25 or less when tested according to ASTM E 84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.

1. Use treatment that does not promote corrosion of metal fasteners.
2. Exterior Type: Treated materials shall comply with requirements specified above for fire-retardant-treated plywood by pressure process after being subjected to accelerated weathering according to ASTM D 2898. Use for exterior locations and where indicated.
3. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D 3201 at 92 percent relative humidity. Use where exterior type is not indicated.
4. Design Value Adjustment Factors: Treated lumber plywood shall be tested according ASTM D 5516 and design value adjustment factors shall be calculated according to ASTM D 6305. Span ratings after treatment shall be not less than span ratings specified. For roof sheathing and where high-temperature fire-retardant treatment is indicated, span ratings for temperatures up to 170 deg F (76 deg C) shall be not less than span ratings specified.

C. Kiln-dry material after treatment to a maximum moisture content of 15 percent. Do not use material that is warped or does not comply with requirements for untreated material.

D. Identify fire-retardant-treated plywood with appropriate classification marking of qualified testing agency.

E. Application: Treat all plywood unless otherwise indicated.

2.5 WALL & SOFFIT SHEATHING

1. Span Rating: Not less than 16/0.
2. Nominal Thickness: Not less than 1/2 inch, or as indicated in Drawings.

B. Glass-Mat Gypsum Wall Sheathing: ASTM C 1177/1177M.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. CertainTeed Corporation; GlasRoc.
   b. G-P Gypsum Corporation; Dens-Glass Gold.
   c. National Gypsum Company; Gold Bond e(2)XP.
   d. Temple-Inland Inc.; GreenGlass
   e. United States Gypsum Co.; Securock.
2. Type and Thickness: Regular, thickness as indicated on Drawings.
3. Size: 48 by 96 inches (1219 by 2438 mm) for vertical installation.

2.6 ROOF UNDERLAYMENT

A. Glass-Mat Gypsum Underlayment: ASTM C 1177/1177M.
1. Basis-of-Design Product: Subject to compliance with requirements, provide “Securock” by United States Gypsum Co., or equal.
   a. Underlayment without facing material is required for best performance of fluid applied membrane in green roof system.
2. Type and Thickness: Regular, thickness as indicated on Drawings.
2.7 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.
   1. For roof and wall sheathing, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M.

B. Nails, Brads, and Staples: ASTM F 1667.

D. Wood Screws: ASME B18.6.1.

E. Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing to be attached, with organic-polymer or other corrosion-protective coating having a salt-spray resistance of more than 800 hours according to ASTM B 117.
   1. For steel framing less than 0.0329 inch (0.835 mm) thick, use screws that comply with ASTM C 1002.
   2. For steel framing from 0.033 to 0.112 inch (0.84 to 2.84 mm) thick, use screws that comply with ASTM C 954.

2.8 SHEATHING JOINT-AND-PENETRATION TREATMENT MATERIALS

A. Sealant for Glass-Mat Gypsum Sheathing: Silicone emulsion sealant complying with ASTM C 834, compatible with sheathing tape and sheathing and recommended by tape and sheathing manufacturers for use with glass-fiber sheathing tape and for covering exposed fasteners.
   1. Sheathing Tape: Self-adhering glass-fiber tape, minimum 2 inches (50 mm) wide, 10 by 10 or 10 by 20 threads/inch (390 by 390 or 390 by 780 threads/m), of type recommended by sheathing and tape manufacturers for use with silicone emulsion sealant in sealing joints in glass-mat gypsum sheathing and with a history of successful in-service use.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of sheathing or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:
   1. NES NER-272 for power-driven fasteners.
   2. Table 2304.9.1, "Fastening Schedule," in ICC's "International Building Code."

D. Use screws unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections. Install fasteners without splitting wood.

E. Coordinate wall sheathing installation with flashing and joint-sealant installation so these materials are installed in sequence and manner that prevent exterior moisture from passing through completed assembly.
F. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

G. Coordinate sheathing installation with installation of materials installed over sheathing so sheathing is not exposed to precipitation or left exposed at end of the workday when rain is forecast.

3.2 GYPSUM SHEATHING INSTALLATION

A. Comply with GA-253 and with manufacturer's written instructions.
   1. Fasten gypsum sheathing to cold-formed metal framing with screws.
   2. Install boards with a 3/8-inch (9.5-mm) gap where non-load-bearing construction abuts structural elements.
   3. Install boards with a 1/4-inch (6.4-mm) gap where they abut masonry or similar materials that might retain moisture, to prevent wicking.

B. Apply fasteners so heads bear tightly against face of sheathing, but do not cut into facing.

C. Horizontal Installation: Install sheathing with V-grooved edge down and tongue edge up. Interlock tongue with groove to bring long edges in contact with edges of adjacent boards without forcing. Abut ends of boards over centers of studs, and stagger end joints of adjacent boards not less than one stud spacing. Attach boards at perimeter and within field of board to each steel stud.
   1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of boards.

D. Vertical Installation: Install board vertical edges centered over studs. Abut ends and edges of each board with those of adjacent boards. Attach boards at perimeter and within field of board to each stud.
   1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of boards.

E. Seal sheathing joints according to sheathing manufacturer's written instructions.
   1. Apply elastomeric sealant to joints and fasteners and trowel flat. Apply sufficient amount of sealant to completely cover joints and fasteners after troweling. Seal other penetrations and openings.
   2. Apply glass-fiber sheathing tape to glass-mat gypsum sheathing joints and apply and trowel silicone emulsion sealant to embed entire face of tape in sealant. Apply sealant to exposed fasteners with a trowel so fasteners are completely covered. Seal other penetrations and openings.

3.3 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.
SECTION 06 40 23 - INTERIOR ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Interior standing and running trim.
   2. Spaced board paneling.
   3. Interior ornamental work.
   4. Wood cabinets.
   5. Solid-surfacing-material countertops.
   6. Closet and utility shelving.
   7. Shop finishing of interior woodwork.
   8. Elm wood from trees on site, provided by Owner. Contractor to provide rough sawing and milling of hardwood to required dimensions, and fabrication of wall paneling and millwork pieces as shown on Drawings.
   9. Phenolic wall and door panels and counters.

B. Related Sections include the following:
   1. Division 06 Section "Rough Carpentry" for wood furring, blocking, shims, and hanging strips required for installing woodwork and concealed within other construction before woodwork installation.

1.3 DEFINITIONS

A. Interior architectural woodwork includes wood furring, blocking, shims, and hanging strips for installing woodwork items unless concealed within other construction before woodwork installation.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated, including cabinet hardware and accessories and finishing materials and processes.

   1. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements.

B. LEED Submittals:

   1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
   2. Certificates for Credit MR 6 Credit MR 7: Chain-of-custody certificates indicating that interior architectural woodwork complies with forest certification requirements. Include
documentation that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.

3. Product Data for Credit IEQ 4.1: For installation adhesives, documentation including printed statement of VOC content.

4. Product Data for Credit IEQ 4.4: For composite wood products and adhesives, documentation indicating that product contains no urea formaldehyde.

C. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.

1. Show details full size.
2. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in other Sections.
3. Show locations and sizes of cutouts and holes for plumbing fixtures, faucets, soap dispensers and other items installed in architectural woodwork.

D. Samples for Initial Selection:

1. Shop-applied transparent finishes.
2. Solid-surfacing materials.

E. Samples for Verification:

1. Lumber with or for transparent finish, not less than 50 sq. in., for each species and cut, finished on 1 side and 1 edge.
2. Veneer-faced panel products with or for transparent finish, 8 by 10 inches, for each species and cut. Include at least one face-veneer seam and finish as specified.
3. Solid-surfacing materials, 6 inches square.
4. Exposed cabinet hardware and accessories, one unit for each type and finish.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and fabricator.

B. Product Certificates: For each type of product, signed by product manufacturer.

C. Woodwork Quality Standard Compliance Certificates: AWI Quality Certification Program certificates.

1.6 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate products similar to those required for this Project and whose products have a record of successful in-service performance. Shop is a certified participant in AWI's Quality Certification Program.

B. Installer Qualifications: Certified participant in AWI's Quality Certification Program.

C. Quality Standard: Unless otherwise indicated, comply with AWI's "Architectural Woodwork Quality Standards" for grades of interior architectural woodwork indicated for construction, finishes, installation, and other requirements.

1. Provide AWI Quality Certification Program labels and certificates indicating that woodwork, including installation, complies with requirements of grades specified.
D. Fire-Test-Response Characteristics: Where fire-retardant materials or products are indicated, provide materials and products with specified fire-test-response characteristics as determined by testing identical products per test method indicated by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify with appropriate markings of applicable testing and inspecting agency in the form of separable paper label or, where required by authorities having jurisdiction, imprint on surfaces of materials that will be concealed from view after installation.

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Required mockups include, but are not limited to:
      a. Lecture Hall fin wall w/aniline dye boards and surrounding acoustic materials, as directed by Architect.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

F. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section “Project Management and Coordination.”

1.7 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver woodwork until painting and similar operations that could damage woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas where environmental conditions comply with requirements specified in “Project Conditions” Article.

1.8 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install woodwork until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

B. Field Measurements: Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
   1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed, and indicate measurements on Shop Drawings.
   2. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating woodwork without field measurements. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.9 COORDINATION

A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that interior architectural woodwork can be supported and installed as indicated.
PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Provide materials that comply with requirements of AWI's quality standard for each type of woodwork and quality grade specified, unless otherwise indicated.

B. Certified Wood: Interior architectural woodwork shall be produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

C. Wood Species for Opaque Finish: Any closed-grain hardwood.

D. Wood Products: Comply with the following:

1. Recycled Content of Medium-Density Fiberboard and Particleboard: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 50% percent.
4. Particleboard: ANSI A208.1, Grade M-2, made with binder containing no urea formaldehyde.
5. Particleboard: Straw-based particleboard complying with requirements in ANSI A208.1, Grade M-2, except for density.

E. Solid-Surfacing Material: Homogeneous solid sheets of filled plastic resin complying with ISSFA-2.

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   b. Formica Corporation.
   c. Nevamar Company, LLC; Decorative Products Div.
   d. Wilsonart International; Div. of Premark International, Inc.

2. Type: Standard type, unless Special Purpose type is indicated.
3. Colors and Patterns: As selected by Architect from manufacturer's full range of standard and premium options.

F. Phenolic Panel: Flat panel based on thermosetting resins, homogeneously reinforced with cellulose fibers and manufactured under high pressure and temperature, with a pigmented resin surface.

1. Basis of Design: Subject to requirements, provide 'Athlon' panel as manufactured by Trespa North America, or approved equal.
   a. Panel Core: Type FR fire retardant black core.
   b. Panel Thickness: 3/8” thick for wall panels; ½” thick for door panels and counters.
   c. Finish: Satin sheen.
   d. Color: To be selected by Architect from range of manufacturer's standard and premium colors and finishes.
   e. Number of Colors: Five colors and finishes will be used.
   g. Corner Profile: Sharp corners, no radius.
2.2 FIRE-RETARDANT-TREATED MATERIALS

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this Article, that are acceptable to authorities having jurisdiction, and with fire-test-response characteristics specified.

1. Do not use treated materials that do not comply with requirements of referenced woodworking standard or that are warped, discolored, or otherwise defective.
2. Use fire-retardant-treatment formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants to distinguish treated materials from untreated materials.
3. Identify fire-retardant-treated materials with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.

B. Fire-Retardant-Treated Lumber and Plywood by Pressure Process: Comply with performance requirements of AWPA C20 (lumber) and AWPA C27 (plywood). Use the following treatment type:

2. Interior Type A: Low-hygroscopic formulation.
3. Mill lumber after treatment within limits set for wood removal that do not affect listed fire-test-response characteristics, using a woodworking plant certified by testing and inspecting agency.
4. Mill lumber before treatment and implement special procedures during treatment and drying processes that prevent lumber from warping and developing discolorations from drying sticks or other causes, marring, and other defects affecting appearance of treated woodwork.
5. Kiln-dry materials before and after treatment to levels required for untreated materials.

C. Fire-Retardant Particleboard: Panels complying with the following requirements, made from softwood particles and fire-retardant chemicals mixed together at time of panel manufacture to achieve flame-spread index of 25 or less and smoke-developed index of 25 or less per ASTM E 84.

1. For panels 3/4 inch thick and less, comply with ANSI A208.1 for Grade M-2 except for the following minimum properties: modulus of rupture, 1600 psi; modulus of elasticity, 300,000 psi; internal bond, 80 psi; and screw-holding capacity on face and edge, 250 and 225 lbf, respectively.
2. For panels 13/16 to 1-1/4 inches thick, comply with ANSI A208.1 for Grade M-1 except for the following minimum properties: modulus of rupture, 1300 psi; modulus of elasticity, 250,000 psi; linear expansion, 0.50 percent; and screw-holding capacity on face and edge, 250 and 175 lbf, respectively.
3. Product: Subject to compliance with requirements, provide "Duraflake FR" by Weyerhaeuser.

D. Fire-Retardant Fiberboard: Medium-density fiberboard panels complying with ANSI A208.2, made from softwood fibers, synthetic resins, and fire-retardant chemicals mixed together at time of panel manufacture to achieve flame-spread index of 25 or less and smoke-developed index of 200 or less per ASTM E 84.

1. Product: Subject to compliance with requirements, provide "Medite FR" by SierraPine Ltd.; Medite Div.

2.3 CABINET HARDWARE AND ACCESSORIES

A. General: Provide cabinet hardware and accessory materials associated with architectural cabinets, except for items specified in Division 08 Section "Door Hardware."

B. Frameless Concealed Hinges (European Type): BHMA A156.9, B01602, 170 degrees of opening, self-closing.
C. Cabinet Pulls: The following cabinet pulls are incorporated into the scope of the project and distinguished graphically in the Drawings:
1. Wire Pulls: Back mounted, solid stainless steel, 5 inches long, 2-1/2 inches deep, and 5/16 inch in diameter, satin finish.

D. Catches: Push-in magnetic catches, BHMA A156.9, B03131.

E. Shelf Rests: BHMA A156.9, B04013; metal, two-pin type.

F. Drawer Slides: BHMA A156.9, B05091.
1. Heavy Duty (Grade 1HD-100 and Grade 1HD-200): Side mounted; full-overtravel-extension type; zinc-plated steel ball-bearing slides.

G. Sliding Shutter System: Pocket Door System as manufactured by Hafele, Model 1332 – Accuride.
1. Door thickness: ¾”.
2. Lengths to suit cabinet depths shown on Drawings.

H. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated.
1. Satin Chromium Plated: BHMA 626 for brass or bronze base; BHMA 652 for steel base.
2. Satin Stainless Steel: BHMA 630.

I. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements in BHMA A156.9.

J. Sliding Door Fitting: Pocket Door System as manufactured by Hafele, Model HAWA-Junior 80/B.

K. Sliding Door Fitting: Pocket Door System as manufactured by Hafele, Model HAWA-Lower Guides/Sealing and Buffer Profile.

2.4 MISCELLANEOUS MATERIALS

A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln dried to less than 15 percent moisture content.

B. Furring, Blocking, Shims, and Hanging Strips: Fire-retardant-treated softwood lumber, kiln dried to less than 15 percent moisture content.

C. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

D. Adhesives, General: Adhesives shall not contain urea formaldehyde.

E. VOC Limits for Installation Adhesives: Installation adhesives shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
1. Wood Glues: 30 g/L.
2. Multipurpose Construction Adhesives: 70 g/L.
3. Contact Adhesive: 250 g/L.
2.5 FABRICATION, GENERAL

A. Interior Woodwork Grade: Unless otherwise indicated, provide Premium-grade interior woodwork complying with referenced quality standard.

B. Wood Moisture Content: Comply with requirements of referenced quality standard for wood moisture content in relation to ambient relative humidity during fabrication and in installation areas.

C. Sand fire-retardant-treated wood lightly to remove raised grain on exposed surfaces before fabrication.

D. Fabricate woodwork to dimensions, profiles, and details indicated. Ease edges to radius indicated for the following:

E. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
   1. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements indicated on Shop Drawings before disassembling for shipment.

F. Shop-cut openings to maximum extent possible to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.
   1. Seal edges of openings in countertops with a coat of varnish.

2.6 INTERIOR STANDING AND RUNNING TRIM FOR TRANSPARENT FINISH

A. Grade: Premium.

B. Wood Species and Cut: Cherry, plain sawn.

   1. Provide split species on trim that faces areas with different wood species, matching each face of woodwork to species and cut of finish wood surfaces in areas finished.

C. Backout or groove backs of flat trim members and kerf backs of other wide, flat members, except for members with ends exposed in finished work.

2.7 INTERIOR STANDING AND RUNNING TRIM FOR OPAQUE FINISH

A. Grade: Premium.

B. Wood Species: Any closed-grain hardwood.

C. Backout or groove backs of flat trim members and kerf backs of other wide, flat members, except for members with ends exposed in finished work.
2.8 SPACED BOARD PANELING

A. Grade: Premium.

B. Wood Species and Cut:

1. Plain sawn cherry – locations as indicated on the Drawings.
2. Plain sawn elm – locations as indicated on the Drawings.

C. Built-Up Elm Board Panel: Where the note "Built-Up Elm Board Panel" appears on the Drawings, it refers to individual solid elm boards joined to create a flush-faced solid panel. All methods for concealed joining of solid boards shall be in accordance with AWI Architectural Woodwork Quality Standards and submitted for review as part of the shop drawing review process. [C]

D. Matching of Adjacent Veneer Leaves: Slip match.

E. Veneer Matching within Panel Face: Balance match.

F. Panel-Matching Method: No matching between panels is required. Select and arrange panels for similarity of grain pattern and color between adjacent panels.

G. Fire-Retardant-Treated Board Paneling: Provide panels consisting of wood veneer and fire-retardant particleboard or fire-retardant medium-density fiberboard. Panels shall have flame-spread index of 75 or less and smoke-developed index of 450 or less per ASTM E 84.

2.9 WOOD CABINETS FOR TRANSPARENT FINISH

A. Grade: Premium.

B. AWI Type of Cabinet Construction: Flush overlay.

C. Wood Species and Cut for Exposed Surfaces:

1. Cherry, plain sawn or sliced.
2. Elm, plain sawn or sliced.

D. Semiexposed Surfaces: Provide surface materials indicated below:

1. Surfaces Other Than Drawer Bodies: Same species and cut indicated for exposed surfaces.
2. Drawer Sides and Backs: Solid-hardwood lumber, stained to match species indicated for exposed surfaces.
3. Drawer Bottoms: Hardwood plywood.

2.10 SOLID-SURFACING-MATERIAL COUNTERTOPS

A. Grade: Premium.

B. Solid-Surfacing-Material Thickness: Provide manufacture's standard thickness that will allow Architect to select from manufacture's full range of color, but not less than 3/4 inch. [C]
C. Colors, Patterns, and Finishes: Provide materials and products that result in colors of solid-surfacing material complying with the following requirements:

1. As selected by Architect from manufacturer's full range.

D. Fabricate tops in one piece, unless otherwise indicated. Comply with solid-surfacing-material manufacturer's written recommendations for adhesives, sealers, fabrication, and finishing.

1. Fabricate tops with loose backsplashes for field application.

E. Install integral sink bowls in countertops in shop.

F. Drill holes in countertops for plumbing fittings and soap dispensers in shop.

2.11 CLOSET AND UTILITY SHELVING

A. Grade: Premium.

B. Shelf Material: 3/4-inch veneer-faced panel product with veneer edge banding.

C. Wood Species: Plain sliced cherry.

2.12 SHOP FINISHING

A. Grade: Provide finishes of same grades as items to be finished.

B. General: Shop finish transparent-finished interior architectural woodwork at fabrication shop as specified in this Section. Refer to Division 09 painting Sections for finishing opaque-finished architectural woodwork.

C. Finishing Materials: Products shall comply with the testing and product requirements of the California Department of Health Services "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

D. Shop Priming: Shop apply the prime coat including backpriming, if any, for items specified to be field finished. Refer to Division 09 painting Sections for material and application requirements.

E. Preparation for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces, and similar preparations for finishing architectural woodwork, as applicable to each unit of work.

1. Backpriming: Apply one coat of sealer or primer, compatible with finish coats, to concealed surfaces of woodwork. Apply two coats to back of paneling and to end-grain surfaces.

F. Transparent Finish:

1. Grade: Premium.
2. AWI Finish System for clear finish: Acrylic Lacquer.
3. AWI Finish System for stained finish: Aniline Dye with Acrylic Lacquer.
5. Stain Colors: One color will be used.
6. Wash Coat for Stained Finish: Apply wash-coat sealer to woodwork made from closed-grain wood before staining and finishing.
7. Sheen: Satin, 31-45 gloss units measured on 60-degree gloss meter per ASTM D 523.
PART 3 - EXECUTION

3.1 PREPARATION

A. Before installation, condition woodwork to average prevailing humidity conditions in installation areas.

B. Before installing architectural woodwork, examine shop-fabricated work for completion and complete work as required, including removal of packing and backpriming.

3.2 INSTALLATION

A. Grade: Install woodwork to comply with requirements for the same grade specified in Part 2 for fabrication of type of woodwork involved.

B. Assemble woodwork and complete fabrication at Project site to comply with requirements for fabrication in Part 2, to extent that it was not completed in the shop.

C. Install woodwork level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb (including tops) to a tolerance of 1/8 inch in 96 inches.

D. Scribe and cut woodwork to fit adjoining work, refinish cut surfaces, and repair damaged finish at cuts.

E. Fire-Retardant-Treated Wood: Handle, store, and install fire-retardant-treated wood to comply with chemical treatment manufacturer's written instructions, including those for adhesives used to install woodwork.

F. Anchor woodwork to anchors or blocking built in or directly attached to substrates. Secure with countersunk, concealed fasteners and blind nailing as required for complete installation. Use fine finishing nails or finishing screws for exposed fastening, countersunk and filled flush with woodwork and matching final finish if transparent finish is indicated.

G. Standing and Running Trim: Install with minimum number of joints possible, using full-length pieces (from maximum length of lumber available) to greatest extent possible. Do not use pieces less than 96 inches long, except where shorter single-length pieces are necessary. Scarf running joints and stagger in adjacent and related members.

1. Fill gaps, if any, between top of base and wall with plastic wood filler, sand smooth, and finish same as wood base if finished.
2. Install wall railings on indicated metal brackets securely fastened to wall framing.
3. Install standing and running trim with no more variation from a straight line than 1/8 inch in 96 inches.

H. Cabinets: Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.

1. Install cabinets with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
2. Maintain veneer sequence matching of cabinets with transparent finish.
3. Fasten wall cabinets through back, near top and bottom, at ends and not more than 16 inches o.c. with No. 10 wafer-head sheet metal screws through metal backing or metal framing behind wall finish.
I. Countertops: Anchor securely by screwing through corner blocks of base cabinets or other supports into underside of countertop.

1. Align adjacent solid-surfacing-material countertops and form seams to comply with manufacturer's written recommendations using adhesive in color to match countertop. Carefully dress joints smooth, remove surface scratches, and clean entire surface.
2. Install countertops with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
3. Secure backsplashes to tops with concealed metal brackets at 16 inches o.c. and to walls with adhesive.
4. Calk space between backsplash and wall with sealant specified in Division 07 Section "Joint Sealants."

J. Phenolic Panels: Install as indicated on Drawings. All fasteners to be concealed.

K. Touch up finishing work specified in this Section after installation of woodwork. Fill nail holes with matching filler where exposed.

L. Refer to Division 09 Sections for final finishing of installed architectural woodwork not indicated to be shop finished.

3.3 ADJUSTING AND CLEANING

A. Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.

B. Clean, lubricate, and adjust hardware.

C. Clean woodwork on exposed and semiexposed surfaces. Touch up shop-applied finishes to restore damaged or soiled areas.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 06 40 23
SECTION 07 11 00 – SHEET MEMBRANE WATERPROOFING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this section.

1.2 SECTION INCLUDES

A. Self-adhesive elastomeric sheet membrane waterproofing.

1.3 RELATED SECTIONS

A. Section 02223 - Backfilling.
B. Section 03300 – Cast-in-Place Concrete.
C. Section 07900 – Joint Sealers.

1.4 REFERENCES

C. ANSI/ASTM D 746 – Brittleness Temperature of Plastics and Elastomers by Impact.
D. ASTM D 1004 – Initial Tear Resistance of Plastic Film and Sheeting.

1.5 SUBMITTALS

A. Submit Shop Drawings: Indicate special joint or termination conditions and conditions of interface with other materials.
B. Product Data: Provide data for surface conditioner, flexible flashings, joint cover sheet, and joint and crack sealants, with temperature range for application of waterproofing membrane.
C. Manufacturer’s Installation Instructions: Indicate special procedures and perimeter conditions requiring special attention.
D. Manufacturer’s Certificate: Certify that Products meet or exceed specified requirements.

1.6 QUALITY ASSURANCE
A. Perform work in accordance with NRCA Waterproofing Manual.

1.7 QUALIFICATIONS

A. Membrane Manufacturer: Company specializing in waterproofing sheet membranes with 3 years of experience.

B. Applicator: Company specializing in performing the work of this section approved by manufacturer.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Maintain ambient temperatures above 40º F for 24 hours before and during application and until liquid or mastic accessories have cured.

1.9 WARRANTY

A. Provide 5-year warranty.

B. Warranty: Include coverage for waterproofing failing to resist penetration of water, except where such failures are the result of structural failures of building. Hairline cracking of concrete due to temperature change or shrinkage is not considered a structural failure.

C. For warranty repair work, be responsible for moving and replacing materials concealing waterproofing.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Polyken – Product 660.

B. Or equal approved by the Engineer/Owner’s Representative.

2.2 MEMBRANE MATERIALS

A. Plastic Membrane: Composite sheet of polyethylene backing and butyl rubber with self-adhering adhesive and cold temperature flexibility and adhesion.

B. Membrane 60 mils thick; 36-inch-wide roll, conforming to the following criteria:

<table>
<thead>
<tr>
<th>Properties</th>
<th>Test</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>ASTM D 412</td>
<td>500 min.</td>

<tr>
<td>Moisture Vapor</td>
<td>ASTM E 96</td>
<td>0.8 perms</td>
</tr>
</tbody>
</table>
C. Seaming Materials: As recommended by membrane manufacturer.
D. Flexible Flashings: As recommended by membrane manufacturer.

2.3 ADHESIVE MATERIALS
A. Surface Conditioner: As recommended by membrane manufacturer.
B. Adhesives: As recommended by membrane manufacturer.
C. Thinner and Cleaner: As recommended by adhesive manufacturer, compatible with sheet membrane.

2.4 ATTACHMENT MATERIALS
A. Reglet Strip Devices: See Section 03300: Cast-in-Place Concrete.

2.5 ACCESSORIES
A. Sealant: As recommended by membrane manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Verify substrate surfaces are durable; free or matter detrimental to adhesion or application of waterproofing system.
B. Verify items which penetrate surfaces to receive waterproofing are securely installed.

3.2 PREPARATION
A. Protect adjacent surfaces not designated to receive waterproofing.
B. Clean and prepare surfaces to receive waterproofing in accordance with manufacturer’s instructions. Vacuum substrate clean.
C. Do not apply waterproofing to surfaces unacceptable to manufacturer or applicator.
D. Seal cracks and joints with sealant materials using depth to widen ratio as recommended by sealant manufacturer.
E. Apply surface conditioner at a rate recommended by manufacturer. Protect conditioner from rain or frost until dry.

3.3 INSTALLATION
A. Install membrane waterproofing in accordance with manufacturer’s instructions.
B. Roll out membrane. Minimize wrinkles and bubbles.
C. Remove release paper layer. Roll out on substrate with a mechanical roller to encourage full contact bond.
D. Lap sides and ends in accordance with membrane manufacturer’s instructions.

E. Overlap edges and ends and seal with contact adhesive, minimum 6 inches. Seal permanently waterproof. Apply uniform bead of sealant to joint edge.

F. Reinforce membrane with multiple thicknesses of membrane material over joints, whether joints are static or moving.

G. Weather lap joints on sloped substrate in direction of drainage. Seal joints and seams.

H. Install flexible flashings. Seal watertight to membrane.

I. Seal membrane and flashings to adjoining surfaces.

J. Extend membrane minimum of 6 inches onto vertical surfaces.

K. Seal items penetrating membrane and install counter flashing membrane material.

3.4 PROTECTION OF FINISHED WORK

A. Protect finished work.

B. Do not permit traffic over unprotected or uncovered membrane.

END OF SECTION 07 11 00
SECTION 07 13 26 - SELF-ADHERING SHEET WATERPROOFING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Modified bituminous sheet waterproofing.
      2. Insulation drainage panels for vertical wall applications.

1.3 PREINSTALLATION MEETINGS
   A. Preinstallation Conference: Conduct conference at Project site.
      1. Review waterproofing requirements including surface preparation, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of product.
      1. Include construction details, material descriptions, and tested physical and performance properties of waterproofing.
      2. Include manufacturer’s written instructions for evaluating, preparing, and treating substrate.
   B. LEED Submittals:
      1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regional materials, certificates indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating distance to Project, cost for each regional material, and fraction by weight that is considered regional.
   C. Shop Drawings: Show locations and extent of waterproofing and details of substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
   D. Samples: For each exposed product and for each color and texture specified, including the following products:
      1. 8-by-8-inch (200-by-200-mm) square of waterproofing and flashing sheet.

1.5 INFORMATIONAL SUBMITTALS
   A. Qualification Data: For Installer.
   B. Field quality-control reports.
   C. Sample Warranties: For special warranties.
1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by waterproofing manufacturer.

B. Mockups: Build mockups to verify selections made under Sample submittals and to set quality standards for installation.
   1. Build for each typical waterproofing installation including accessories to demonstrate surface preparation, crack and joint treatment, corner treatment, and protection.
      a. Size: 100 sq. ft. in area.
      b. Description: Each type of wall installation.
   2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 FIELD CONDITIONS

A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.
   1. Do not apply waterproofing in snow, rain, fog, or mist.

B. Maintain adequate ventilation during preparation and application of waterproofing materials.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer's standard materials-only warranty in which manufacturer agrees to furnish replacement waterproofing material for waterproofing that does not comply with requirements or that fails to remain watertight within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

B. Installer's Special Warranty: Specified form, signed by Installer, covering Work of this Section, for warranty period of two years.
   1. Warranty includes removing and reinstalling protection board, drainage panels, insulation, lawn, landscape features and terrace paving.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Source Limitations for Waterproofing System: Obtain waterproofing materials from single source from single manufacturer.

2.2 MODIFIED BITUMINOUS SHEET WATERPROOFING

A. Modified Bituminous Sheet: Minimum 60-mil (1.5-mm) nominal thickness, self-adhering sheet consisting of 56 mils (1.4 mm) of rubberized asphalt laminated on one side to a 4-mil- (0.10-mm-) thick, polyethylene-film reinforcement, and with release liner on adhesive side; formulated for application with primer or surface conditioner that complies with VOC limits of authorities having jurisdiction.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   2. Physical Properties:
a. Tensile Strength, Membrane: 325 psi (2240 kPa) minimum; ASTM D 412, Die C, modified.
b. Ultimate Elongation: 300 percent minimum; ASTM D 412, Die C, modified.
c. Low-Temperature Flexibility: Pass at minus 20 deg F (minus 29 deg C); ASTM D 1970.
d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch (3-mm) movement; ASTM C 836.
e. Puncture Resistance: 40 lbf (180 N) minimum; ASTM E 154.
f. Water Absorption: 0.2 percent weight-gain maximum after 48-hour immersion at 70 deg F (21 deg C); ASTM D 570.
g. Water Vapor Permeance: 0.05 perms (2.9 ng/Pa x s x sq. m) maximum; ASTM E 96/E 96M, Water Method.
h. Hydrostatic-Head Resistance: 231 feet (70 m) minimum; ASTM D 5385.

2.3 AUXILIARY MATERIALS

A. General: Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.
   1. Furnish liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.

B. Primer: Liquid waterborne primer recommended for substrate by sheet-waterproofing material manufacturer.

C. Surface Conditioner: Liquid, waterborne surface conditioner recommended for substrate by sheet-waterproofing material manufacturer.

D. Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, of trowel grade or low viscosity.

E. Substrate Patching Membrane: Low-viscosity, two-component, modified asphalt coating.

F. Metal Termination Bars: Aluminum bars, approximately 1 by 1/8 inch (25 by 3 mm) thick, predrilled at 9-inch (229-mm) centers.

2.4 INSULATION DRAINAGE PANELS

A. This product intended for vertical application against below grade walls.

B. Geotextile-Faced, Wall-Insulation Drainage Panels: Extruded-polystyrene board insulation complying with ASTM C 578, Type VI, 40-psi (276-kPa) minimum compressive strength; fabricated with tongue-and-groove edges and with one side having grooved drainage channels faced with nonwoven geotextile filter fabric.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Owens Corning Insulating Systems LLC; Insul-Drain.
      b. T. Clear Corporation, a subsidiary of Fin Pan Inc.; Thermadry 1250.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the waterproofing.
1. Verify that concrete has cured and aged for minimum time period recommended in writing by waterproofing manufacturer.
2. Verify that substrate is visibly dry and within the moisture limits recommended in writing by manufacturer. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
3. Verify that compacted subgrade is dry, smooth, sound, and ready to receive waterproofing sheet.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

A. Clean, prepare, and treat substrates according to manufacturer's written instructions. Provide clean, dust-free, and dry substrates for waterproofing application.
B. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.
C. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
D. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
E. Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4258.
1. Install sheet strips of width according to manufacturer's written instructions and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch (1.6 mm).
F. Bridge and cover isolation joints, expansion joints and discontinuous deck-to-wall and deck-to-deck joints with overlapping sheet strips of widths according to manufacturer's written instructions.
1. Invert and loosely lay first sheet strip over center of joint. Firmly adhere second sheet strip to first and overlap to substrate.
G. Corners: Prepare, prime, and treat inside and outside corners according to ASTM D 6135.
1. Install membrane strips centered over vertical inside corners. Install 3/4-inch (19-mm) fillets of liquid membrane on horizontal inside corners and as follows:
a. At footing-to-wall intersections, extend liquid membrane in each direction from corner or install membrane strip centered over corner.
H. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through waterproofing and at drains and protrusions according to ASTM D 6135.

3.3 MODIFIED BITUMINOUS SHEET-WATERPROOFING APPLICATION

A. Install modified bituminous sheets according to waterproofing manufacturer's written instructions and recommendations in ASTM D 6135.
B. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.
C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch- (64-mm-) minimum lap widths and end laps. Overlap and seal seams, and stagger end laps to ensure watertight installation.
1. When ambient and substrate temperatures range between 25 and 40 deg F (minus 4 and plus 5 deg C), install self-adhering, modified bituminous sheets produced for low-temperature
application. Do not use low-temperature sheets if ambient or substrate temperature is higher than 60 deg F (16 deg C).

D. Apply continuous sheets over already-installed sheet strips, bridging substrate cracks, construction, and contraction joints.

E. Seal edges of sheet-waterproofing terminations with mastic.

F. Install sheet-waterproofing and auxiliary materials to tie into adjacent waterproofing.

G. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with sheet waterproofing extending 6 inches (150 mm) beyond repaired areas in all directions.

3.4 INSULATION AND INSULATION DRAINAGE-PANEL INSTALLATION

A. Install insulation drainage panels over waterproofed surfaces; cut and fit to within 3/4 inch (19 mm) of projections and penetrations.

B. Ensure that drainage channels are aligned and free of obstructions.

C. On vertical surfaces, set insulation drainage panels in adhesive or tape applied according to manufacturer's written instructions.

3.5 FIELD QUALITY CONTROL

A. Owner will engage a site representative qualified by waterproofing membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to furnish daily reports to Architect.

B. Prepare test and inspection reports.

3.6 PROTECTION, REPAIR, AND CLEANING

A. Protect waterproofing from damage and wear during remainder of construction period.

B. Protect installed insulation drainage panels from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

C. Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.

D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

3.7 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:

1. Aluminum
2. Plastic Materials and Gaskets
3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 13 26
SECTION 07 21 00 - THERMAL INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Foam-plastic board insulation.
   2. Glass-fiber blanket insulation.
   4. Spray polyurethane foam insulation.

B. Related Sections:
   1. Division 04 Section "Unit Masonry" for insulation installed in cavity walls and masonry cells.
   2. Division 07 Section "Self-Adhering Sheet Waterproofing" for insulation panels and insulated drainage panels installed with waterproofing.
   3. Division 07 Sections "Ethylene-Propylene-Diene-Monomer (EPDM) Roofing" and "Garden Roof System" for insulation specified as part of roofing construction.
   4. Division 07 Section "Fire-Resistive Joint Systems" for insulation installed as part of a perimeter fire-resistive joint system.
   5. Division 09 Section "Gypsum Board" for sound attenuation insulation in gypsum board assemblies.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. LEED Submittals:
   1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

1.4 INFORMATIONAL SUBMITTALS

A. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.

B. Research/Evaluation Reports: For foam-plastic insulation, from ICC-ES.

1.5 QUALITY ASSURANCE

A. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
1.6 DELIVERY, STORAGE, AND HANDLING

A. Protect insulation materials from physical damage and from deterioration due to moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

B. Protect foam-plastic board insulation as follows:
1. Do not expose to sunlight except to necessary extent for period of installation and concealment.
2. Protect against ignition at all times. Do not deliver foam-plastic board materials to Project site before installation time.
3. Quickly complete installation and concealment of foam-plastic board insulation in each area of construction.

PART 2 - PRODUCTS

2.1 FOAM-PLASTIC BOARD INSULATION

A. Extruded-Polystyrene Board Insulation: ASTM C 578, of type and minimum compressive strength indicated below, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E 84.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Dow Chemical Company (The).
      b. Owens Corning.
   2. Type IV, 25 psi (173 kPa).
   3. Provide boards with thermal resistance indicated:
      a. 5.6 deg F x h x sq. ft./Btu x in. at 75 deg F per inch of thickness
   4. Thickness: 2” unless otherwise noted.

B. Foil-Faced and Unfaced, Polyisocyanurate Board Insulation: ASTM C 1289, Type I, Class 1 or Class 2, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E 84.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      b. Dow Chemical Company (The).
      c. Rmax, Inc.
   2. Where polyisocyanurate board insulation is indicated in horizontal applications, provide total thickness indicated in two layers with staggered joints. Provide foil faced insulation at layer with foil facing the conditioned side of the building envelope. Install the unfaced layer on the unconditioned side of the building envelope.
   3. Provide boards with thermal resistances indicated:
      a. 6.5 deg F x h x sq. ft./Btu x in. at 75 deg F per inch of thickness

C. Adhesive for Bonding Insulation: Product with demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates.

2.2 GLASS-FIBER BLANKET INSULATION

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. CertainTeed Corporation.
   2. Guardian Building Products, Inc.
5. Owens Corning.

B. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 50 percent.

C. Unfaced, Glass-Fiber Blanket Insulation: ASTM C 665, Type I; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E 84; passing ASTM E 136 for combustion characteristics.

D. Reinforced-Foil-Faced, Glass-Fiber Blanket Insulation: ASTM C 665, Type III (reflective faced), Class A (faced surface with a flame-spread index of 25 or less); Category 1 (membrane is a vapor barrier), faced with foil scrim, foil-scrim kraft, or foil-scrim polyethylene.

E. Sustainability Requirements: Provide glass-fiber blanket insulation as follows:
   1. Free of Formaldehyde: Insulation manufactured with 100 percent acrylic binders and no formaldehyde.
   2. Low Emitting: Insulation tested according to ASTM D 5116 and shown to emit less than 0.05-ppm formaldehyde.

2.3 MINERAL-WOOL BLANKET INSULATION

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Fibrex Insulations Inc.
   2. Owens Corning.
   3. Roxul Inc.
   4. Thermafiber.

B. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 50 percent.

C. Unfaced, Mineral-Wool Blanket Insulation: ASTM C 665, Type I (blankets without membrane facing); consisting of fibers; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E 84; passing ASTM E 136 for combustion characteristics.

2.4 SPRAY POLYURETHANE FOAM INSULATION

A. Closed-Cell Polyurethane Foam Insulation: ASTM C 1029, Type II, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E 84.
   1. Basis of Design Product: Subject to compliance with requirements, provide Tiger Foam Insulation, A Commercial Thermal Solution Company, 800.664.0063, or approved equal
      a. Two-part fire retardant semi-rigid closed-cell foam.
      b. ASTM E-84 Class 1 approval.
      c. Flame Spread = 25.
      d. Smoke Developed = 200.
      e. ODP (Ozone-Depletion Potential): Contains non-ozone-depleting, non-flammable HRC propellant.
      f. Not resistant to UV light and must be painted, coated or covered if exposed to direct sunlight after application.
      g. Density: 1.75 lbs/sq ft.
      h. R-Value: 6.2-7.4 per inch.
2.5 INSULATION FASTENERS

A. Adhesively Attached, Spindle-Type Anchors: Plate welded to projecting spindle; capable of holding insulation of specified thickness securely in position indicated with self-locking washer in place.
   1. Plate: Perforated, galvanized carbon-steel sheet, 0.030 inch (0.762 mm) thick by 2 inches (50 mm) square.
   2. Spindle: Copper-coated, low-carbon steel; fully annealed; 0.105 inch (2.67 mm) in diameter; length to suit depth of insulation indicated.

B. Adhesively Attached, Angle-Shaped, Spindle-Type Anchors: Angle welded to projecting spindle; capable of holding insulation of specified thickness securely in position indicated with self-locking washer in place.
   1. Angle: Formed from 0.030-inch- (0.762-mm-) thick, perforated, galvanized carbon-steel sheet with each leg 2 inches (50 mm) square.
   2. Spindle: Copper-coated, low-carbon steel; fully annealed; 0.105 inch (2.67 mm) in diameter; length to suit depth of insulation indicated.

C. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- (0.41-mm-) thick galvanized-steel sheet, with beveled edge for increased stiffness, sized as required to hold insulation securely in place, but not less than 1-1/2 inches (38 mm) square or in diameter.
   1. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap.

D. Anchor Adhesive: Product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean substrates of substances that are harmful to insulation or vapor retarders, including removing projections capable of puncturing vapor retarders, or that interfere with insulation attachment.

3.2 INSTALLATION, GENERAL

A. Comply with insulation manufacturer's written instructions applicable to products and applications indicated.

B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

C. Extend insulation to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

D. Provide sizes to fit applications indicated and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units to produce thickness indicated unless multiple layers are otherwise shown or required to make up total thickness.

3.3 INSTALLATION OF BELOW-GRADE INSULATION

1. See Division 07 Section "Self-Adhering Sheet Waterproofing" for insulation panels and insulated drainage panels installed with waterproofing.

3.4 INSTALLATION OF CAVITY-WALL INSULATION

1. See Division 04 Section "Unit Masonry" for insulation installed in cavity walls and masonry cells.
3.5 INSTALLATION OF INSULATION FOR FRAMED CONSTRUCTION

A. Apply insulation units to substrates by method indicated, complying with manufacturer's written instructions. If no specific method is indicated, use mechanical anchorage to provide permanent placement and support of units.

B. Glass-Fiber or Mineral-Wool Blanket Insulation: Install in cavities formed by framing members according to the following requirements:
   1. Use insulation widths and lengths that fill the cavities formed by framing members. If more than one length is required to fill the cavities, provide lengths that will produce a snug fit between ends.
   2. Place insulation in cavities formed by framing members to produce a friction fit between edges of insulation and adjoining framing members.
   3. Maintain 3-inch (76-mm) clearance of insulation around recessed lighting fixtures not rated for or protected from contact with insulation.
   4. For metal-framed wall cavities where cavity heights exceed 96 inches (2438 mm), support unfaced blankets mechanically and support faced blankets by taping flanges of insulation to flanges of metal studs.
   5. Vapor-Retarder-Faced Blankets: Tape joints and ruptures in vapor-retarder facings, and seal each continuous area of insulation to ensure airtight installation.
      a. Exterior Walls: Set units with facing placed toward interior of construction.

C. Foam-Plastic Board Insulation: Seal joints between units by applying adhesive, mastic, or sealant to edges of each unit to form a tight seal.

D. Miscellaneous Voids: Install insulation in miscellaneous voids and cavity spaces where required to prevent gaps in insulation using the following materials:
   1. Spray Polyurethane Insulation: Apply according to manufacturer's written instructions.

3.6 INSTALLATION OF INSULATION IN CEILINGS FOR SOUND ATTENUATION

A. Where mineral-wool blankets are indicated for sound attenuation above ceilings, install blanket insulation over entire ceiling area in thicknesses indicated. Extend insulation 48 inches (1219 mm) up either side of partitions.

3.7 INSTALLATION OF SPINDLE ATTACHED INSULATION

A. Install board insulation by adhesively attached, spindle-type insulation anchors as follows:
   1. Fasten insulation anchors to substrates with insulation anchor adhesive according to anchor manufacturer's written instructions. Space anchors according to insulation manufacturer's written instructions for insulation type, thickness, and application indicated.
   2. After adhesive has dried, install board insulation by pressing insulation into position over spindles and securing it tightly in place with insulation-retaining washers, taking care not to compress insulation below indicated thickness.
   3. Where insulation will not be covered by other building materials, apply capped washers to tips of spindles.

3.8 INSTALLATION OF CURTAIN-WALL INSULATION

A. Install board insulation in curtain-wall construction where indicated on Drawings according to curtain-wall manufacturer's written instructions.
   1. Hold insulation in place by securing metal clips and straps or integral pockets within window frames, spaced at intervals recommended in writing by insulation manufacturer to hold
insulation securely in place without touching spandrel glass. Maintain cavity width of
dimension indicated between insulation and glass.
2. Install insulation where it contacts perimeter fire-containment system to prevent insulation
from bowing under pressure from perimeter fire-containment system.

3.9 PROTECTION

A. Protect installed insulation and vapor retarders from damage due to harmful weather exposures,
physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is
subject to abuse and cannot be concealed and protected by permanent construction immediately
after installation.

3.10 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials
while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in
designated areas for reuse or recycling. If recycling options are available locally or through
manufacturer, recycle as a minimum, the following materials:
1. Aluminum
2. Plastic Materials and Gaskets
3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 21 00
SECTION 07 27 26 - FLUID-APPLIED MEMBRANE AIR BARRIERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes fluid-applied, vapor-retarding membrane air barriers.

B. Related Requirements:
   1. Division 06 Section "Sheathing" for wall sheathings and wall sheathing joint-and-penetration treatments.
   2. Division 07 Section “Sheet Metal Flashing and Trim” for metal flashings associated with the membrane air barrier.

1.3 DEFINITIONS

A. Air-Barrier Material: A primary element that provides a continuous barrier to the movement of air.

B. Air-Barrier Accessory: A transitional component of the air barrier that provides continuity.

C. Air-Barrier Assembly: The collection of air-barrier materials and accessory materials applied to an opaque wall, including joints and junctions to abutting construction, to control air movement through the wall.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.
   1. Review air-barrier requirements and installation, special details, mockups, air-leakage and bond testing, air-barrier protection, and work scheduling that covers air barriers.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include manufacturer’s written instructions for evaluating, preparing, and treating substrate; technical data; and tested physical and performance properties of products.

B. LEED Submittals:
   1. Product Data for Credit IEQ 4.2: For air-barrier products, documentation including printed statement of VOC content.

C. Shop Drawings: For air-barrier assemblies.
   1. Show locations and extent of air barrier. Include details for substrate joints and cracks, counterflashing strips, penetrations, inside and outside corners, terminations, and tie-ins with adjoining construction.
   2. Include details of interfaces with other materials that form part of air barrier.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.
B. Product Certificates: From air-barrier manufacturer, certifying compatibility of air barriers and accessory materials with Project materials that connect to or that come in contact with the barrier.

C. Product Test Reports: For each air-barrier assembly, for tests performed by a qualified testing agency.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
   1. Installer shall be licensed by ABAA according to ABAA’s Quality Assurance Program and shall employ ABAA-certified installers and supervisors on Project.

B. Mockups: Build mockups to set quality standards for materials and execution and for preconstruction testing.
   1. Build integrated mockups of exterior wall assembly as shown on Drawings, incorporating backup wall construction, external cladding, window, storefront, door frame and sill, insulation, ties and other penetrations, and flashing to demonstrate surface preparation, crack and joint treatment, application of air barriers, and sealing of gaps, terminations, and penetrations of air-barrier assembly.
      a. Coordinate construction of mockups to permit inspection by Owner's testing agency of air barrier before external insulation and cladding are installed.
      b. Include junction with roofing membrane, building corner condition, and foundation wall intersection.
      c. If Architect determines mockups do not comply with requirements, reconstruct mockups and apply air barrier until mockups are approved.
   2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Remove and replace liquid materials that cannot be applied within their stated shelf life.

B. Protect stored materials from direct sunlight.

1.9 FIELD CONDITIONS

A. Environmental Limitations: Apply air barrier within the range of ambient and substrate temperatures recommended by air-barrier manufacturer.
   1. Protect substrates from environmental conditions that affect air-barrier performance.
   2. Do not apply air barrier to a damp or wet substrate or during snow, rain, fog, or mist.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Source Limitations: Obtain primary air-barrier materials and air-barrier accessories from single source from single manufacturer.

B. VOC Content: 75 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24) and complying with VOC content limits of authorities having jurisdiction.
2.2 PERFORMANCE REQUIREMENTS

A. General: Air barrier shall be capable of performing as a continuous vapor-retarding air barrier and as a liquid-water drainage plane flashed to discharge to the exterior incidental condensation or water penetration. Air-barrier assemblies shall be capable of accommodating substrate movement and of sealing substrate expansion and control joints, construction material changes, penetrations, tie-ins to installed waterproofing, and transitions at perimeter conditions without deterioration and air leakage exceeding specified limits.

B. Air-Barrier Assembly Air Leakage: Maximum 0.0008 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft. (0.004 L/s x sq. m of surface area at 75 Pa), when tested according to ASTM E 2357.

2.3 VAPOR-RETARDING MEMBRANE AIR BARRIER

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Synthetic Polymer Membrane:

2. Physical and Performance Properties:
   a. Air Permeance: Maximum 0.0002 cfm/sq. ft. of surface area at 1.57-lbf/sq. ft. (0.001 L/s x sq. m of surface area at 75-Pa)
   b. Vapor Permeance: Maximum 0.08 perm (4.6 ng/Pa x s x sq. m)
   c. Ultimate Elongation: Minimum 500 percent; ASTM D 412, Die C.

2.4 ACCESSORY MATERIALS

A. General: Accessory materials recommended by air-barrier manufacturer to produce a complete air-barrier assembly and compatible with primary air-barrier material.

B. Transition Membrane: Vapor retarding, 40 mils (1.0 mm) thick, smooth surfaced, self-adhering; consisting of 36 mils (0.9 mm) of rubberized asphalt laminated to a 4-mil- (0.1-mm-) thick polyethylene film with release liner backing.

C. Flexible Membrane Wall Flashing: Vapor retarding, 40 mils (1.0 mm) thick, smooth surfaced, self-adhering; consisting of 32 mils (0.8 mm) of rubberized asphalt laminated to a 2-mil- (0.2-mm-) thick polyethylene film with release liner backing.

D. Joint Reinforcing Strip: Air-barrier manufacturer's glass-fiber-mesh tape.

E. Substrate-Patching Membrane: Manufacturer's standard trowel-grade substrate filler.

F. Adhesive and Tape: Air-barrier manufacturer's standard adhesive and pressure-sensitive adhesive tape.

G. Sprayed Polyurethane Foam Sealant: One- or two-component, foamed-in-place, polyurethane foam sealant, 1.5- to 2.0-lb/cu. ft (24- to 32-kg/cu. m) density; flame-spread index of 25 or less according to ASTM E 162; with primer and noncorrosive substrate cleaner recommended by foam sealant manufacturer.

H. Joint Sealant: ASTM C 920, single-component, neutral-curing silicone; Class 100/50 (low modulus), Grade NS, Use NT related to exposure, and, as applicable to joint substrates indicated, Use O. Comply with Division 07 Section “Joint Sealants.”

I. Termination Mastic: Air-barrier manufacturer's standard cold fluid-applied elastomeric liquid; trowel grade.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
   1. Verify that substrates are sound and free of oil, grease, dirt, excess mortar, or other contaminants.
   2. Verify that concrete has cured and aged for minimum time period recommended by air-barrier manufacturer.
   3. Verify that concrete is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
   4. Verify that masonry joints are flush and completely filled with mortar.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

A. Clean, prepare, treat, and seal substrate according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate for air-barrier application.

B. Mask off adjoining surfaces not covered by air barrier to prevent spillage and overspray affecting other construction.

C. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

D. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids in concrete with substrate-patching membrane.

E. Remove excess mortar from masonry ties, shelf angles, and other obstructions.

F. At changes in substrate plane, apply sealant or termination mastic beads at sharp corners and edges to form a smooth transition from one plane to another.

G. Cover gaps in substrate plane and form a smooth transition from one substrate plane to another with stainless-steel sheet mechanically fastened to structural framing to provide continuous support for air barrier.

3.3 JOINT TREATMENT

A. Concrete and Masonry: Prepare, treat, rout, and fill joints and cracks in substrate according to ASTM C 1193 and air-barrier manufacturer's written instructions. Remove dust and dirt from joints and cracks complying with ASTM D 4258 before coating surfaces.

B. Gypsum Sheathing: Fill joints greater than 1/4 inch (6 mm) with sealant according to ASTM C 1193 and air-barrier manufacturer's written instructions. Apply first layer of fluid air-barrier material at joints. Tape joints with joint reinforcing strip after first layer is dry. Apply a second layer of fluid air-barrier material over joint reinforcing strip.

3.4 TRANSITION STRIP INSTALLATION

A. General: Install strips, transition strips, and accessory materials according to air-barrier manufacturer's written instructions to form a seal with adjacent construction and maintain a continuous air barrier.
1. Coordinate the installation of air barrier with installation of roofing membrane and base flashing to ensure continuity of air barrier with roofing membrane.

2. Install modified bituminous strip on roofing membrane or base flashing so that a minimum of 3 inches (75 mm) of coverage is achieved over each substrate.

B. Connect and seal exterior wall air-barrier material continuously to roofing-membrane air barrier, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings, using accessory materials.

C. At end of each working day, seal top edge of strips and transition strips to substrate with termination mastic.

D. Apply joint sealants forming part of air-barrier assembly within manufacturer's recommended application temperature ranges. Consult manufacturer when sealant cannot be applied within these temperature ranges.

E. Wall Openings: Prime concealed, perimeter frame surfaces of windows, curtain walls, storefronts, and doors. Apply modified bituminous transition strip so that a minimum of 3 inches (75 mm) of coverage is achieved over each substrate. Maintain 3 inches (75 mm) of full contact over firm bearing to perimeter frames with not less than 1 inch (25 mm) of full contact.

1. Modified Bituminous Transition Strip: Roll firmly to enhance adhesion.

F. Fill gaps in perimeter frame surfaces of windows, curtain walls, storefronts, and doors, and miscellaneous penetrations of air-barrier material with foam sealant.

G. Seal strips and transition strips around masonry reinforcing or ties and penetrations with termination mastic.

H. Seal top of through-wall flashings to air barrier with an additional 6-inch- (150-mm-) wide, modified bituminous strip.

I. Seal exposed edges of strips at seams, cuts, penetrations, and terminations not concealed by metal counterflashings or ending in reglets with termination mastic.

J. Repair punctures, voids, and deficient lapped seams in strips and transition strips. Slit and flatten fishmouths and blisters. Patch with transition strips extending 6 inches (150 mm) beyond repaired areas in strip direction.

3.5 FLUID AIR-BARRIER MEMBRANE INSTALLATION

A. General: Apply fluid air-barrier material to form a seal with strips and transition strips and to achieve a continuous air barrier according to air-barrier manufacturer's written instructions. Apply fluid air-barrier material within manufacturer's recommended application temperature ranges.

B. Membrane Air Barriers: Apply a continuous unbroken air-barrier membrane to substrates according to the following thickness. Apply air-barrier membrane in full contact around protrusions such as masonry ties.

1. Total dry film thickness as recommended in writing by manufacturer to meet performance requirements, but not less than 60-mil (1.5-mm) dry film thickness.

2. Spray using cross-hatching technique (alternating horizontal and vertical passes) to ensure even thickness and coverage.

3. When spraying use high pressure, multi-component, airless spray equipment approved by material manufacturer.

4. Carry membrane into any openings a minimum of 50 mm (2 in).

5. Seal all brick ties and other penetrations as work progresses.
C. Apply strip and transition strip over cured air-barrier material overlapping 3 inches (75 mm) onto each surface according to air-barrier manufacturer's written instructions.

D. Do not cover air barrier until it has been tested and inspected by Owner's testing agency.

E. Correct deficiencies in or remove air barrier that does not comply with requirements; repair substrates and reapply air-barrier components.

F. Do not allow the rubberized asphalt surface of the flashing membrane to come in contact with polysulfide sealants, creosote, uncured coal tar products or EPDM.

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Inspections: Air-barrier materials, accessories, and installation are subject to inspection for compliance with requirements. Inspections may include the following:
   1. Continuity of air-barrier system has been achieved throughout the building envelope with no gaps or holes.
   2. Continuous structural support of air-barrier system has been provided.
   3. Masonry and concrete surfaces are smooth, clean, and free of cavities, protrusions, and mortar droppings.
   4. Site conditions for application temperature and dryness of substrates have been maintained.
   5. Maximum exposure time of materials to UV deterioration has not been exceeded.
   6. Laps in strips and transition strips have complied with minimum requirements and have been shingled in the correct direction (or mastic has been applied on exposed edges), with no fishmouths.
   7. Termination mastic has been applied on cut edges.
   8. Strips and transition strips have been firmly adhered to substrate.
   9. Compatible materials have been used.
   10. Transitions at changes in direction and structural support at gaps have been provided.
   11. Connections between assemblies (air-barrier and sealants) have complied with requirements for cleanliness, surface preparation and priming, structural support, integrity, and continuity of seal.
   12. All penetrations have been sealed.

C. Tests: As determined by Owner's testing agency from among the following tests:
   1. Adhesion Testing: Air-barrier assemblies will be tested for minimum air-barrier adhesion of 30 lbf/sq. in. (207 kPa) according to ASTM D 4541 for each 600 sq. ft. (56 sq. m) of installed air barrier or part thereof.

D. Air barriers will be considered defective if they do not pass tests and inspections.
   1. Apply additional air-barrier material, according to manufacturer's written instructions, where inspection results indicate insufficient thickness.
   2. Remove and replace deficient air-barrier components for retesting as specified above.

E. Repair damage to air barriers caused by testing; follow manufacturer's written instructions.

3.7 CLEANING AND PROTECTION

A. Protect air-barrier system from damage during application and remainder of construction period, according to manufacturer's written instructions.
   1. Protect air barrier from exposure to UV light and harmful weather exposure as required by manufacturer. If exposed to these conditions for more than 60 days, remove and replace air barrier or install additional, full-thickness, air-barrier application after repairing and preparing the overexposed membrane according to air-barrier manufacturer's written instructions.
   2. Protect air barrier from contact with incompatible materials and sealants not approved by air-barrier manufacturer.
B. Clean spills, stains, and soiling from construction that would be exposed in the completed work using cleaning agents and procedures recommended by manufacturer of affected construction.

C. Remove masking materials after installation.

3.8 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 27 26
SECTION 07 31 26 - SLATE SHINGLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Slate shingles.
   2. Underlayment.
   3. Copper flashing and sheet metal work.
   4. Copper screen for eave venting.
   5. Ridge vent product.
   6. Snow guards.

B. Related Sections:
   1. Division 06 Section "Sheathing" for roof sheathing.
   2. Division 07 Section “Sheet Metal Flashing & Trim” for flashing and trim not specified here.
   3. Division 07 Section “Joint Sealants” for joint sealants used in conjunction with slate roofing.

1.3 DEFINITIONS

A. Roofing Terminology: See ASTM D 1079 and glossary in NRCA's "The NRCA Roofing and Waterproofing Manual" for definitions of terms related to roofing work in this Section.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples for Initial Selection: Of each color, size, texture, and shape.
   1. Include similar Samples of trim and accessories involving color selection.

C. Samples for Verification: For the following products, of sizes indicated, to verify color selected:
   1. Slate Shingle: 6 shingles illustrating the full range of colors in the blend.
   2. Underlayment.
   3. Ridge Vent: 12-inch Sample.
   5. Fasteners: Three fasteners of each type, length, and finish.

1.5 INFORMATIONAL SUBMITTALS

A. Material Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each slate variety.

B. Warranty: Sample of special warranty.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Slate Shingles: 100 sq. ft. of each type and color, in unbroken bundles.

1.7 QUALITY ASSURANCE

A. Source Limitations: Obtain each color of slate shingle from single quarry capable of producing slate of consistent quality in appearance and physical properties.

B. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
1. Build mockups for slate shingles including related roofing materials, including flashings and snow guards.
   a. Size: 48 inches long by 48 inches wide.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

C. Preinstallation Conference: Conduct conference at Project site.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store underlayment rolls on end, on pallets or other raised surfaces. Do not double stack rolls.
1. Handle, store, and place roofing materials in a manner to avoid significant or permanent damage to roof deck or structural supporting members.

B. Protect unused underlayment from weather, sunlight, and moisture when left overnight or when roofing work is not in progress.

1.9 PROJECT CONDITIONS

A. Environmental Limitations: Proceed with installation of self-adhering sheet underlayment only within the range of ambient and substrate temperatures recommended by manufacturer.

1.10 WARRANTY

A. Special Warranty: Standard form in which roofing Installer agrees to repair or replace slate roofing that fails in materials or workmanship within specified warranty period.
1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SLATE SHINGLES

A. Slate Shingles: ASTM C 406, Grade S1; hard, dense, and sound; chamfered edges, with nail holes machine punched or drilled and countersunk. No broken or cracked slates, no broken exposed corners, and no broken corners on covered ends that could sacrifice nailing strength or laying of a watertight roof.
2. Size: 18 inches long by 12 inches wide.
3. Nail Holes: Two per shingle, placed 1-1/4" to 1-1/2" from edge, and exposure + 4-1/2" from bottom.
5. Color: Black.

B. Starter Slate: Slate shingles with chamfered nail holes front-side punched.
1. Length: Exposure of slate shingle plus head lap.
2. Width: to match field slates.

C. Physical Requirements:
1. Slates with a strong grain must be produced “on the grain”, that is, the direction of the grain of the stone must be parallel to the long dimension of the shingle. Slates shall be randomly selected from each shipment and tested for grain direction to ensure proper fabrication.
2. Slates with broken corners on the exposed ends shall not be installed when either the base or leg of the right triangular piece broken off is greater than 1 ½ inches. Slates with broken corners are acceptable for cutting stock.
3. The curvature of shingles shall not exceed 1/8 inch in 12 inches. Curved slates shall be trimmed and holed to permit them to be laid with the convex side facing up.
4. “Knots” and “knurls” are rounded defects that affect the smoothness of split. They are acceptable on the exposed portion of the top face but on other parts will prevent close contact of shingles. Shingles having knots or knurls on the covered portions projecting in excess of 1/16 inch shall not be used if they prevent proper fit and contact.
5. Slates shall be free from ribbons.
6. Face dimensions shall not differ from those specified by more than 1/8 inch.

2.2 UNDERLAYMENT MATERIALS
A. Felt Underlayment: Water repellant, breather type cellulose/glass fiber composite roofing underlayment.
1. 30# “Leatherback” as manufactured by GAF Materials Corporation, or a comparable product.
1. Basis-of-Design Product: Subject to compliance with requirements, provide Grace Ice & Water Shield, as manufactured by Grace Construction Products, a division of W.R.Grace & Co., or comparable product.

2.3 SNOW GUARDS
A. Snow-Guard Pads: Fabricated cast-bronze units, designed to be installed without penetrating slate shingles, and complete with predrilled holes or hooks for anchoring.
1. Basis-of-Design Product: Subject to compliance with requirements, provide Model #200S-NA “Snow Spikes” as manufactured by Bronze Guard, a division of M. J. Mullane Company, Inc., Hudson, MA., or a comparable product.

2.4 ACCESSORIES
A. Asphalt Roofing Cement: ASTM D 4586, Type II, asbestos free.
B. Slating Nails: ASTM F 1667, stainless-steel, ribbed shanked, wire nails; 0.135-inch minimum thickness; sharp pointed; with 3/8-inch- minimum diameter flat head; of sufficient length to penetrate a minimum of 3/4 inch into sheathing without penetrating through sheathing.
C. Felt Underlayment Nails: Stainless-steel wire nails with low-profile capped heads or disc caps, 1-inch minimum diameter.

2.5 METAL FLASHING AND TRIM
A. General: Comply with requirements in Division 07 Section “Sheet Metal Flashing and Trim.”
2. Flashing thickness: Minimum 16 oz.
B. Fabricate sheet metal flashing and trim to comply with recommendations that apply to design, dimensions, metal, and other characteristics of the item in SMACNA's "Architectural Sheet Metal Manual" and Revere's "Copper and Common Sense."
   1. Apron Flashings: Fabricate with lower flange extending a minimum of 4 inches over and 4 inches beyond each side of downslope slate shingles and 6 inches up the vertical surface.
   2. Step Flashings: Fabricate with a head lap of 3 inches and a minimum extension of 4 inches both horizontally and vertically.
   3. Cricket Flashings: Fabricate with concealed flange extending a minimum of 18 inches beneath upslope slate shingles and 6 inches beyond each side of chimney or skylight and 6 inches above the roof plane.
   4. Hip Flashings: Fabricate to length of slate shingle and to extend 3 inches beyond joint of hip shingle with adjoining roof shingle.
   5. Open-Valley Flashings: Fabricate in lengths not exceeding 10 feet with 1-inch-high, inverted-V profile at center of valley and equal flange widths of 12 inches.
   6. Closed-Valley Flashings: Fabricate in lengths not exceeding 10 feet and equal flange widths of 12 inches.
   7. Drip Edges: Fabricate in lengths not exceeding 10 feet with 2-inch roof-deck flange and 1-1/2-inch fascia flange with 3/8-inch drip at lower edge.

C. Vent-Pipe Flashings: ASTM B 749, Type L51121, at least 1/16 inch thick. Provide lead sleeve sized to slip over and turn down into pipe, soldered to skirt at slope of roof and extending at least 4 inches from pipe onto roof.

   1. Model: Vented.
   2. Material: Vent to be slate covered and manufactured from 20 oz zinc/tin coated copper.
   3. Provide end caps manufactured from 20 oz zinc/tin coated copper.
   4. Provide ventilating mesh product as manufactured by Castle Metal Products along entire length of ridge vent.
   5. Provide ventilating base approved for use by Top Slate manufacturer; Ventilating base shall be continuous low profile and resistant to compression, providing a net free area of 18 sq in / lineal foot of ridge.
   6. Install per manufacturer's instructions.
   7. Slates installed over ridge vent to be twice as long as typical roofing slates.
   8. Color of ridge slates to match typical roofing slates.

E. Soffit Vent: Copper insect screen.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
   1. Examine roof sheathing to verify that sheathing joints are supported by framing and blocking or metal clips and that installation is within flatness tolerances.
   2. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and completely anchored and that provision has been made for flashings and penetrations through roofing.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 UNDERLAYMENT INSTALLATION

A. General: Comply with underlayment manufacturer's written installation instructions applicable to products and applications indicated unless more stringent requirements apply.
B. Single-Layer Felt Underlayment: Install on roof deck parallel with and starting at the eaves. Lap sides a minimum of 2 inches over underlying course. Lap ends a minimum of 4 inches. Stagger end laps between succeeding courses at least 72 inches. Fasten with felt underlayment nails.
   1. Install felt underlayment on roof deck not covered by self-adhering sheet underlayment. Lap sides of felt over self-adhering sheet underlayment not less than 3 inches in direction to shed water. Lap ends of felt not less than 6 inches over self-adhering sheet underlayment.

C. Self-Adhering Sheet Underlayment: Install, wrinkle free, on roof deck. Comply with low-temperature installation restrictions of underlayment manufacturer if applicable. Install at locations indicated below and on Drawings, lapped in direction to shed water. Lap sides not less than 3-1/2 inches. Lap ends not less than 6 inches, staggered 24 inches between courses. Roll laps with roller. Cover underlayment within seven days.
   1. Eaves: Extend from edges of eaves 36 inches beyond interior face of exterior wall.
   2. Rakes: Extend from edges of rakes 36 inches beyond interior face of exterior wall.
   3. Hips: Extend 18 inches on each side.
   4. Ridges: Extend 36 inches on each side without obstructing continuous ridge vent slot.
   5. Sidewalls: Extend 18 inches beyond sidewalls and return vertically against sidewalls not less than 4 inches.
   6. Dormers, Chimneys, Skylights, and Other Roof-Penetrating Elements: Extend 18 inches beyond penetrating elements and return vertically against penetrating elements not less than 4 inches.
   7. Roof-Slope Transitions: Extend 18 inches on each roof slope.

3.3 METAL FLASHING INSTALLATION

A. General: Install metal flashings and other sheet metal to comply with requirements in Division 07 Section "Sheet Metal Flashing and Trim."
   1. Install metal flashings according to recommendations in NRCA's "The NRCA Roofing and Waterproofing Manual."

B. Apron Flashings: Extend lower flange over and beyond each side of downslope slate shingles and up the vertical surface.

C. Step Flashings: Install with a head lap of 3 inches and extend both horizontally and vertically. Install with lower edge of flashing just upslope of, and concealed by, butt of overlying slate shingle. Fasten to roof deck only.

D. Cricket Flashings: Install against the roof-penetrating element, extending concealed flange beneath upslope slate shingles and beyond each side.

E. Hip Flashings: Install centrally over hip with lower edge of flashing concealed by butt of overlying slate shingle. Fasten to roof deck.

F. Rake Drip Edges: Install over underlayment and fasten to roof deck.

G. Eave Drip Edges: Install beneath underlayment and fasten to roof deck.

H. Pipe Flashings: Form flashing around pipe penetrations and slate shingles. Fasten and seal to slate shingles.

3.4 SLATE-SHINGLE INSTALLATION

A. General: Beginning at eaves, install slate shingles according to manufacturer's written instructions and to details and recommendations in NRCA's "The NRCA Roofing and Waterproofing Manual."
   1. Install preformed copper drip edge with built-in inverted 'V' groove cant at eave edges.
   2. Install shingle starter course chamfered face down.
B. Install first and succeeding shingle courses with chamfered face up. Install full-width first course at rake edge.
   1. Offset joints of uniform-width slate shingles by half the shingle width in succeeding courses.

C. Maintain a 3-inch- minimum head lap between succeeding shingle courses.

D. Each course shall break joints laterally by a minimum of 3”, if possible, with the underlying or overlying course.

E. Maintain uniform 7 ½ inch exposure of shingle courses.

F. Extend shingle starter course and first course over fasciae at eaves as indicated on Drawings.

G. Cut and fit slate neatly around roof vents, pipes, ventilators, and other projections through roof.

H. Hang slate with two slating nails for each shingle with nail heads lightly touching slate. Do not drive nails home drawing slates downward or leave nail head protruding enough to interfere with overlapping shingle above.
   1. For vented ridge, terminate slate shingles leaving uniform air space on each side of ridge apex.
   2. Install vented ridge cap as shown in Drawings.

I. Hips: Install and anchor slate hips in mitered configuration.
   1. Form hips by butting the cut and fitted roof slates at the hip, maintaining regular coursing. If required, vary the width of the slates in the course so that there are no small triangles of slate at the hip, without the capability of concealing nailing.

3.5 SNOW-GUARD INSTALLATION

A. Snow-Guard Pads: Install snow-guards in pattern indicated on Drawings.

B. Build into field of roofing slates as the roofing installation progresses, nailing into roof deck.

C. Remove and replace damaged or broken slate shingles.

D. Remove excess slate and debris from Project site.

3.6 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 31 26
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Horizontal hot fluid applied rubberized asphalt membrane.
2. Roofing components.
3. Rigid insulation.
4. Washed smooth river stone.

B. Related Sections include the following:

1. Division 6 Section “Rough Carpentry” for blocking and curbing.
2. Division 7 Section “Sheet Metal Flashing and Trim” for metal roof penetration flashings, flashings, and counterflashings.
3. Division 7 Section “Sheathing” for gypsum fiber sheathing under garden roof systems.
4. Division 7 Section “Joint Sealants”.
5. Division 15 Section “Plumbing Specialties” for roof drains.
6. Division 32 Section “Roof Garden Landscaping.”

1.3 DEFINITIONS

A. Green Roof: An area of planting/landscaping, built up on a waterproofed substrate at any level that is separated from the natural ground by a man-made structure.

B. Extensive Green Roof: Low to no maintenance landscaping consisting of shallow soil depths (6 inches or less) with plant varieties restricted to primarily mosses, herbs and succulents capable of withstandning harsh growing conditions.

1.4 REFERENCES

A. American Society for Testing and materials (ASTM):

1. ASTM D 36: Test Method for Softening Point of Bitumen (Ring-and-Ball Apparatus.)
2. ASTM D 92: Test Method for Flash and Fire Points by Cleveland Open Cup.

1.5 PERFORMANCE REQUIREMENTS

A. General: Provide installed roofing membrane and base flashings that remain watertight; do not permit the passage of water, thermally induced movement, and exposure to weather without failure.

B. Material Compatibility: Provide roofing materials that are compatible with one another under conditions of service and application required, as demonstrated by roofing membrane manufacturer based on testing and field experience.

1.6 SYSTEM DESCRIPTION

A. Garden Roof System to be installed over:
   1. Concrete substrate.
   2. Metal deck with glass mat sheathing.

B. Garden Roof System to consist of:
   1. Fluid-applied hot rubberized membrane waterproofing.
   2. Flashings.
   3. Rigid insulation.
   5. Roof garden soil mix and landscaping as specified in Section 32 95 00 Roof Garden Landscaping.

1.7 SUBMITTALS

A. Product Data: For each type of product indicated. Include descriptive published data indicating characteristics and limitations. Include standard details and system components.

B. Shop Drawings: Plan layout, vertical sections through system, and details at critical terminations of garden roof system with adjacent construction. Include additional details not covered by manufacturer’s instructions and Product Data.

C. Samples for Verification:
   1. Garden roof system components, including water retention/drainage panel and other components for retaining and managing water system.
   2. Washed smooth river stone: Submit range of available colors for selection by Architect.
   3. Growing Media: 1-pint (0.5-liter) volume of each growing medium, in sealed plastic bags labeled with content and source. Each Sample shall be typical of the lots of growing media to be furnished. Provide an accurate representation of texture and composition.
   4. Moisture-Retention Mat: 12 by 12 inches (300 by 300 mm).
   5. Molded-Sheet Drainage Panels: 12 by 12 inches (300 by 300 mm).
   6. Protection Fabric: 12 by 12 inches (300 by 300 mm).
   7. Drainage Gravel: 1-pint (0.5-liter) Insert quantity volume in sealed plastic bags labeled with content and source.
   8. Root Barrier: 12 by 12 inches (300 by 300 mm).
   9. Separation Geotextile: 12 by 12 inches (300 by 300 mm).
   10. Access Boxes: One in each size and color required.
   11. Soil Retainer: Manufacturer’s standard size to verify configuration and color selected.
D. Certification from an approved independent testing laboratory experienced in testing rubberized asphalt material, that the material meets the CGSB-37.50-M89 standard for rubberized asphalt membranes, including applicable ASTM procedures.

E. Certification showing full time quality control of production facilities responsible for the manufacture of the rubberized asphalt and that each batch of material is tested to insure conformance with the manufacturer's published physical properties.

F. Certification showing that all components of the green roof assembly are being supplied and warranted by a single-source manufacturer.

G. Evidence that the roof membrane assembly is currently Class A listed with Underwriters Laboratories.

H. Evidence that the extruded polystyrene insulation if used is free from CFC's.

I. Evidence that the rubberized asphalt membrane product contains an inert clay filler and crumb rubber to enable the product to be resistant to acids (fertilizers, building washes and acid rain) and maintain membrane thickness during application.

J. The plant manufacturing the rubberized asphalt material must have ISO9002 approval as evidenced by a notarized copy of the official certificate.

K. Installer Certificates: Signed by roofing system manufacturer certifying that Installer is approved, authorized, or licensed by manufacturer to install roofing system.

L. Manufacturer Certificates: Signed by roofing manufacturer certifying that roofing system complies with requirements specified in "Performance Requirements" Article.

1. Submit evidence of meeting performance requirements.

M. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for components of roofing system.

N. Research/Evaluation Reports: For components of membrane roofing system.

O. Maintenance Data: For roofing system to include in maintenance manuals.

P. Sample Warranty: Submit manufacturer's warranty showing compliance with provisions of this Section.

Q. Inspection Report: Copy of roofing system manufacturer's inspection report of completed roofing installation.

R. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

1.8 QUALITY ASSURANCE

A. Single Source Responsibility: Perform waterproofing system as specified in this system, and also garden roof plantings and soil and specified in Section 32, as single system under responsibility of waterproofing manufacturer.
B. The Roofing/Waterproofing Contractor shall demonstrate qualifications to perform the work of this Section by submitting the following documentation:

1. Certification or license by the membrane manufacturer as a locally based, authorized applicator of the product the installer intends to use, for a minimum of five (5) years.
2. List of at least three (3) projects, satisfactorily completed within the past five (5) years, of similar scope and complexity to this project. Previous experience submittal shall correspond to specific membrane system proposed for use by applicator.

C. Membrane Manufacturer Qualifications: Manufacturer shall demonstrate qualifications to supply materials of this section by certifying the following:

1. Membrane Manufacturer must show evidence that the specified rubberized asphalt has been manufactured by the same source for fifteen (15) years and successfully installed on a yearly basis for a minimum of fifteen (15) years on projects of similar scope and complexity.
2. Membrane Manufacturer must not issue warranties for terms longer than they have been manufacturing their hot fluid rubberized asphalt membrane.
3. Maintain locally available representation for technical and inspection support services.
4. Maintain locally available landscape installer on retainage to install soil and planting and maintain planting for one year following work of this Section.

D. Manufacturer's Technical Representative: Available on site to make interim observations, recommendations, and final inspection. Available to verify installation in conformance with manufacturer's Warranty provisions.

E. Preinstallation Conference: Conduct conference at Project site approximately 2 weeks prior to beginning work of this section. Conference shall be attended by GC/CM, waterproofing applicator, planting installer, Owner, Architect, manufacturer's representative, and as requested to attend.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original unopened containers of packaging clearly labeled with manufacturer's name, brand name, instruction for use, all identifying numbers, and U.L. labels.

B. Materials shall be stored in a neat, safe manner, not to exceed the allowable structural capacity of the storage area.

C. Store materials in a clean, dry area protected from water and direct sunlight.

D. Store all adhesives at temperatures between 60°F (15.5°C) and 80°F (26.6°C). If exposed to lower temperatures, restore materials to 60°F (15.5°C) minimum temperature before using.

1.10 PROJECT CONDITIONS

A. Application of the membrane shall not commence nor proceed during inclement weather. All surfaces to receive the membrane shall be free of water, dew, frost, snow and ice.

B. Application of membrane shall not commence nor proceed when the ambient temperature is below 0°F (-17.7°C).

C. Preparation and application of membrane must be conducted in well ventilated areas.

D. Over its service life, do not expose membrane or accessories to a constant temperature in excess of 180°F (82°C) (i.e., hot pipes and vents or direct steam venting, etc.).
E. Adhesives contain petroleum distillates and are extremely flammable. Do not breathe vapors or use near an open fire. Do not use in confined areas without adequate ventilation. Consult container or packaging labels and Material Safety Data Sheets (MSDS) for specific safety information.

F. Do not allow waste products (petroleum, grease, oil, solvents, vegetable or mineral oil, animal fat, etc.) to come in contact with the roof membrane. Any exposure to foreign materials or chemical discharges must be presented to membrane manufacturer for evaluation to determine any impact on the roof membrane assembly performance.

G. Concrete Slab: Minimum 14 day curing time, minimum 28 day curing time preferred. Wood troweled finish preferred.

H. Temperature Exposure: Protect fluid applied membrane waterproofing from prolonged temperature conditions exceeding 180°F, such as from hot pipes and vents.

I. Fluid Applied Membrane Waterproofing Weather Exposure: Maximum 30 days before covering is required.

J. General contractor shall assure that adequate protection is provided after installation so other trades do not damage membrane.

1.11 WARRANTY

A. Upon completion of the work, the contractor must supply the owner with a single-source warranty of U.S. origin direct from the manufacturer.

B. Total System Warranty: Covers components of the green roof assembly, including membrane, flashing, insulation, root barrier, drainage/water retention mat, and filter fabric, soil and plants. Includes removal and replacement of all components including soil when supplied by and installed by manufacturer’s requirements.

1. Duration of Membrane/Flashing: 20-year (watertight condition)
2. Duration of Insulation: 20-year (80% of original thermal value; remain on the deck withstanding wind speeds not to exceed 70 mph)

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

   a. American Hydrotech, Inc.
   b. Carlisle Coatings and Waterproofing: This or other alternate manufacturers may be considered. Architect to receive all technical literature on suggested products, as well as a line by line comparison to the physical properties listed below. All such material to be submitted to Architect 10 days before bid due date.
2.2 MEMBRANE

A. Membrane shall be a hot, fluid applied, rubberized asphalt membrane meeting the CGSB-37.50-M89 standard and other pertinent physical properties:

### 2.3 REINFORCING

**A.** Spunbonded polyester fabric (standard duty) reinforcing sheet.

1. **Basis-of-Design:** American Hydrotech, Inc., Flex Flash F®

**B.** 60-mil (1.5 mm) thick, uncured neoprene (heavy duty) reinforcing sheet

1. **Basis-of-Design:** American Hydrotech, Inc., Flex Flash UN®

### 2.4 FLASHING

**A.** 60-mil (1.5 mm) thick, uncured neoprene sheet.

1. **Basis-of-Design:** American Hydrotech, Inc., Flex Flash UN®

### 2.5 ADHESIVES/SEALANT

**A.** Contact adhesive to bond elastomeric flashing together.

1. **Basis-of-Design:** American Hydrotech, Inc., Splicing Cement
B. Contact adhesive to bond elastomeric flashing to an approved substrate.

C. Sealant to seal elastomeric flashing seam edge.

2.6 SEPARATION / ROOT BARRIER PROTECTION COURSE

A. For extensive or semi-intensive conditions; combination of a fiberglass reinforced rubberized asphalt sheet and polyethylene root barrier.

2.7 INSULATION

A. Extruded polystyrene rigid board insulation.
   1. Basis-of-Design: STYROFOAM® Brand insulation Plazamate as manufactured by The Dow Chemical Company, marketed by American Hydrotech, Inc.
      a. Insulation shall meet ASTM C-578, Type VII.
      b. Minimum compressive strength, ASTM D-1621, 60 psi c. Maximum water absorption by volume per ASTM C-272, 0.1%
      c. Water vapor permeance for 1" product per ASTM E-96, 1.0 perm (max.) (63 ng/Pa/s/m²)
      d. Insulation shall have an R value of 5.0°F ft² h/ft²/Btu/in. (0.88 K m²/W) of thickness when tested at 75°F (23.9°C) mean temperature in accordance with ASTM C-518
      e. Product shall be free of CFC's

2.8 DRAINAGE / WATER RETENTION COMPONENT

A. Three-dimensional, molded panels of recycled material with drainage channels top and bottom sides and water retention reservoirs top side.

2.9 FILTER FABRIC

A. Non-woven, polymeric, goetextile fabric.

2.10 INSPECTION CHAMBERS

A. Provide manufacturer's premium inspection chambers at all roof drain locations to allow for maintenance access.

B. Provide 18 gauge stainless steel, over-drain inspection box with perforated sides and removable lid.
   1. Size: 11 inch x 11 inch w/4" flanges, or 18 inch x 18 inch w/4" flanges, as required.
   2. Height: 4-3/4 inch.
3. Extensions: 1 inch, 3 inch or 8-1/2" extension as required by depth of assembly.

2.11 STAINLESS STEEL LANDSCAPE EDGE

A. Provide “Metal Edge Restraint” by American Hydrotech, or equal.
   1. 0.1" thick stainless steel angle landscape edge with slotted vertical leg
   2. Equal vertical and horizontal legs – see Drawings for dimensions.
   3. 8’ long sections
   4. 0.375” effective slot mean diameter; 0.11 sq in total opening; 12 slots per lin ft
   5. Provide corner sections, splices, clips and connection bolts to construct a complete installation.

2.12 WASHED SMOOTH RIVER STONE

A. For perimeter drainage material, and other areas as shown on Drawings:
   1. Size ASTM D 448, size 2, ranging in size from 1 ½” to 2 ½”.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify conditions ready to receive work of this Section. Do no work until unsatisfactory conditions are corrected. Beginning work constitutes acceptance of existing conditions.

B. Through-Slab Penetrations: Rigidly installed, prepared, and sealed in accordance with waterproofing membrane manufacturer's instructions.

3.2 PREPARATION

A. Prepare substrate surfaces, including joints and seams, in accordance with manufacturer's written instructions.

B. Sweep with broom and then use air compressor to blow remaining dust and debris from substrate.

C. Verify adhesion by applying test patch of fluid applied membrane waterproofing to substrate with manufacturer’s representative present.

3.3 WATERPROOFING INSTALLATION

A. Comply with manufacturer's instructions and provisions of Contract Documents. Where in conflict, assume more stringent requirements and verify with Architect before beginning.

B. Detailing and Flashing: Comply with manufacturer’s standard instructions and details.

1. Complete work prior to beginning fluid applied membrane waterproofing application.
2. Utilize manufacturer’s prefabricated components at penetrations, as applicable.

C. Fluid Applied Horizontal Membrane Waterproofing:
1. The membrane shall be heated in double jacketed, oil bath or hot air melter with mechanical agitation, specifically designed for the preparation of a rubberized asphalt membrane.

2. Heat membrane until membrane can be drawn-free flowing at a temperature range between 350°F (176°C) and 375°F (190°C).

3. Apply monolithic coat at continuous rate, 90 mils thick (approximately 3/16", but in no case less than 1/8") minimum.

5. Follow with 125 mils thick monolithic coat for total 215 mils thick membrane system.

D. JOINTS, CRACKS, AND TERMINATIONS

1. Prepare and treat substrates to receive roofing membrane, including joints and cracks, roof drains, and penetrations, according roofing system manufacturer's written instructions.

   a. Adhere strip of elastomeric sheet to substrate in a layer of hot fluid-applied, rubberized asphalt. Extend elastomeric sheet a minimum of 6 inches (150 mm) on each side of moving joints and cracks or joints and cracks exceeding 1/8 inch (3 mm) thick, and beyond roof drains and penetrations. Apply second layer of hot fluid-applied, rubberized asphalt over elastomeric sheet.

   b. Embed strip of reinforcing fabric into a layer of hot fluid-applied, rubberized asphalt. Extend reinforcing fabric a minimum of 6 inches (150 mm) on each side of nonmoving joints and cracks not exceeding 1/8 inch (3 mm) thick, and beyond roof drains and penetrations.

      1) Apply second layer of hot fluid-applied, rubberized asphalt over reinforcing fabric.

E. Separation/Root Barrier Protection Course Installation:

1. Protection Course: Installation of a separation course is necessary in order to carry out the water test.

2. Extensive Conditions

   a. Embed the Hydroflex® 30 separation sheet/root barrier protection course into the membrane while it is still hot to insure a good bond.

   b. Overlap adjoining sheet edges (dry) a minimum of 2"-3" (50.8 mm - 76.2 mm) to insure complete coverage.

   c. Torch.

F. Water Test:

1. All horizontal roof surfaces waterproofed with fluid applied membrane shall be leak tested by means of electronic testing or by ponding water at a minimum depth of 2" (50.8 mm) for a period of 48 hours to check the integrity of the membrane installation. [C]

2. All vertical surfaces associated with the roof that have been waterproofed with fluid applied membrane shall be leak tested by means of electronic testing, since flood testing in these areas is not feasible. [C]

3. VERIFY that the structure can support the deadload weight of a watertest before testing.

4. If leaks should occur the water must be drained completely and the membrane installation repaired.

G. Root Barrier:

1. A layer of Root Stop WSF 40® shall be laid over the Hydroflex® 30, lapping adjacent sheets 5 feet (1.5 m). The WSF 40 shall be turned up all vertical, roofed/flashed surfaces to completely protect waterproofing and flashings.
3.4 RIGID INSULATION INSTALLATION

A. Loose lay over root barrier in thickness to achieve R-Value as shown on Drawings. Where not shown, assume 6 inch thick for R-30.

B. Butt joints to prevent thermal wicking. Form tightly around penetrations and edges adjoining other construction. Fill voids over 1/8 inch wide with insulation material.

3.5 AIR LAYER

A. An air layer is required between the surface of the insulation and the water retention mat. A layer of Hydrodrain® AL or 300 shall be installed over the insulation. The 4 inch (100 mm) salvage edge of the geotextile fabric overlaps adjoining sheets and can be held in place with duct tape.

3.6 DRAINAGE AND WATER RETENTION COMPONENTS INSTALLATION

A. Water Retention Mat. Where specified, a layer of Moisture Mat SSM 45® shall be installed over the root barrier (when no insulation is specified) or air layer/insulation, lapping adjacent rolls a minimum of 4 inches (100 mm). The SSM 45 shall be turned up all vertical, roofed/flashed surfaces a minimum of 6 inches (150 mm) beyond the anticipated soil level. Any excess shall be trimmed down to the level of the soil.

B. Drainage/Water Retention: Floradrain® FD 25 shall be installed with holes through the dimples on top, over the root barrier protection, water retention mat (if used) or STYROFOAM® insulation (if used). Adjacent panels may be butt together or overlapped approximately 1 inch (25 mm) and fixed together with staples/clips. Gardendrain/Floradrain® shall be cut to fit around penetrations, etc. with a heavy-duty utility knife or small toothed saw.

C. Filter Fabric: A layer of Systemfilter SF® shall be laid over the Gardendrain/Floradrain, lapping adjacent rolls a minimum of 6 inches (150 mm). Enough material shall be left to be drawn up above the anticipated soil level. Any excess shall be trimmed down to the level of the soil.

3.7 SOIL AND PLANTING

A. Install soil mix over filter fabric to thickness shown on drawings and as specified by Landscape Architect.

B. Install washed rounded river rock around perimeters as shown on Drawings.

C. Plant and maintain ground cover as specified Section 32 95 00 Roof Garden Landscaping.

3.8 FIELD QUALITY CONTROL

A. Manufacturer’s Field Services:

1. Perform inspections during interim and at completion of fluid applied membrane waterproofing application.

2. Reinspect fluid applied membrane waterproofing application just prior to covering with garden roof components and soil.

3. Make necessary repairs and promptly make oral and written report to Contractor and Architect.
3.9 ADJUSTING, PROTECTING AND CLEANING

A. Repair fluid applied membrane waterproofing with additional coatings of new fluid applied waterproofing and as instructed by manufacturer to achieve waterproof installation.

B. Leave installations clean, premises free from debris and residue resulting from work of this Section.

C. Remove stains from adjacent surfaces with manufacturer's recommended cleaning agents.

D. Protect membrane waterproof from contamination from petroleum products, grease, oil, solvents, vegetable and mineral oils, animal fat, chemicals, and other foreign material.

3.10 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:

1. Aluminum
2. Plastic Materials and Gaskets
3. Corrugated cardboard packaging.

Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 33 00
SECTION 07 53 23 – EPDM MEMBRANE ROOFING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Adhered EPDM membrane roofing system.
   2. Peel and stick air/vapor retarder.
   3. Roof insulation.
   4. Roof sheathing.

B. Related Sections:
   1. Division 06 Section "Rough Carpentry" for wood nailers, curbs, and blocking.
   2. Division 07 Section "Sheet Metal Flashing and Trim" for metal roof penetration flashings, flashings, and counterflashings.
   3. Division 07 Section "Joint Sealants" for joint sealants, joint fillers, and joint preparation.

1.3 DEFINITIONS

A. Roofing Terminology: See ASTM D 1079 and glossary of NRCA’s "The NRCA Roofing and Waterproofing Manual" for definitions of terms related to roofing work in this Section.

1.4 PERFORMANCE REQUIREMENTS

A. General Performance: Installed membrane roofing and base flashings shall withstand specified uplift pressures, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Membrane roofing and base flashings shall remain watertight.

B. Material Compatibility: Provide roofing materials that are compatible with one another under conditions of service and application required, as demonstrated by membrane roofing manufacturer based on testing and field experience.

C. FM Approvals Listing: Provide membrane roofing, base flashings, and component materials that comply with requirements in FM Approvals 4450 and FM Approvals 4470 as part of a membrane roofing system, and that are listed in FM Approvals’ "RoofNav" for Class 1 or noncombustible construction, as applicable. Identify materials with FM Approvals’ markings.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. LEED Submittals:
   1. Product Data for Credit IEQ 4.1: For adhesives and sealants used inside the weatherproofing system, documentation including printed statement of VOC content.

C. Shop Drawings: For roofing system. Include plans, elevations, sections, details, and attachments to other work.
1. Base flashings and membrane terminations.
2. Tapered insulation, including slopes.

D. Samples for Verification: For the following products, in manufacturer's standard sizes:
   1. Sheet roofing, of color specified, including T-shaped side and end lap seam.
   2. Air/Vapor barrier.
   3. Roof insulation.
   4. Termination bars.
   5. Roof sheathing.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer and manufacturer.

B. Manufacturer Certificate: Signed by roofing manufacturer certifying that membrane roofing system complies with requirements specified in "Performance Requirements" Article.
   1. Submit evidence of complying with performance requirements.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for components of membrane roofing system.

D. Research/Evaluation Reports: For components of membrane roofing system.

E. Field quality-control reports.

F. Warranties: Sample of special warranties.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For membrane roofing system to include in maintenance manuals.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer that is FM Approvals approved for membrane roofing system identical to that used for this Project.

B. Installer Qualifications: A qualified firm that is approved, authorized, or licensed by membrane roofing system manufacturer to install manufacturer's product and that is eligible to receive manufacturer's special warranty.

C. Source Limitations: Obtain components including roof insulation, concrete deck primer, adhesives, air/vapor barrier and other components for membrane roofing system approved by membrane roofing manufacturer.

D. Exterior Fire-Test Exposure: ASTM E 108, Class A; for application and roof slopes indicated, as determined by testing identical membrane roofing materials by a qualified testing agency. Materials shall be identified with appropriate markings of applicable testing agency.

E. Preinstallation Roofing Conference: Conduct conference at Project site.
   1. Meet with Owner, Architect, Owner's insurer if applicable, testing and inspecting agency representative, roofing Installer, roofing system manufacturer's representative, deck Installer, and installers whose work interfaces with or affects roofing, including installers of roof accessories and roof-mounted equipment.
   2. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
   3. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
4. Examine deck substrate conditions and finishes for compliance with requirements, including flatness and fastening.
5. Review structural loading limitations of roof deck during and after roofing.
6. Review base flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect roofing system.
7. Review governing regulations and requirements for insurance and certificates if applicable.
8. Review temporary protection requirements for roofing system during and after installation.
9. Review roof observation and repair procedures after roofing installation.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver roofing materials to Project site in original containers with seals unbroken and labeled with manufacturer's name, product brand name and type, date of manufacture, approval or listing agency markings, and directions for storing and mixing with other components.

B. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by roofing system manufacturer. Protect stored liquid material from direct sunlight.
   1. Discard and legally dispose of liquid material that cannot be applied within its stated shelf life.

C. Protect roof insulation materials from physical damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location. Comply with insulation manufacturer's written instructions for handling, storing, and protecting during installation.

D. Handle and store roofing materials and place equipment in a manner to avoid permanent deflection of deck.

1.10 PROJECT CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit roofing system to be installed according to manufacturer's written instructions and warranty requirements.

1.11 WARRANTY

A. Special Warranty: Manufacturer's standard or customized form, without monetary limitation, in which manufacturer agrees to repair or replace components of membrane roofing system that fail in materials or workmanship within specified warranty period.
   1. Special warranty includes membrane roofing, base flashings, roof insulation, fasteners, cover boards, substrate board, vapor retarder, roofing accessories, walkway products, and other components of membrane roofing system.
   2. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 EPDM MEMBRANE ROOFING

A. EPDM: ASTM D 4637, Type II, scrim or fabric internally reinforced, uniform, flexible EPDM sheet.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Carlisle SynTec Incorporated.
      b. ERSystems.
      c. Firestone Building Products.
      d. GAF Materials Corporation.
      e. GenFlex Roofing Systems.
f. Johns Manville.
g. Roofing Products International, Inc.
h. Versico Incorporated.

2. Thickness: 90 mils, nominal.
3. Exposed Face Color: Black.

2.2 AUXILIARY MEMBRANE ROOFING MATERIALS

A. General: Auxiliary membrane roofing materials recommended by roofing system manufacturer for intended use and compatible with membrane roofing.
   1. Liquid-type auxiliary materials shall comply with VOC limits of authorities having jurisdiction.
   2. Adhesives and sealants that are not on the exterior side of weather barrier shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
      a. Plastic Foam Adhesives: 50 g/L.
      b. Gypsum Board and Panel Adhesives: 50 g/L.
      c. Multipurpose Construction Adhesives: 70 g/L.
      d. Fiberglass Adhesives: 80 g/L.
      e. Single-Ply Roof Membrane Adhesives: 250 g/L.
      f. Single-Ply Roof Membrane Sealants: 450 g/L.
      g. Nonmembrane Roof Sealants: 300 g/L.
      h. Sealant Primers for Nonporous Substrates: 250 g/L.
      i. Sealant Primers for Porous Substrates: 775 g/L.
      j. Other Adhesives and Sealants: 250 g/L.

B. Sheet Flashing: 90-mil-thick EPDM, partially cured or cured, according to application.

C. Protection Sheet: Epichlorohydrin or neoprene non-reinforced flexible sheet, 55- to 60-mil-thick, recommended by EPDM manufacturer for resistance to hydrocarbons, non-aromatic solvents, grease, and oil.

D. Bonding Adhesive: Manufacturer's standard.

E. Primer for Concrete Deck: Carlisle’s CCW-702 or CAV-GRIP, or equal product to be compatible with another manufacturer's roofing system.

F. Seaming Material: Single-component, butyl splicing adhesive and splice cleaner, or manufacturer's standard, synthetic-rubber polymer primer and 3-inch-wide minimum, butyl splice tape with release film.

G. Lap Sealant: Manufacturer's standard, single-component sealant, colored to match membrane roofing.

H. Water Cutoff Mastic: Manufacturer's standard butyl mastic sealant.

I. Metal Termination Bars: Manufacturer's standard, predrilled stainless-steel or aluminum bars, approximately 1 by 1/8 inch thick; with anchors.

J. Metal Battens: Manufacturer's standard, aluminum-zinc-alloy-coated or zinc-coated steel sheet, approximately 1 inch wide by 0.05 inch thick, prepunched.

K. Miscellaneous Accessories: Provide pourable sealers, preformed cone and vent sheet flashings, preformed inside and outside corner sheet flashings, reinforced EPDM securement strips, T-joint covers, in-seam sealants, termination reglets, cover strips, and other accessories.
2.3 **AIR / VAPOR BARRIER**

A. Manufacturer’s recommended Air & Vapor Barrier product that is compatible with EPDM membrane.
   1. Use Carlisle’s 725TR, or equal product by membrane manufacturer.
   2. 35 mil self-adhering rubberized asphalt laminated to 5 mil polyolefin film.

2.4 **ROOF INSULATION**

A. General: Preformed roof insulation boards manufactured or approved by EPDM membrane roofing manufacturer, selected from manufacturer’s standard sizes suitable for application, of thicknesses indicated and that produce FM Approvals-approved roof insulation.

B. Polysocyanurate Board Insulation: ASTM C 1289, Type II, Class I, Grade 3, felt or glass-fiber mat facer on both major surfaces.
   1. Polysocyanurate Board Insulation shall be CFC- and HCFC-free.

C. Tapered Insulation: Provide factory-tapered insulation boards fabricated to slope indicated in the Drawings.

D. Provide preformed saddles, crickets, tapered edge strips, and other insulation shapes where indicated for sloping to drain. Fabricate to slopes indicated.
   1. Maintain a minimum 4 inch insulation thickness at roof drains.

2.5 **INSULATION ACCESSORIES**

A. General: Furnish roof insulation accessories recommended by insulation manufacturer for intended use and compatibility with membrane roofing.

B. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening roof insulation and cover boards to substrate, and acceptable to roofing system manufacturer. Insulation and roof membrane are to be installed using a fully adhered system. Use mechanical fasteners only where required.

C. Cold Fluid-Applied Insulation Adhesive: Manufacturer’s standard cold-applied adhesive formulated to attach roof insulation to substrate or to another insulation layer.

D. Roof Sheathing / Cover Board: ASTM C 1177/C 1177M, glass-mat, water-resistant gypsum substrate, 1/4 inch thick.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Georgia-Pacific Corporation; Dens Deck Prime.

**PART 3 - EXECUTION**

3.1 **EXAMINATION**

A. Examine substrates, areas, and conditions, with Installer present, for compliance with the following requirements and other conditions affecting performance of roofing system:
   1. Verify that roof openings and penetrations are in place and curbs are set and braced and that roof drain bodies are securely clamped in place.
   2. Verify that wood blocking, curbs, and nailers are securely anchored to roof deck at penetrations and terminations and that nailers match thicknesses of insulation.
   3. Verify that minimum concrete drying period recommended by roofing system manufacturer has passed.
4. Verify that concrete substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
5. Verify that concrete curing compounds that will impair adhesion of roofing components to roof deck have been removed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean substrate of dust, debris, moisture, and other substances detrimental to roofing installation according to roofing system manufacturer's written instructions. Remove sharp projections.

B. Prevent materials from entering and clogging roof drains and conductors and from spilling or migrating onto surfaces of other construction. Remove roof-drain plugs when no work is taking place or when rain is forecast.

C. Complete terminations and base flashings and provide temporary seals to prevent water from entering completed sections of roofing system at the end of the workday or when rain is forecast. Remove and discard temporary seals before beginning work on adjoining roofing.

3.3 AIR & VAPOR BARRIER INSTALLATION

A. Install air and vapor barrier over concrete deck after manufacturer's recommended concrete primer has been applied.

B. Completely seal air and vapor barrier at terminations, obstructions, and penetrations to prevent air movement into membrane roofing system.

3.4 INSULATION INSTALLATION

A. Coordinate installing membrane roofing system components so insulation is not exposed to precipitation or left exposed at the end of the workday.

B. Comply with membrane roofing system and insulation manufacturer's written instructions for installing roof insulation.

C. Install tapered insulation under area of roofing to conform to slopes indicated.

D. Install insulation under area of roofing to achieve required thickness. Where overall insulation thickness is 2.7 inches or greater, install two or more layers with joints of each succeeding layer staggered from joints of previous layer a minimum of 6 inches in each direction.

E. Trim surface of insulation where necessary at roof drains so completed surface is flush and does not restrict flow of water.

F. Install insulation with long joints of insulation in a continuous straight line with end joints staggered between rows, abutting edges and ends between boards. Fill gaps exceeding 1/4 inch with

1. Cut and fit insulation within 1/4 inch of nailers, projections, and penetrations.

G. Adhered Insulation: Install each layer of insulation and adhere to substrate as follows:

1. Set each layer of insulation in a uniform coverage of full-spread insulation adhesive, firmly pressing and maintaining insulation in place.

H. Install cover boards over insulation with long joints in continuous straight lines with end joints staggered between rows. Offset joints of insulation below a minimum of 6 inches in each direction. Loosely butt cover boards together and fasten to roof deck.
1. Fasten cover boards according to requirements in FM Approvals’ "RoofNav" for specified Windstorm Resistance Classification.
2. Fasten cover boards to resist uplift pressure at corners, perimeter, and field of roof.

3.5 ADHERED MEMBRANE ROOFING INSTALLATION

A. Adhere membrane roofing over area to receive roofing according to membrane roofing system manufacturer's written instructions. Unroll membrane roofing and allow to relax before installing.

B. Start installation of membrane roofing in presence of membrane roofing system manufacturer's technical personnel.

C. Accurately align membrane roofing and maintain uniform side and end laps of minimum dimensions required by manufacturer. Stagger end laps.

D. Bonding Adhesive: Apply to substrate and underside of membrane roofing at rate required by manufacturer and allow to partially dry before installing membrane roofing. Do not apply to splice area of membrane roofing.

E. Mechanically or adhesively fasten membrane roofing securely at terminations, penetrations, and perimeters.

F. Apply membrane roofing with side laps shingled with slope of roof deck where possible.

G. Adhesive Seam Installation: Clean both faces of splice areas, apply splicing cement, and firmly roll side and end laps of overlapping membrane roofing according to manufacturer's written instructions to ensure a watertight seam installation. Apply lap sealant and seal exposed edges of membrane roofing terminations.
   1. Apply a continuous bead of in-seam sealant before closing splice if required by membrane roofing system manufacturer.

H. Repair tears, voids, and lapped seams in roofing that does not comply with requirements.

I. Spread sealant or mastic bed over deck drain flange at roof drains and securely seal membrane roofing in place with clamping ring.

3.6 BASE FLASHING INSTALLATION

A. Install sheet flashings and preformed flashing accessories and adhere to substrates according to membrane roofing system manufacturer's written instructions.

B. Apply bonding adhesive to substrate and underside of sheet flashing at required rate and allow to partially dry. Do not apply to seam area of flashing.

C. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

D. Clean splice areas, apply splicing cement, and firmly roll side and end laps of overlapping sheets to ensure a watertight seam installation. Apply lap sealant and seal exposed edges of sheet flashing terminations.

E. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars.

3.7 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified independent testing agency to perform inspections.
B. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion.

C. Repair or remove and replace components of membrane roofing system where inspections indicate that they do not comply with specified requirements.

D. Additional inspections, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.8 PROTECTING AND CLEANING

A. Protect membrane roofing system from damage and wear during remainder of construction period. When remaining construction will not affect or endanger roofing, inspect roofing for deterioration and damage, describing its nature and extent in a written report, with copies to Architect and Owner.

B. Correct deficiencies in or remove membrane roofing system that does not comply with requirements, repair substrates and repair or reinstall membrane roofing system to a condition free of damage and deterioration at time of Substantial Completion and according to warranty requirements.

C. Clean overspray and spillage from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

3.9 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Plan and coordinate roofing work to minimize the generation or cutoffs and waste.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.
   1.
SECTION 07 61 00 – FLAT SEAM METAL ROOFING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Flat-seam metal roofing, custom fabricated on site.

B. Related Sections:
   1. Division 06 Section "Sheathing."
   2. Division 07 Section "Thermal Insulation" for roof insulation.
   3. Division 07 Section "Sheet Metal Flashing and Trim" for copings, and flashings that are not part of sheet metal roofing.
   4. Division 07 Section "Joint Sealants" for field-applied sealants adjoining sheet metal roofing.

C. Definitions: The trade name “Freedom Grey” is used in this and other Sections of these Specifications to abbreviate the term “Zinc-Tin Alloy Coated Copper.” Use of this term is not intended to limit product selection to “Freedom Grey” Architectural Copper, as produced by Revere Copper Products, Inc., and acceptable equivalents will be considered, subject to compliance with all requirements.

1.3 PERFORMANCE REQUIREMENTS

A. General Performance: Sheet metal roofing system including, but not limited to, metal roof panels, cleats, clips, anchors and fasteners, sheet metal flashing integral with sheet metal roofing, fascia panels, trim, underlayment, and accessories shall comply with requirements indicated without failure due to defective manufacture, fabrication, installation, or other defects in construction. Sheet metal roofing shall remain watertight.

B. Roofing System Design:
   1. Corner Uplift Pressure: As determined by design criteria and applicable building codes indicated on the Drawings.
   2. Perimeter Uplift Pressure: As determined by design criteria and applicable building codes indicated on the Drawings.
   3. Field-of-Roof Uplift Pressure: As determined by design criteria and applicable building codes indicated on the Drawings.

C. Thermal Movements: Provide sheet metal roofing that allows for thermal movements from ambient and surface temperature changes. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
   1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each manufactured product and accessory.
B. Shop Drawings: Show fabrication and installation layouts of sheet metal roofing, including plans, elevations, expansion joint locations, and keyed details. Distinguish between shop- and field-assembled work. Include the following:
   1. Details for forming sheet metal roofing and sheet metal ceiling panels, including seams and dimensions.
   2. Details for joining and securing sheet metal roofing and sheet metal ceiling panels, including layout of fasteners, cleats, clips, and other attachments. Include pattern of seams.
   3. Details of termination points and assemblies, including fixed points.
   4. Details of expansion joints, including showing direction of expansion and contraction.
   5. Details of roof penetrations.
   6. Details of edge conditions, including eaves, ridges, valleys, rakes, crickets, and counterflashings.
   7. Details of special conditions.
   8. Details of connections to adjoining work.
   9. Detail the following accessory items, at a scale of not less than 3 inches per 12 inches:
      a. Flashing and trim.
      b. Gutters and downspouts as they relate to adjacent sheet metal roofing.

C. Samples for Initial Selection: For each type of sheet metal roofing and ceiling panel indicated, with factory-applied color finishes.
   1. Include similar Samples of trim and accessories involving color selection.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below:
   1. Sheet Metal Roofing and Ceiling Panel: 12 inches long by actual width of unit, including finished seam and in required profile. Include fasteners, cleats, clips, and other attachments.
   2. Trim and Metal Closures: 12 inches long and in required profile. Include fasteners and other exposed accessories.
   3. Other Accessories: 12-inch long Samples for each type of other accessory.

E. Coordination Drawings: Roof plans and reflected ceiling plans drawn to scale with coordinated details for penetrations and roof-mounted items.

F. Qualification Data: For qualified Installer/fabricator.

G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.

H. Maintenance Data: For roofing sheet metals and accessories to include in maintenance manuals.

I. Warranties: Sample of special warranties.

1.5 QUALITY ASSURANCE

A. Custom-Fabricated Sheet Metal Roofing Fabricator Qualifications: Shop that employs skilled workers who custom fabricate sheet metal roofing similar to that required for this Project and whose products have a record of successful in-service performance. Provide documentation for five (5) roof installations on projects of similar size and scope in the Pennsylvania, New York or New England region during the last ten (10) years.

B. Copper Roofing Standard: Comply with CDA's "Copper in Architecture Handbook." Conform to dimensions and profiles shown unless more stringent requirements are indicated.

C. Sheet Metal Roofing Standard: Comply with "Copper & Common Sense" by Revere Copper Products, Inc., unless more stringent requirements are specified or shown on the Drawings.
D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
1. As sheet metal work proceeds, build mockups of each type of roof and ceiling area, including accessories.
   a. Size: 4’ x 8’
   b. Flat seam roof.
   c. Include every type of joint and termination in mockup.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

E. Preliminary Roofing Conference: Before starting roof deck and/or sheathing construction, conduct conference at Project site. Comply with requirements for pre-installation conferences in Division 01 Section "Project Management and Coordination."
1. Review methods and procedures related to roof deck and/or sheathing construction and sheet metal roofing including, but not limited to, items listed for the Pre-installation Conference.

F. Pre-installation Conference: Conduct conference at Project site.
1. Meet with Owner, Architect, Owner's insurer if applicable, sheet metal roofing Installer and installers whose work interfaces with or affects sheet metal roofing.
2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
3. Review methods and procedures related to sheet metal roofing installation.
4. Examine sheathing conditions for compliance with requirements, including flatness and attachment to structural members.
5. Review structural loading limitations of roof framing and sheathing during and after roofing installation.
6. Review flashings, special roofing details, roof drainage, roof penetrations, and condition of other construction that will affect sheet metal roofing.
7. Review governing regulations and requirements for insurance, certificates, and testing and inspecting if applicable.
8. Review temporary protection requirements for sheet metal roofing during and after roofing installation.
10. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not store sheet metal roofing materials in contact with other materials that might cause staining, denting, or other surface damage. Store sheet metal roofing materials away from uncured concrete and masonry.

B. Protect strippable protective covering on sheet metal roofing from exposure to sunlight and high humidity, except to the extent necessary for the period of sheet metal roofing installation.

1.7 COORDINATION

A. Coordinate sheet metal roofing with rain drainage work, flashing, trim, and construction of metal decks, sheathing, parapets, walls, and other adjoining work to provide a leak proof, secure, and noncorrosive installation.
1.8 WARRANTY

A. Special Warranty: Warranty form at the end of this Section in which Installer agrees to repair or replace components of sheet metal roofing that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures, including but not limited to rupturing, cracking, or puncturing.
      b. Wrinkling or buckling.
      c. Loose parts.
      d. Failure to remain weathertight, including uncontrolled water leakage.
      e. Deterioration of metals, metal finishes, and other materials beyond normal weathering, including non-uniformity of color or finish.
      f. Galvanic action between sheet metal roofing and dissimilar materials.
   2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ROOFING SHEET METALS

A. General: Protect mechanical and other finishes on exposed surfaces from damage by applying a strippable, temporary protective film before shipping.

B. Zinc-Tin Alloy-Coated Copper Sheet: ASTM B 370, cold-rolled copper sheet, H00 temper, coated on both sides with a zinc-tin alloy (50 percent zinc, 50 percent tin).
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Revere Copper Products, Inc.; FreedomGray.
   2. Weight (Thickness): 16-oz./sq. ft. uncoated weight, with 0.787-mil coating thickness applied to each side.

2.2 UNDERLAYMENT MATERIALS

A. Self-Adhering, High-Temperature Sheet: Minimum 30 to 40 mils thick, consisting of slip-resisting polyethylene-film top surface laminated to layer of butyl or SBS-modified asphalt adhesive, with release-paper backing; cold applied. Provide primer when recommended by underlayment manufacturer.
   2. Low-Temperature Flexibility: ASTM D 1970; passes after testing at minus 20 deg F.
   3. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Carlisle Coatings & Waterproofing Inc.; CCW WIP 300HT.
      c. Henry Company; Blueskin PE200 HT.
      d. Metal-Fab Manufacturing, LLC; MetShield.
      e. Owens Corning; WeatherLock Metal High-Temperature Underlayment.

B. Slip Sheet: Building paper, 3-lb/100 sq. ft. minimum, rosin sized.

2.3 MISCELLANEOUS MATERIALS

A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for a complete roofing and ceiling system and as recommended by fabricator for sheet metal roofing.
B. Fasteners: Wood screws, annular-threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads.
   1. Fasteners for Zinc-Tin Alloy-Coated Copper Sheet: Copper, hardware bronze, or Series 300 stainless steel.

C. Solder:
   1. For Zinc-Tin Alloy-Coated Copper: ASTM B 32, 100 percent tin.

D. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.

E. Elastomeric Sealant: ASTM C 920, elastomeric polyurethane, polysulfide, or silicone polymer sealant as recommended by portable roll-forming equipment manufacturer for installation indicated; low modulus; of type, grade, class, and use classifications required to seal joints in sheet metal roofing and remain watertight.

F. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.4 ACCESSORIES

A. Sheet Metal Accessories: Provide components required for a complete sheet metal roofing assembly including trim, copings, fasciae, corner units, clips, flashings, sealants, gaskets, fillers, metal closures, closure strips, and similar items. Match material and finish of sheet metal roofing unless otherwise indicated.
   1. Provide accessories as recommended by portable roll-forming equipment manufacturer to produce sheet metal roofing assemblies that comply with UL 580 for wind-uplift resistance classification specified in "Quality Assurance" Article.
   2. Cleats: For mechanically seaming into joints and formed from the following materials:
      a. Zinc-Tin Alloy-Coated Copper Roofing: Cleats to be same material and weight as the roofing or wall cladding material.
   3. Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin foam or closed-cell laminated polyethylene; minimum 1-inch-thick, flexible-closure strips; cut or premolded to match sheet metal roofing profile. Provide closure strips where indicated or necessary to ensure weathertight construction.
   4. Flashing and Trim: Formed from same material and with same finish as sheet metal roofing and ceiling, minimum thickness matching the sheet metal roofing.
   5. Fins & Edge Strips: Heavy gage projecting metal elements illustrated in the Drawings including projecting edge strips at reveals.
      a. 32 oz. Zinc-Tin Alloy-Coated Copper.
      b. Solid bronze bar stock as shown in Drawings.

2.5 FABRICATION

A. General: Custom fabricate sheet metal roofing to comply with details shown and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions (panel width and seam height), geometry, metal thickness, and other characteristics of installation indicated. Fabricate sheet metal roofing and accessories at the shop to greatest extent possible.
   1. Flat-Seam Roofing: Form flat-seam panels from metal sheets 20 by 28 inches with 1/2-inch notched and folded edges.

B. Fabrication Tolerances: Fabricate sheet metal roofing and ceiling panels that are capable of installation to a tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.
C. Form exposed sheet metal work to fit substrates without excessive oil canning, buckling, and tool marks; true to line and levels indicated; and with exposed edges folded back to form hems.
1. Lay out sheet metal roofing so transverse seams, if required, are made in direction of flow with higher panels overlapping lower panels.
2. Offset transverse seams from each other 12 inches minimum.
3. Form and fabricate sheets, seams, strips, cleats, edge treatments, integral flashings, and other components of metal roofing to profiles, patterns, and drainage arrangements shown on Drawings and as required for leak proof construction.

D. Expansion Provisions: Fabricate sheet metal roofing to allow for expansion in running work sufficient to prevent leakage, damage, and deterioration of the Work. Where lapped expansion provisions cannot be used, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with butyl sealant concealed within joints.

E. Sealant Joints: Where movable, nonexpansion-type joints are indicated or required to produce weathertight seams, form metal to provide for proper installation of elastomeric sealant in compliance with SMACNA standards.

F. Metal Protection: Where dissimilar metals will contact each other, protect against galvanic action by painting contact surfaces with bituminous coating, by applying self-adhering sheet underlayment to each contact surface, or by other permanent separation as recommended by fabricator of sheet metal roofing or manufacturers of the metals in contact.

G. Sheet Metal Accessories: Custom fabricate flashings and trim to comply with recommendations in SMACNA’s "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated. Obtain field measurements for accurate fit before shop fabrication.
1. Form exposed sheet metal accessories without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.
2. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
3. Fabricate cleats and attachment devices of sizes as recommended by SMACNA's "Architectural Sheet Metal Manual" for application, but not less than thickness of metal being secured.

H. Do not use graphite pencils to mark metal surfaces.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, substrate, and other conditions affecting performance of the Work.
1. Examine solid roof and ceiling sheathing to verify that sheathing joints are supported by framing or blocking, that tops of fasteners are flush with surface, and that installation is within flatness tolerances required for finished roofing installation.
2. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and completely anchored, and that provision has been made for drainage, flashings, and penetrations through sheet metal roofing.

B. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
C. Examine roughing-in for components and systems penetrating sheet metal roofing to verify actual locations of penetrations relative to seam locations of sheet metal roofing before installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 UNDERLAYMENT INSTALLATION

A. Self-Adhering Sheet Underlayment: Install self-adhering sheet underlayment, wrinkle free, on roof sheathing under sheet metal roofing. Apply primer if required by underlayment manufacturer. Comply with temperature restrictions of underlayment manufacturer for installation; use primer rather than nails for installing underlayment at low temperatures. Apply at locations indicated, in shingle fashion to shed water, with end laps of not less than 6 inches staggered 24 inches between courses. Overlap side edges not less than 3-1/2 inches. Roll laps with roller. Cover underlayment within 14 days.
1. Cover entire vestibule roof with self-adhering sheet underlayment.

B. Install flashings to cover underlayment to comply with requirements in Division 07 Section "Sheet Metal Flashing and Trim."

C. Apply slip sheet before installing sheet metal roofing.

3.3 INSTALLATION, GENERAL

A. General: Anchor sheet metal roofing and other components of the Work securely in place, with provisions for thermal and structural movement. Install fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for a complete roofing system and as recommended by fabricator for sheet metal roofing.
1. Field cutting of sheet metal roofing by torch is not permitted.
2. Locate and space fastenings in uniform vertical and horizontal alignment. Predrill panels for fasteners.
3. Install sealant tape where indicated.
4. Lap metal flashing over sheet metal roofing to allow moisture to run over and off the material.
5. Do not use graphite pencils to mark metal surfaces.

B. Thermal Movement. Rigidly fasten metal roof panels to structure at only one location for each panel. Allow remainder of panel to move freely for thermal expansion and contraction.
1. Point of Fixity: Fasten each panel along a single line of fixing located at center of panel length.
2. Avoid attaching accessories through roof panels in a manner that will inhibit thermal movement.

C. Fasteners: Use fasteners of sizes that will penetrate wood sheathing not less than 1-1/4 inches for nails and not less than 3/4 inch for wood screws.

D. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying self-adhering sheet underlayment to each contact surface, or by other permanent separation as recommended by SMACNA.

E. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.
3.4 CUSTOM-FABRICATED FLAT SEAM SHEET METAL ROOFING INSTALLATION

A. Fabricate and install work with lines and corners of exposed units true and accurate. Form exposed faces flat and free of buckles, excessive waves, and avoidable tool marks, considering temper and reflectivity of metal. Provide uniform, neat seams with minimum exposure of solder, welds, and sealant. Fold back sheet metal to form a hem on concealed side of exposed edges unless otherwise indicated.
   1. Install cleats to hold sheet metal panels in position. Attach each cleat with two fasteners to prevent rotation.
   2. Fasten cleats not more than 12 inches o.c. Bend tabs over fastener head.
   3. Provide expansion-type cleats and clips for roof panels that exceed 30 feet in length.

B. Seal joints as shown and as required for watertight construction. For roofing with 3:12 slopes or less, use cleats at transverse seams.
   1. Where sealant-filled joints are used, embed hooked flanges of joint members not less than 1 inch into sealant. Form joints to completely conceal sealant. When ambient temperature at time of installation is moderate, between 40 and 70 deg F, set joint members for 50 percent movement each way. Adjust setting proportionately for installation at higher ambient temperatures. Do not install sealant-type joints at temperatures below 40 deg F.
   2. Prepare joints and apply sealants to comply with requirements in Division 07 Section "Joint Sealants."

C. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets to be soldered to a width of 1-1/2 inches, except reduce pre-tinning where pre-tinned surface would show in completed Work.
   1. Do not pre-tin zinc-tin alloy-coated copper.
   2. Do not use torches for soldering. Heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.
   3. Copper Roofing: Tin edges of uncoated copper sheets, using solder for copper.

D. Flat-Seam Roofing: Attach flat-seam metal panels to substrate with cleats, starting at eave and working upward toward ridge. After panels are in place, mallet seams and solder.
   1. Attach roofing panels with cleats spaced not more than 24 inches o.c.. Lock and solder panels to base flashing.
   2. Attach edge flashing to face of roof edge with continuous cleat fastened to roof substrate at 12 inches o.c. Lock panels to edge flashing and solder.

3.5 ACCESSORY INSTALLATION

A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.
   1. Install components required for a complete sheet metal roofing assembly including trim, copings, seam covers, flashings, sealants, gaskets, fillers, metal closures, closure strips, and similar items.

B. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and "Copper & Common Sense." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.
   1. Install flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, eaves, rakes, corners, bases, framed openings, ridges, fasciae, and fillers.
   2. Install continuous strip of self-adhering underlayment at edge of continuous flashing overlapping self-adhering underlayment, where "continuous seal strip" is indicated in "Copper & Common Sense," and where indicated on Drawings.
3. Install exposed flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.

4. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep and filled with butyl sealant concealed within joints.

3.6 ROOF DRAINAGE SYSTEM INSTALLATION

A. General: Install sheet metal roof drainage items to product complete roof drainage system according to “Copper & Common Sense” recommendations and as indicated.

B. Coordinate with the requirements of the roof and gutter ice melt system.

3.7 ERECTION TOLERANCES

A. Installation Tolerances: Shim and align sheet metal roofing within installed tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

3.8 CLEANING AND PROTECTION

A. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

B. Clean and neutralize flux materials. Clean off excess solder.

C. Clean off excess sealants.

D. Remove temporary protective coverings and strippable films as sheet metal roofing is installed unless otherwise indicated in manufacturer’s written installation instructions. On completion of sheet metal roofing installation, clean finished surfaces as recommended by sheet metal roofing manufacturer. Maintain sheet metal roofing in a clean condition during construction.

E. Replace sheet metal roofing components that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

3.9 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.
END OF SECTION 07 61 00
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Manufactured Products:
   a. Manufactured through-wall flashing and counterflashing.
   b. Manufactured reglets and counterflashing.

2. Formed Products:
   a. Formed roof drainage sheet metal fabrications.
   b. Formed low-slope roof sheet metal fabrications.
   c. Formed wall sheet metal fabrications.
   d. Formed equipment support flashing.
   e. Formed overhead-piping safety pans.

B. Related Sections: Sheet metal flashing and trim work related to the work specified in the following Sections is work of the following Sections but shall also comply with the requirements of this Section. The additional requirements specified under this section include, but are not limited to, detailed coordination of shop drawings, materials, and installation with work specified in the following Sections:

1. Division 04 Section "Unit Masonry" and "Stone Masonry" for installing sheet metal flashing and trim integral with masonry work.
2. Division 06 Section "Rough Carpentry" for wood nailers, curbs, and blocking.
3. Division 07 Section "Self-Adhering Sheet Waterproofing" for installing sheet metal flashing and trim integral with waterproofing work.
4. Division 07 Section "EPDM Roofing" for installing sheet metal flashing and trim integral with membrane roofing.
5. Division 07 Section "Flat Seamed Metal Roofing" for custom-formed sheet metal flashing and trim integral with metal siding.
6. Division 07 Section "Roof Accessories" for set-on-type curbs, equipment supports, roof hatches, vents, and other manufactured roof accessory units.
7. Division 07 Section "Joint Sealants" for elastomeric sealants work related to sheet metal flashing and trim work.
8. Division 07 Section "Fluid-Applied Air and Vapor Barrier" for installation of sheet metal flashing and trim in conjunction with air and vapor barrier systems.
10. Divisions 22 through 28 for sheet metal flashing and trim work related to mechanical, plumbing, and electrical work. All mechanical, plumbing, and electrical systems flashing, counter flashing, and other sheet metal flashing and trim work not indicated as work of Divisions 22 through 28 is work of this section and shall be installed integral with related roofing or other work.

C. All concealed unpainted and exposed pre-finished sheet metal flashing and trim work for the entire project (interior and exterior) is work of this section except as otherwise indicated.
1.3 PERFORMANCE REQUIREMENTS

A. General: Sheet metal flashing and trim assemblies as indicated shall withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Completed sheet metal flashing and trim shall not rattle, leak, or loosen, and shall remain watertight.

B. Fabricate and install roof edge flashing and copings and other sheet metal flashing and trim capable of resisting the following forces according to recommendations in FMG Loss Prevention Data Sheet 1-49 for Wind Zone of project area.

C. Thermal Movements: Provide sheet metal flashing and trim that allows for thermal movements from ambient and surface temperature changes.
   1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated, submit manufacturer's product data, installation instructions and general recommendations for each specified sheet material and fabricated product, system, and accessory. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each manufactured product and accessory. Include data substantiating that materials and performance comply with specified requirements.

B. Shop Drawings: Show fabrication and installation layouts of sheet metal flashing and trim, including plans, elevations, expansion-joint locations, and keyed details. Submit complete shop drawings showing layout, joining, profiles, and anchorages of each fabricated item and system, including all counter-flashings and detail conditions; layouts at 1/4" scale, details at 3" scale. Distinguish between shop- and field-assembled work. Include the following:
   1. Identification of material, thickness, weight, and finish for each item and location in Project.
   2. Details for forming sheet metal flashing and trim, including profiles, shapes, seams, and dimensions.
   3. Details for joining, supporting, and securing sheet metal flashing and trim, including layout of fasteners, cleats, clips, and other attachments. Include pattern of seams.
   4. Details of termination points and assemblies, including fixed points.
   5. Details of expansion joints and expansion-joint covers, including showing direction of expansion and contraction.
   6. Details of edge conditions, including eaves, ridges, valleys, rakes, crickets, and counterflashings as applicable.
   7. Details of special conditions.
   8. Details of connections to adjoining work.
   9. Detail formed flashing and trim at a scale of not less than 3 inches per 12 inches.
   10. For copings, gutters, scuppers, downspouts and exposed flashing and trim submit complete shop drawings and details indicating layout with joint locations, joining, prefabricated corners, prefabricated transitions, concealed splices, expansion joints, profiles, accessories, flashing connections and relationship to supporting structure and to adjoining roof and wall construction.

C. Samples for Initial Selection: For each type of sheet metal flashing, trim, and accessory indicated with factory-applied color finishes involving color selection. Submit samples of each specified sheet material and fabricated product to be exposed as finish surfaces with the specified finishes in custom colors to match samples provided by the Architect.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below:
   1. Sheet Metal Flashing: 12 inches long by actual width of unit, including finished seam and in required profile. Include fasteners, cleats, clips, closures, and other attachments.
2. Trim, Metal Closures, Expansion Joints, Joint Intersections, and Miscellaneous Fabrications: 12 inches long and in required profile. Include fasteners and other exposed accessories.

3. Accessories and Miscellaneous Materials: Full-size Sample.

4. Prefinished Aluminum Samples: Samples to show full range to be expected for each color required.

5. For verification purposes submit completely finished samples of prefabricated welded corner units for each type of gravel stop and coping and finish required.

E. Qualification Data: For qualified fabricator. Qualification data for firms and persons specified in the "Quality Control" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

F. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product numbers, lot numbers, batch numbers, source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates.

1. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Architect and approved in writing.

G. Maintenance Data: For sheet metal flashing, trim, and accessories to include in maintenance manuals.

H. Warranty: Sample of special warranty.

I. Installation and fastening data showing compliance with FM Loss Prevention Data Sheet 1-49.

1.5 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom fabricate sheet metal flashing and trim similar to that required for this Project and whose products have a record of successful in-service performance.

B. Installer Qualifications: Engage an experienced Installer who has completed sheet metal flashing and trim work similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

C. Sheet Metal Flashing and Trim Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" unless more stringent requirements are specified or shown on Drawings.

D. Copper Sheet Metal Standard: Comply with CDA's "Copper in Architecture Handbook." Conform to dimensions and profiles shown unless more stringent requirements are indicated.

E. Shop Assembly: Preassemble items in the shop to the greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

F. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

1. Wall Mockup:
   a. Build mockup of typical wall area to include sheet metal flashing and trims typically associated with the following wall construction types:
      1) brick
      2) dimension stone
      3) aluminum curtain wall

2. Architect will issue drawings to further describe extent of mockup.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

G. Preinstallation Conference: Conduct conference at Project site.
   1. Meet with Owner, Architect, Owner's insurer if applicable, Installer, and installers whose work interfaces with or affects sheet metal flashing and trim including installers of roofing materials, roof accessories, unit skylights, and roof-mounted equipment.
   2. Review methods and procedures related to sheet metal flashing and trim.
   3. Examine substrate conditions for compliance with requirements, including flatness and attachment to structural members.
   4. Review special roof details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect sheet metal flashing.
   5. Document proceedings, including corrective measures and actions required, and furnish copy of record to each participant.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not store sheet metal flashing and trim materials in contact with other materials that might cause staining, denting, or other surface damage. Store sheet metal flashing and trim materials away from uncured concrete and masonry.

B. Protect strippable protective covering on sheet metal flashing and trim from exposure to sunlight and high humidity, except to the extent necessary for the period of sheet metal flashing and trim installation.

1.7 PROJECT CONDITIONS

A. Coordinate work of this section with interfacing and adjoining work for proper sequencing of each installation. Ensure best possible weather resistance and durability of the work and protection of materials and finishes.
   1. Each contractor responsible for sheet metal flashing and trim work shall furnish to other contractors responsible for adjoining work all reglets and other required accessories that are required to be installed by other contractor's in their work. Coordinate reglets and accessories with substrate type and flashing materials and systems. Coordinate installation with wall and roof systems.

1.8 WARRANTY

A. Special Warranty on Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace sheet metal flashing and trim that shows evidence of deterioration of factory-applied finishes within specified warranty period.
   1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
      a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
      b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
      c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
   2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SHEET METALS

A. General: Protect mechanical and other finishes on exposed surfaces from damage by applying a strippable, temporary protective film before shipping.
B. Aluminum Sheet: ASTM B 209, alloy as standard with manufacturer for finish required, with temper as required to suit forming operations and performance required.
   1. Surface: Smooth, flat.
   2. Exposed Coil-Coated Finishes:
      a. Metallic Fluoropolymer: AAMA 620. Three-coat fluoropolymer finish with suspended metallic flakes containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   3. Color: Match Architect's samples. Three colors will be used.
   4. Concealed Finish: Pretreat with manufacturer's standard white or light-colored acrylic or polyester backer finish, consisting of prime coat and wash coat with a minimum total dry film thickness of 0.5 mil.

C. Stainless-Steel Sheet: ASTM A 240/A 240M or ASTM A 666, Type 304, dead soft, fully annealed.
   1. Finish: 2D (dull, cold rolled).
   2. Surface: Smooth, flat.

D. Zinc-Tin Alloy-Coated Copper Sheet: ASTM B 370, cold-rolled copper sheet, H00 temper, of minimum uncoated weight (thickness) indicated; coated on both sides with a zinc-tin alloy (50 percent zinc, 50 percent tin).
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Revere Copper Products, Inc.; FreedomGray.
   2. Weight: Weights indicated in this Section and on the drawings refer to the uncoated weight of the copper sheet. All zinc-tin alloy-coated copper sheet material shall have a 0.787-mill coating thickness applied to each side.

2.2 MISCELLANEOUS MATERIALS

A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and recommended by manufacturer of primary sheet metal or manufactured item unless otherwise indicated.

B. Fasteners: Wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads and recommended by manufacturer of primary sheet metal or manufactured item.
   1. General: Blind fasteners or self-drilling screws, gasketed, with hex-washer head.
      b. Blind Fasteners: High-strength aluminum or stainless-steel rivets suitable for metal being fastened.
      c. Spikes and Ferrules: Same material as gutter; with spike with ferrule matching internal gutter width.
   2. Fasteners for Zinc-Tin Alloy-Coated Copper Sheet: Copper, hardware bronze or Series 300 stainless steel.
   3. Fasteners for Aluminum Sheet: Aluminum or Series 300 stainless steel.
   4. Fasteners for Stainless-Steel Sheet: Series 300 stainless steel.

C. Solder:
   1. For Stainless Steel: ASTM B 32, Grade Sn60, with an acid flux of type recommended by stainless-steel sheet manufacturer.
   2. For Zinc-Tin Alloy-Coated Copper: ASTM B 32, 100 percent tin.

D. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.
E. Elastomeric Sealant: ASTM C 920, elastomeric silicone polymer sealant; low modulus; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight. Comply with recommendations by sheet metal manufacturer and fabricator of components being sealed and comply with requirements for joint sealants as specified in Division 7 Section "Joint Sealants."

F. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.

G. Epoxy Seam Sealer: Two-part, noncorrosive, aluminum seam-cementing compound, recommended by aluminum manufacturer for exterior nonmoving joints in materials that are not pre-finished, including riveted joints.

H. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D 1187, compounded for 15 mil dry film thickness per coat.

I. Asphalt Roofing Cement: Subject to coordination with, and compliance with requirements indicated in, applicable Division 7 Sections, provide asphalt type ASTM D 4586, asbestos free, of consistency required for application.

J. Adhesives: Type recommended by sheet metal manufacturer for substrate and project conditions for waterproof and weather-resistant seaming and adhesive application of sheet metal, and formulated to comply with performance requirements indicated in section 1.3 above.

K. Foam Rubber Seal: Manufacturer's standard foam.

L. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of the counterflashing lower edge.

M. Joint Cap: Soft lead joint protection cap, Weather Cap, Inc., Model A4 or approved equal, at horizontal reglet into which stainless steel flashing is installed.

2.3 MANUFACTURED SHEET METAL FLASHING AND TRIM

A. Concealed Sheet Metal Flashing:
   1. Stainless-Steel Sheet: ASTM A 167, Type 302304, soft annealed, with No.2D finish, except where harder temper is required for forming or performance; minimum 0.0156 inch thick, unless otherwise indicated.

B. Reglets: Units of type, material, and profile indicated, formed to provide secure interlocking of separate reglet and counterflashing pieces, and compatible with flashing indicated and with substrate and installation condition indicated, with factory-mitered and -welded corners, transitions and junctions, and with interlocking counterflashing on exterior face, of same metal and finish as flashing.
   1. Concrete Type: Provide temporary closure tape to keep reglet free of concrete materials, special fasteners for attaching reglet to concrete forms, and guides to ensure alignment of reglet section ends.
   2. Masonry Type: Provide with offset top flange for embedment in masonry mortar joint.
   3. Flexible Flashing Retainer: Provide neoprene plastic or rubber accessory to secure roofing or stainless Steel flashing in reglet where clearance does not permit use of standard metal counterflushing or where Drawings show reglet without metal counterflushing.
   4. Basis-of-Design Product: Reglet Flashing System shall be Type A (at concrete) or Type B (at masonry) reglet and spring lock cap flashing as manufactured by Cheney Flashing Co. or approved equal, in dimensions as shown on the drawings. Reglets shall be compatible with and noncorrosive to flashing indicated or comparable product by one of the following:
      a. Cheney Flashing Company.
b. Fry Reglet Corporation.
c. Heckmann Building Products Inc.
d. Hickman, W. P. Company.
e. Hohmann & Barnard, Inc.; STF Sawtooth Flashing.
g. National Sheet Metal Systems, Inc.
h. Sandell Manufacturing Company, Inc.

5. Material: Stainless steel, 0.019 inch thick.

6. Surface-Mounted Type: Provide with slotted holes for fastening to substrate, with neoprene or other suitable weatherproofing washers, and with channel for sealant at top edge.

7. Concrete Type: Provide temporary closure tape to keep reglet free of concrete materials, special fasteners for attaching reglet to concrete forms, and guides to ensure alignment of reglet section ends.

8. Masonry Type: Provide with offset top flange for embedment in masonry mortar joint.

9. Accessories:
   a. Flexible-Flashing Retainer: Provide resilient plastic or rubber accessory to secure flexible flashing in reglet where clearance does not permit use of standard metal counterflashing or where Drawings show reglet without metal counterflashing.
   b. Counterflashing Wind-Restraint Clips: Provide clips to be installed before counterflashing to prevent wind uplift of counterflashing lower edge.

10. Finish: 2B, unless noted otherwise.

2.4 FABRICATION, GENERAL

A. General: Custom fabricate sheet metal flashing and trim to comply with recommendations in SMACNA’s "Architectural Sheet Metal Manual" and other recognized industry practices that apply to design, dimensions, geometry, metal thickness, and other characteristics of item indicated, and comply with additional requirements indicated on the drawings or specified herein. Fabricate items at the shop to greatest extent possible. Fabricate to fit substrates and result in waterproof and weather-resistant performance; with expansion provisions for running work, sufficient to permanently prevent leakage, damage or deterioration of the work. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal. Comply with material manufacturer instructions and recommendations for forming material.

1. Fabricate sheet metal flashing and trim in thickness or weight needed to comply with performance requirements, but not less than that specified for each application and metal.

2. Obtain field measurements for accurate fit before shop fabrication.

3. Form sheet metal flashing and trim without oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.

4. Conceal fasteners and expansion provisions. Exposed fasteners are not allowed on faces exposed to view unless unavoidable AND only with the Architect’s prior written approval. Where unavoidable and approved by the Architect, provide Phillips flat-head machine screws for exposed fasteners and match finish of exposed heads with material being fastened, unless otherwise indicated. Except as otherwise indicated fasteners shall be same metal as flashing/sheet metal, non-magnetic stainless steel or other noncorrosive metal as recommended by sheet manufacturer, and of size recommended by the manufacturer, for product and application indicated.

5. Provide for separation of metal from noncompatible metal or corrosive substrates by coating concealed surfaces at locations of contact, with asphalt mastic or other permanent separation as recommended by manufacturer and as confirmed to be compatible with, and approved by the manufacturer of, adjacent materials. All mastics, sealants, seam sealers, adhesives and similar products proposed for use shall be selected (and tested if required) to assure that they are compatible with adjacent materials.
B. Fabrication Tolerances: Fabricate sheet metal flashing and trim that is capable of installation to a
tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of
adjoining faces and of alignment of matching profiles.

C. Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric
sealant.

D. Expansion Provisions: Where lapped expansion provisions cannot be used, form expansion joints
of intermeshing hooked flanges, not less than 1 inch deep, filled with butyl sealant concealed within
joints.

E. Fabricate cleats and attachment devices from same material as accessory being anchored or from
compatible, noncorrosive metal recommended by sheet metal manufacturer.

F. Fabricate cleats and attachment devices of sizes as recommended by SMACNA's "Architectural
Sheet Metal Manual" and by FMG Loss Prevention Data Sheet 1-49 for application, but not less
than one gauge heavier than thickness of metal being secured.

G. Anchors and Inserts: Use non-ferrous metal or hot-dip galvanized anchors and inserts for exterior
installations and elsewhere as required for corrosion resistance. Use toothed steel or lead
expansion bolt devices for drilled-in-place anchors. Furnish inserts, as required, to be set into
cement or masonry work

H. Seams that are visible in finish construction: Fabricate nonmoving seams with flush butt-joint
soldered seams. For metal other than aluminum, tin edges to be seamed, form seams, and solder.
For work indicated to receive painted, coated, or lacquered finishes, pre-fabricate and solder
nonmoving seams prior to applying finishes.

I. Seams that are concealed in finish construction: Fabricate nonmoving seams with flat-lock seams.
For concealed materials that are pre-finished form seams and seal with elastomeric sealant unless
otherwise recommended by sealant manufacturer for intended use. For concealed materials that
are not pre-finished form seams and either solder or seal with epoxy seam sealer unless otherwise
recommended by manufacturer for intended use. If soldering is used for metal other than aluminum,
tin edges to be seamed, form seams, and solder.

J. Do not use graphite pencils to mark metal surfaces.

K. Separations: Provide for separation of metal from noncompatible metal or corrosive substrates by
coating concealed surfaces at locations of contact, with asphalt mastic or other permanent
separation as recommended by manufacturer and as confirmed to be compatible with, and
approved by the manufacturer of, adjacent materials.

L. Fabricate items to comply with requirements indicated, including those for quality, thickness and
finish of material as well as those indicating dimensions and details. Use heavier metal gages,
stiffeners or metal backing as required to produce surface flatness, free of "oil-canning", and to
impart sufficient strength for use indicated. If not otherwise indicated, provide the following
minimum thickness of metal. Comply with SMACNA "Architectural Sheet Metal Manual" and other
recognized industry practices for fabrication and installation details.
1. All aluminum exposed in finish construction: 0.063 inch thick, except as otherwise noted.
2. Aluminum base flashing: 0.040 inch thick
3. Aluminum counterflashing: 0.050 inch thick
4. Aluminum flashing receivers: 0.040 inch thick

M. Form sheet metal items in maximum lengths and keep joints to a minimum, except for exposed
sheet metal which shall have joints aligned with center line of roof beams, with center line of
mullions, OR submit shop drawings with joints located to be reviewed by Architect. Do not expose
cut edges of sheet metal except as shown. Fold back exposed ends of unsupported sheet metal to
form a 1/2" wide hem on the concealed side, or ease exposed edges with backing to a radius of
approximately 1/32". Form items with flat, flush surfaces, true to line and level, and without cracking and grain separation at bends.

N. Continuously weld all nonmoving joints and seams except where other methods of joining are indicated; grind welds smooth and flush on exposed surfaces prior to pre-finishing. Comply with AWS and other metal authorities.
   1. Use filler metals and welding procedures which will blend with and match the color of sheet metal being joined and will avoid discoloration at welds.

O. Provide straps, plates and brackets as required for support and anchorage of fabricated items to adjoining work.

2.5 COPING, ROOF EDGE AND ALL OTHER EXPOSED SHEET METAL FABRICATIONS, GENERAL:

A. Provide pre-finished factory-fabricated coping, roof edge and exposed sheet metal systems which are designed and fabricated to fit applications indicated and to perform optimally with respect to weather resistance, water-tightness, durability, strength, and uniform appearance.

B. Expansion provisions: Fabricate to allow controlled expansion in running lengths not only for movement of metal components in relationship to one another but also to adjoining dissimilar materials, including flashing and roofing membrane materials, in a manner which is sufficient to prevent water leakage, deformation or damage.

C. Form copings, roof edges and exposed sheet metal, including custom trim components, to the profiles shown, using minimum 0.063" sheet aluminum unless otherwise indicated or required to conform with referenced standards. Furnish all components required for support and installation systems. Fabricate systems to tightly close with adjoining work, and with weathertight joints at exterior installations. Coordinate dimensions and attachment methods with adjacent work.

D. Locate fasteners to be concealed except where unavoidable and subject to prior written approval by the Architect. Size to securely support the work and space to prevent buckling or waviness of the finished surface.

E. Drill and tap holes required for securing closures to other surfaces.

F. Provide gaskets of closed-cell sponge neoprene or non-curing sealing tape where shown or required for concealed, continuous seal at concealed splice plates and abutting surfaces.

G. Provide concealed support and 6" wide internal (concealed) splice plates at all joints (including custom trim closures) to hold meeting faces in flush alignment. Provide prefabricated miter trim members at corners and custom fabricated end and transition profiles where shown or required, with joints soldered or welded prior to finishing to form a watertight integral unit without distortion of the contour or the face. Conform to joint locations indicated.

H. Provide continuous hold-down cleat strips secured with 3/4" hot-dipped galvanized flat-head screws spaced maximum 16" on center.

2.6 LOW-SLOPE ROOF SHEET METAL FABRICATIONS

A. Custom Formed Fascias, Copings and Cornice Flashings: Custom fabricated metal assemblies. Provide accessories including inside and outside corners, special shapes and transitions with mitered corners that are soldered or welded watertight prior to applying finish.
   1. Fabricate in custom lengths required to comply with joint locations indicated below.
      a. Centerlines of curtainwall vertical mullions, if applicable.
   2. Furnish with continuous cleats to support edge of external leg and interior leg.
   3. Fabricate to dimensions and profiles indicated.
5. Fabricate from the following materials:
   a. Stainless steel: 0.016 inch.
   b. At slate shingle roof and other locations where indicated: Zinc-Tin Alloy-Coated Copper: Unless noted otherwise, provide the following:
      1) 16 oz./sq. ft. typical for trim less than 12 inches wide profiles
      2) 20 oz./sq. ft. for trim wider than 12 inch profiles.
      3) 32 oz./sq. ft. for running cleats and edge strips.

2.7 WALL SHEET METAL FABRICATIONS

A. Opening Flashings in Frame Construction: Fabricate head, sill, jamb, and similar flashings to extend 4 inches beyond wall openings. Form head and sill flashing with 2-inch-high, end dams. Fabricate from the following materials:
   1. Zinc-Tin Alloy-Coated Copper: Unless noted otherwise, provide the following:
      a. 16 oz./sq. ft. typical for trim less than 12 inches wide profiles
      b. 20 oz./sq. ft. for trim wider than 12 inch profiles.
      c. 32 oz./sq. ft. for running cleats and edge strips.
   2. Aluminum: **0.063 inch** thick.
   3. Stainless Steel: **0.016 inch** thick.

2.8 MISCELLANEOUS SHEET METAL FABRICATIONS

A. Overhead-Piping Safety Pans: Fabricate from the following materials:
   1. Stainless Steel: 0.025 inch thick.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions and other conditions affecting performance of the Work, and verify that Work may properly commence.
   1. Verify compliance with requirements for installation tolerances of substrates.
   2. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

B. Notify the Construction Manager and the Architect in writing of any unsatisfactory conditions. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

C. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the work shall constitute acceptance of the substrates and conditions.

D. Field Measurements: Perform sheet metal flashing and trim work in cooperation with other trades and Contractors. Where possible, verify size, location and placement of miscellaneous sheet metal flashing and trim work prior to fabrication. Coordinate field measurements and shop drawings with fabrication and shop assembly.

3.2 INSTALLATION, GENERAL

A. General: Comply with requirements indicated in the specifications and drawings, with manufacturer's installation instructions and recommendations, and with SMACNA "Architectural Sheet Metal Manual". Anchor sheet metal flashing and trim and other components of the Work
securely in place, with provisions for thermal and structural movement. Use fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system. Coordinate with installation of all related and adjacent construction and substrates to receive work of this section as required to ensure that each element of the work performs properly, and that combined elements are waterproof and weather-resistant. Anchor products included in this section securely to structural substrates, adequate to withstand lateral and thermal stresses as well as inward and outward loading pressures.

1. Locate and place flashing and sheet metal items plumb, level and in alignment with adjacent work. Install sheet metal flashing and trim true to line and levels indicated, with exposed edges folded back to form hems. Provide uniform, neat seams with minimum exposure of solder, welds, and sealant.

2. Install sheet metal flashing and trim to fit substrates and to result in watertight and weather-resistant performance. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.

3. Form tight joints with exposed connections accurately fitted together. Provide reveals and openings for sealants and joint fillers as required.

4. Space cleats not more than 12 inches apart. Anchor each cleat with two fasteners. Bend tabs over fasteners.

5. Install exposed sheet metal flashing and trim without oil canning, buckling, and tool marks.

6. Install sealant tape where indicated.

7. Torch cutting of sheet metal flashing and trim is not permitted.

8. Do not use graphite pencils to mark metal surfaces.

B. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating or by other permanent separation as recommended by SMACNA. Separate metal from noncompatible metal or corrosive substrates by coating concealed surfaces, at locations of contact, with asphalt mastic or other permanent separation as recommended by manufacturer and as confirmed to be compatible with, and approved by the manufacturer of, adjacent materials.

1. Coat back side of uncoated aluminum and stainless-steel sheet metal flashing and trim with bituminous coating or other permanent separation where flashing and trim will contact wood, ferrous metal, or cementitious construction.

2. Underlayment: Where installing metal flashing directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet or install a course of polyethylene sheet.

C. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at maximum of third points in each bay and aligning with center line of mullions OR submit shop drawings with joints located to be reviewed by Architect, with no joints allowed within 24 inches of corner or intersection. Use concealed splice backer plates. Where lapped expansion provisions using concealed splice backer plates cannot be used or would not be sufficiently watertight, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with sealant concealed within joints.

D. Counterflashings: Coordinate installation of counterflashings with installation of assemblies to be protected by counterflashings. Install counterflashings in reglets or receivers.

E. Equipment Support Flashing: Coordinate equipment support flashing and pre-fabricated flashing units installation with roofing and equipment installation. Weld or seal flashing to equipment support member. Install pre-fabricated units in accordance with manufacturer’s instructions.

F. Use concealed anchorages except for unavoidable conditions that have been approved in advance in writing by the Architect. Provide brass or lead washers fitted to screws where required to protect sheet metal surfaces and to make a weathertight connection.
G. Fastener Sizes: Use fasteners of sizes that will penetrate wood sheathing not less than 1-1/4 inches for nails and not less than 3/4 inch for wood screws, and metal decking not less than recommended by fastener manufacturer to achieve maximum pull-out resistance.

H. Sealed Joints: Form nonexpansion, but movable, joints in metal to accommodate elastomeric sealant to comply with SMACNA standards. Fill joint with sealant and form metal to completely conceal sealant. Seal joints as shown and as required for watertight construction.
   1. Where sealant-filled joints are used, embed hooked flanges of joint members not less than 1 inch into sealant. Form joints to completely conceal sealant. When ambient temperature at time of installation is moderate, between 40 and 70 deg F, set joint members for 50 percent movement each way. Adjust setting proportionately for installation at higher ambient temperatures. Do not install sealant-type joints at temperatures below 40 deg F.
   2. Prepare joints and apply sealants to comply with requirements in Division 07 Section "Joint Sealants."
   3. Use joint adhesive for nonmoving joints specified not to be soldered.

I. Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets to be soldered to a width of 1-1/2 inches, except reduce pre-tinning where pre-tinned surface would show in completed Work.
   1. Solder metallic-coated steel and aluminum sheet prior to applying finish.
   2. Pre-tinning is not required for zinc-tin alloy-coated stainless steel and zinc-tin alloy-coated copper.
   3. Do not use torches for soldering. Heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.
   4. Stainless-Steel Soldering: Tin edges of uncoated sheets using solder recommended for stainless steel and acid flux. Promptly remove acid flux residue from metal after tinning and soldering. Comply with solder manufacturer's recommended methods for cleaning and neutralization.
   5. Copper Soldering: Tin edges of uncoated copper sheets using solder for copper.

J. Rivets: Rivet joints in concealed uncoated aluminum where indicated and where necessary for strength. Use of rivets in exposed or visible locations is not permitted.

K. Seams: Except as otherwise indicated or specified, fabricate nonmoving seams in sheet metal with flat-lock seams. Tin edges to be seamed, form seams, and solder.

L. Provide concealed gaskets, flashing, sealants, and fillers, and install as the work progresses to make the installations weathertight and sealed.

M. Install reglets to receive counterflashing in manner and by methods indicated. Where shown in concrete, masonry or other work, furnish reglets to trades of such work for installation. Install counterflashing in reglets, either by snap-in seal arrangement, or by wedging in place for anchorage and filling reglet with mastic or elastomeric sealant, as indicated and depending on degree of sealant exposure.

N. Repair finishes damaged by cutting, welding, soldering and grinding operations required for shop fitting and jointing. Restore finishes and prime coats of paint so there is no evidence of corrective work. Return items which cannot be refinished in the field to the shop, make the required alterations, and refinish the entire unit or provide new units, at fabricator's option subject to the approval of the Architect.

3.3 ROOF FLASHING INSTALLATION

A. General: Install sheet metal flashing and trim to comply with performance requirements, sheet metal manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, set units true to line, and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.
B. Roof Edge Flashing: Anchor to resist uplift and outward forces according to recommendations in SMACNA's "Architectural Sheet Metal Manual" and as indicated. Interlock bottom edge of roof edge flashing with continuous cleat anchored to substrate at staggered 3-inch centers.

C. Roof Edge Flashing: Anchor to resist uplift and outward forces according to recommendations in FMG Loss Prevention Data Sheet 1-49 for specified wind zone and as indicated. Interlock bottom edge of roof edge flashing with continuous cleat anchored to substrate at 16-inch centers.

D. Copings: Anchor to resist uplift and outward forces according to recommendations in SMACNA's "Architectural Sheet Metal Manual" and as indicated.
   1. Interlock exterior bottom edge of coping with continuous cleat anchored to substrate at 16-inch centers.
   2. Anchor interior leg of coping with washers and screw fasteners through slotted holes at 24-inch centers.

E. Copings: Anchor to resist uplift and outward forces according to recommendations in FMG Loss Prevention Data Sheet 1-49 for specified wind zone and as indicated.

F. Pipe or Post Counterflashing: Install counterflashing umbrella with close-fitting collar with top edge flared for elastomeric sealant, extending a minimum of 4 inches over base flashing. Install stainless-steel draw band and tighten.

G. Counterflashing: Coordinate installation of counterflashing with installation of base flashing. Insert counterflashing in reglets or receivers and fit tightly to base flashing. Extend counterflashing 4 inches over base flashing. Lap counterflashing joints a minimum of 4 inches and bed with sealant. Secure in a waterproof manner by means of snap-in installation and sealant or lead wedges and sealant.

H. Roof-Penetration Flashing: Coordinate installation of roof-penetration flashing with installation of roofing and other items penetrating roof. Seal with sealant recommended by roofing membrane manufacturer and clamp flashing to pipes that penetrate roof.

3.4 WALL FLASHING INSTALLATION

A. General: Install sheet metal wall flashing to intercept and exclude penetrating moisture according to SMACNA recommendations and as indicated. Coordinate installation of wall flashing with installation of wall-opening components such as windows, doors, and louvers.

B. Through-Wall Flashing: Installation of through-wall flashing is specified in Division 04 Section "Unit Masonry."

C. Reglets: Installation of reglets is specified in Division 03 Section "Cast-in-Place Concrete" and in Division 04 Section "Unit Masonry."

D. Opening Flashings in Frame Construction: Install continuous head, sill, jamb, and similar flashings to extend 4 inches beyond wall openings.

3.5 MISCELLANEOUS FLASHING INSTALLATION

A. Overhead-Piping Safety Pans: Suspend pans independent from structure above as indicated on Drawings. Pipe and install drain line to plumbing waste or drainage system.

B. Equipment Support Flashing: Coordinate installation of equipment support flashing with installation of roofing and equipment. Weld or seal flashing with elastomeric sealant to equipment support member.
3.6 **ERECTION TOLERANCES**

A. Installation Tolerances: Shim and align sheet metal flashing and trim within installed tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

B. Installation Tolerances: Shim and align sheet metal flashing and trim within installed tolerances specified in MCA’s “Guide Specification for Residential Metal Roofing.”

3.7 **CLEANING AND PROTECTION**

A. Clean exposed metal surfaces in accordance with manufacturer's instructions, removing substances which might cause corrosion of metal or deterioration of finishes. Touch-up, or replace if so directed by the Architect, work with damaged metal coatings.

B. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

C. Clean and neutralize flux materials. Clean off excess solder.

D. Clean off excess sealants.

E. Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer's written installation instructions. On completion of installation, remove unused materials and clean finished surfaces. Maintain in a clean condition during construction.

F. Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures as directed by the Architect.

G. Protection: Installer shall advise Construction Manager of required procedures for protection of sheet metal flashing and trim work during construction. Provide final protection and maintain conditions that ensure sheet metal flashing and trim work is without damage or deterioration other than natural weathering at the time of Substantial Completion.

3.8 **WASTE MANAGEMENT**

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum, copper, stainless steel and steel.
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 62 00
SECTION 07 72 00 - ROOF ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Roof hatches.

B. Related Sections:
   1. Division 05 Section "Metal Fabrications" for metal vertical ladders, ships' ladders, and stairs for access to roof hatches.
   2. Division 07 steep-slope roofing Sections for ridge vents.
   3. Division 07 low-slope roofing Sections for roofing accessories.
   4. Division 07 Section "Slate Shingles" for ridge vents and snow guards for metal roof panels.
   5. Division 07 Section "Sheet Metal Flashing and Trim" for shop- and field-formed metal flashing, roof-drainage systems, roof expansion-joint covers, and miscellaneous sheet metal trim and accessories.
   6. Division 11 Section "Fall Restraint" for safety railing systems not attached to roof-hatch curbs.

1.3 PERFORMANCE REQUIREMENTS

A. General Performance: Roof accessories shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of roof accessory indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. Shop Drawings: For roof accessories. Include plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work.

C. Samples: For each exposed product and for each color and texture specified, prepared on Samples of size to adequately show color.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:
   1. Size and location of roof accessories specified in this Section.
   2. Method of attaching roof accessories to roof or building structure.
   3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
   4. Required clearances.

B. Warranty: Sample of special warranty.
1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For roof accessories to include in operation and maintenance manuals.

1.7 COORDINATION

A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.

B. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.

1.8 WARRANTY

A. Special Warranty on Painted Finishes: Manufacturer's standard form in which manufacturer agrees to repair finishes or replace roof accessories that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
   a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
   b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
   c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 METAL MATERIALS

A. Aluminum Sheet: ASTM B 209, manufacturer's standard alloy for finish required, with temper to suit forming operations and performance required.

   1. Exposed Coil-Coated Finish: Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

B. Aluminum Extrusions and Tubes: ASTM B 221, manufacturer's standard alloy and temper for type of use, finished to match assembly where used, otherwise mill finished.

2.2 MISCELLANEOUS MATERIALS

A. General: Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.

B. Cellulosic-Fiber Board Insulation: ASTM C 208, Type II, Grade 1, thickness as indicated.

C. Glass-Fiber Board Insulation: ASTM C 726, thickness as indicated.

D. Polyisocyanurate Board Insulation: ASTM C 1289, thickness as indicated.

E. Wood Nailers: Softwood lumber, pressure treated with waterborne preservatives for aboveground use, acceptable to authorities having jurisdiction, containing no arsenic or chromium, and complying with AWPA C2; not less than 1-1/2 inches thick.

F. Bituminous Coating: Cold-applied asphalt emulsion complying with ASTM D 1187.

G. Underlayment:
   1. Felt: ASTM D 226, Type II (No. 30), asphalt-saturated organic felt, nonperforated.
   2. Slip Sheet: Building paper, 3-lb/100 sq. ft. minimum, rosin sized.
H. Fasteners: Roof accessory manufacturer's recommended fasteners suitable for application and metals being fastened. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners. Furnish the following unless otherwise indicated:
   1. Fasteners for Aluminum Sheet: Aluminum or Series 300 stainless steel.

I. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, PVC, or silicone or a flat design of foam rubber, sponge neoprene, or cork.

J. Elastomeric Sealant: ASTM C 920, elastomeric silicone polymer sealant as recommended by roof accessory manufacturer for installation indicated; low modulus; of type, grade, class, and use classifications required to seal joints and remain watertight.

K. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for expansion joints with limited movement.

2.3 ROOF HATCH

A. Roof Hatches: Metal roof-hatch units with lids and insulated double-walled curbs, welded or mechanically fastened and sealed corner joints, continuous lid-to-curb counterflashing and weathertight perimeter gasketing, stepped integral metal cant raised the thickness of roof insulation, and integrally formed deck-mounting flange at perimeter bottom.
   1. Basis-of-Design: Subject to compliance with requirements, provide Enhanced Performance Roof Hatch E-50T as manufactured by The Bilco Company, or approved equal.

B. Type and Size: Single-leaf lid, 36 by 36 inches.

D. Hatch Material: Aluminum sheet, .090, with a 4” beaded flange with formed reinforcing members. Cover shall have a heavy extruded EPDM rubber gasket which is bonded to the cover interior to ensure a continuous seal when compressed to the top surface of the curb.
   1. Finish: Mill.
   2. To be field painted as directed by Architect.

E. Construction:
   1. Insulation: Cover and curb to be insulated with 2” thick polyisocyanurate with an R-value of 12. Insulation shall be fully covered and protected by an aluminum liner.
   2. Hatch Lid: Opaque, insulated, and double walled, with manufacturer's standard metal liner of same material and finish as outer metal lid.
   3. Curb Liner: Manufacturer's standard, of same material and finish as metal curb.
   4. On ribbed or fluted metal roofs, form flange at perimeter bottom to conform to roof profile.
   5. Fabricate curbs to minimum height of 12 inches unless otherwise indicated.
   6. Sloping Roofs: Where slope or roof deck exceeds 1:48, fabricate curb with perimeter curb height that is tapered to accommodate roof slope so that top surfaces of perimeter curb are level. Equip hatch with water diverter or cricket on side that obstructs water flow.

F. Hardware:
   1. Stainless-steel spring latch with turn handles, butt- or pintle-type hinge system, and padlock hasps inside and outside.
   2. Cover shall be equipped with spring latch with interior and exterior turn handles.
   3. Shall be equipped with interior and exterior padlock hasps.
      a. Provide padlock for interior hasp keyed to Owner's maintenance master. Provide 4 keys for lock.
   4. Cover shall automatically lock in the open position with a rigid hold open arm equipped with a vinyl grip handle to permit easy release for closing.
5. Compression spring operators enclosed in telescopic tubes. Upper tube shall be outer to prevent accumulation of moisture, grit and debris inside the lower tube assembly. Lower tube shall interlock with a flanged support shoe that is bolted to the curb assembly.

G. Safety Railing System: Roof-hatch manufacturer's standard system including rails, clamps, fasteners, safety barrier at railing opening, and accessories required for a complete installation; attached to roof hatch and complying with 29 CFR 1910.23 requirements and authorities having jurisdiction.
1. Height: 42 inches above finished roof deck.
2. Posts and Rails: Galvanized-steel pipe, 1-1/4 inches in diameter or galvanized-steel tube, 1-5/8 inches in diameter.
3. Flat Bar: Galvanized steel, 2 inches high by 3/8 inch thick.
5. Chain Passway Barrier: Galvanized proof coil chain with quick link on fixed end.
7. Post and Rail Tops and Ends: Weather resistant, closed or plugged with prefabricated end fittings.
8. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members.
9. Fabricate joints exposed to weather to be watertight.
10. Fasteners: Manufacturer's standard, finished to match railing system.
12. Required at one hatch location.

2.4 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

C. Verify dimensions of roof openings for roof accessories.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install roof accessories according to manufacturer's written instructions.
   1. Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.
   2. Anchor roof accessories securely in place so they are capable of resisting indicated loads.
   3. Use fasteners, separators, sealants, and other miscellaneous items as required to complete installation of roof accessories and fit them to substrates.
4. Install roof accessories to resist exposure to weather without failing, rattling, leaking, or loosening of fasteners and seals.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.
   1. Coat concealed side of uncoated aluminum or stainless-steel roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
   2. Underlayment: Where installing roof accessories directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet, or install a course of polyethylene sheet.

C. Roof-Hatch Installation:
   1. Install roof hatch so top surface of hatch curb is level.
   2. Verify that roof hatch operates properly. Clean, lubricate, and adjust operating mechanism and hardware.
   3. Attach safety railing system to roof-hatch curb.
   4. Attach ladder-assist post according to manufacturer’s written instructions.

D. Seal joints with elastomeric or butyl sealant as required by roof accessory manufacturer.

3.3 REPAIR AND CLEANING

A. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing according to ASTM A 780.

B. Touch up factory-primed surfaces with compatible primer ready for field painting according to Division 09 painting Sections.

C. Clean exposed surfaces according to manufacturer’s written instructions.

D. Clean off excess sealants.

E. Replace roof accessories that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 72 00
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Sprayed fire-resistive materials (SFRM).
   2. Thin-film intumescent mastic fire-resistive coatings.
   3. Surface preparation for coatings listed above.

B. Related Requirements:
   1. Division 09 Section "Structural Steel Framing" for surface conditions required for structural steel receiving SFRM.
   2. Division 07 Section “Penetration Firestopping” for fire-resistance-rated firestopping systems.
   3. Division 09 Sections “Interior Painting” for general painting.
      a. Thin film intumescent mastic fire-resistant coatings shall be compatible with primer paint and materials specified in other Sections.

C. It shall be clearly understood that all thin-film intumescent mastic fire-resistant coating work will be exposed in the finished construction and highly visible. The provision of a smooth, even and fine texture and uniform finish equivalent in appearance to applying a standard stipple enamel paint finish on steel is a contract requirement. Remedial work including grinding and sanding to remove surface imperfections and assure that material fibers will not be visible in the finished work shall be provided as required. The coating shall accurately follow the profiles of the steel members with sharp straight lines and special care and attention shall be given to flange edges, stiffener plates and holes through the steel members. Surface irregularities and imperfections including irregular lines, rough or irregular texture, laps, skid marks, brush marks, runs, sags, or ropiness shall be cause for rejection. Protective measures shall be provided to assure that there will be no overspray on to adjacent surfaces including steel decking, aluminum railing fabrications, steel hanger rods and fasteners, and stone. The Prime Contractor shall institute all measures and procedures necessary to assure that these finish quality requirements will be complied with including but not limited to applying the material in multiple thin coats to achieve the required performance thickness and utilizing experienced finishing personnel.

D. Stipple Enamel Finish for thin-film intumescent mastic fire-resistant coatings: Roll and redistribute paint o an even and fine texture. Leave no evidence of rolling such as laps, irregularity in texture, skid marks, or other surface imperfections.

E. Pigmented (Opaque) Finishes for thin film intumescent mastic fire-resistant coatings: Completely cover to provide an opaque, smooth surface of uniform finish, color, appearance and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness or other surface imperfections will not be acceptable.

1.3 DEFINITIONS

A. SFRM: Sprayed fire-resistant material.
B. Concealed: Fire-resistive materials applied to surfaces that are concealed from view behind other construction when the Work is completed and have not been defined as exposed.

C. Exposed: Fire-resistive materials applied to surfaces that are exposed to view when the Work is completed, that are accessible through suspended ceilings, that are in elevator shafts and machine rooms, that are in mechanical rooms, that are in air-handling plenums, that are visible through linear wood panel grille ceilings, that are concealed by ceiling construction above the mezzanine, and that are identified as exposed on Drawings.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.
   1. Review products, design ratings, restrained and unrestrained conditions, densities, thicknesses, bond strengths, and other performance requirements.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. LEED Submittals:
   1. Product Data for Credit EQ 4.2: For paints and coatings, documentation including printed statement of VOC content.

C. Shop Drawings: Framing plans, schedules, or both, indicating the following:
   1. Extent of fireproofing for each construction and fire-resistance rating.
   2. Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
   3. Minimum fireproofing thicknesses needed to achieve required fire-resistance rating of each structural component and assembly.
   4. Treatment of fireproofing after application.

D. Samples: For each exposed product and for each color and texture specified, in manufacturer's standard dimensions in size.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturer and testing agency.

B. Product Certificates: For each type of fireproofing.

C. Evaluation Reports: For fireproofing, from ICC-ES.

D. Preconstruction Test Reports: For fireproofing.

E. Field quality-control reports.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by fireproofing manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements.

B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution.
   1. Build mockup of each type of fireproofing and different substrate and each required finish as directed by Architect.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Owner will engage a qualified testing agency to perform preconstruction testing on field mockups of fireproofing.
   1. Provide test specimens and assemblies representative of proposed materials and construction.

B. Preconstruction Adhesion and Compatibility Testing: Test for compliance with requirements for specified performance and test methods.
   1. Bond Strength: Test for cohesive and adhesive strength according to ASTM E 736. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   2. Density: Test for density according to ASTM E 605. Provide density indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   3. Verify that manufacturer, through its own laboratory testing or field experience, attests that primers or coatings are compatible with fireproofing.
   4. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   5. For materials failing tests, obtain applied-fireproofing manufacturer's written instructions for corrective measures including the use of specially formulated bonding agents or primers.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to Project site in original, unopened packages with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, shelf life if applicable, and fire-resistance ratings applicable to Project.

B. Use materials with limited shelf life within period indicated. Remove from Project site and discard materials whose shelf life has expired.

C. Store materials inside, under cover, and aboveground; keep dry until ready for use. Remove from Project site and discard wet or deteriorated materials.

1.10 FIELD CONDITIONS

A. Environmental Limitations: Do not apply fireproofing when ambient or substrate temperature is 44 deg F or lower unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.

B. Ventilation: Ventilate building spaces during and after application of fireproofing, providing complete air exchanges according to manufacturer's written instructions. Use natural means or, if they are inadequate, forced-air circulation until fireproofing dries thoroughly.

1.11 COORDINATION

A. Sequence and coordinate application of SFRM with other related work specified in other Sections to comply with the following requirements:
   1. Provide temporary enclosure as required to confine spraying operations and protect the environment.
   2. Provide temporary enclosures for applications to prevent deterioration of fire-resistive material due to exposure to weather and to unfavorable ambient conditions for humidity, temperature, and ventilation.
3. Avoid unnecessary exposure of fire-resistant material to abrasion and other damage likely to occur during construction operations subsequent to its application.

4. Do not apply fire-resistant material to metal roof deck substrates until concrete topping, if any, has been completed. For metal roof decks without concrete topping, do not apply fire-resistant material to metal roof deck substrates until roofing has been completed; prohibit roof traffic during application and drying of fire-resistant material.

5. Do not apply fire-resistant material to metal floor deck substrates until concrete topping has been completed.

6. Do not begin applying fire-resistant material until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.

7. Defer installing ducts, piping, and other items that would interfere with applying fire-resistant material until application of fire protection is completed.

8. Do not install enclosing or concealing construction until after fire-resistant material has been applied, inspected, and tested and corrections have been made to defective applications.

1.12 WARRANTY

A. Special Warranty: Manufacturer's standard form, signed by Contractor and by Installer, in which manufacturer agrees to repair or replace SFRMs that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Cracking, flaking, spalling, or eroding in excess of specified requirements; peeling; or delaminating of SFRM from substrates.
   b. Not covered under the warranty are failures due to damage by occupants and Owner's maintenance personnel, exposure to environmental conditions other than those investigated and approved during fire-response testing, and other causes not reasonably foreseeable under conditions of normal use.

2. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Assemblies: Provide fireproofing, including auxiliary materials, according to requirements of each fire-resistance design and manufacturer's written instructions.

B. Source Limitations: Obtain fireproofing for each fire-resistance design from single source.

C. Fire-Resistance Design: Indicated on Drawings, tested according to ASTM E 119 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Steel members are to be considered unrestrained unless specifically noted otherwise.

D. VOC Content: Products shall comply with VOC content limits of authorities having jurisdiction[,] and the following VOC limits when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1. Flat Paints and Coatings: 50 g/L.
2. Nonflat Paints and Coatings: 150 g/L.
3. Primers, Sealers, and Undercoaters: 200 g/L.
4. Anticorrosive and Antirust Paints Applied to Ferrous Metals: 250 g/L.

E. Low-Emitting Materials: Fireproofing used within the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

F. Asbestos: Provide products containing no detectable asbestos.
2.2 CONCEALED SFRM

A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
   1. Concealed Cementitious SFRM:
      b. Isolatek International Corp.; Cafco 300.

B. Material Composition: Manufacturer's standard product, as follows:
   1. Concealed Cementitious SFRM: Factory-mixed, dry formulation of gypsum or portland cement binders, additives, and lightweight mineral or synthetic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.

C. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:
   1. Dry Density: 15 lb/cu. ft. for average and individual densities, or greater if required to attain fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method."
   2. Thickness: Minimum average thickness required for fire-resistance design indicated according to the following criteria, but not less than 0.375 inch, per ASTM E 605:
      a. Where the referenced fire-resistance design lists a thickness of 1 inch or more, the minimum allowable individual thickness of SFRM is the design thickness minus 0.25 inch.
      b. Where the referenced fire-resistance design lists a thickness of less than 1 inch but more than 0.375 inch, the minimum allowable individual thickness of SFRM is the greater of 0.375 inch or 75 percent of the design thickness.
      c. No reduction in average thickness is permitted for those fire-resistance designs whose fire-resistance ratings were established at densities of less than 15 lb/cu. ft.
   3. Bond Strength: 150 lbf/sq. ft. minimum per ASTM E 736 based on laboratory testing of 0.75-inch minimum thickness of SFRM.
   4. Compressive Strength: 5.21 lbf/sq. in. minimum per ASTM E 761. Minimum thickness of SFRM tested shall be 0.75 inch and minimum dry density shall be as specified but not less than 15 lb/cu. ft.
   6. Deflection: No cracking, spalling, or delamination per ASTM E 759.
   7. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
   8. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. in 24 hours per ASTM E 859. For laboratory tests, minimum thickness of SFRM is 0.75 inch, maximum dry density is 15 lb/cu. ft., test specimens are not prepurged by mechanically induced air velocities, and tests are terminated after 24 hours.
   9. Fire-Test-Response Characteristics: Provide SFRM with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
      a. Flame-Spread Index: 0.
      b. Smoke-Developed Index: 0.
   10. Fungal Resistance: No observed growth on specimens per ASTM G 21.

2.3 EXPOSED SFRM

A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
   1. Exposed Cementitious SFRM:
      b. Isolatek International Corp.; Cafco 400.

B. Material Composition: Manufacturer's standard product, as follows:
1. Exposed Cementitious SFRM: Factory-mixed, dry, cement aggregate formulation; or chloride-free formulation of gypsum or portland cement binders, additives, and inorganic aggregates mixed with water at Project site to form a slurry or mortar for conveyance and application.

C. Physical Properties: Minimum values, unless otherwise indicated, or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property as follows:
   1. Dry Density: Values for average and individual densities as required for fire-resistance ratings indicated, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method," but with an average density of not less than 22 lb/cu. ft.
   2. Bond Strength: 434 lbf/sq. ft. minimum per ASTM E 736.
   3. Compressive Strength: 51 lbf/sq. in. minimum per ASTM E 761.
   5. Deflection: No cracking, spalling, or delamination per ASTM E 759.
   6. Effect of Impact on Bonding: No cracking, spalling, or delamination per ASTM E 760.
   7. Air Erosion: Maximum weight loss of 0.025 g/sq. ft. per ASTM E 859.
   9. Fire-Test-Response Characteristics: Provide SFRM with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
      a. Flame-Spread Index: 0.
      b. Smoke-Developed Index: 0.
   10. Fungal Resistance: No observed growth on specimens per ASTM G 21.

2.4 EXPOSED THIN FILM INTUMESCENT MASTIC FIRE-RESISTIVE COATINGS

A. Basis-of-Design Product: Subject to compliance with requirements, provide “A/D Firefilm III” and “Carbocrylic 3350” topcoat, as manufactured by Carboline, or a comparable product.

B. Thin Film Fire-Resistant, Intumescent Mastic Coating: Factory-mixed formulation.
   1. Water-Based Formulation: Approved by manufacturer and authorities having jurisdiction and investigated for Conditioned Interior Space Purpose by UL.
   2. Multicomponent system consisting of intumescent base coat and topcoat.

C. Color and Gloss: Match Architect’s sample.

D. Credit EQ 4.2: For field applications that are inside the weatherproofing system, use paints and coatings that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D:
   1. Flat Paints, Coatings, and Primers: VOC not more than 50 g/L.
   2. Nonflat Paints, Coatings, and Primers: VOC not more than 150 g/L.
   3. Anticorrosive and Antirust Paints Applied to Ferrous Metals: VOC not more than 250 g/L.

E. Apply in thicknesses as required to achieve the required fire resistance rating indicated as recommended by the manufacturer, based on designs as tested by referenced testing agencies. If tests have not been performed on the actual steel shapes or sizes to be protected on this project, the manufacturer shall develop recommended thicknesses based on the test results that are available and their experience.

F. Color Top Coating: Subject to the fire resistive coating manufacturer’s confirmation that the color top coating materials are compatible with the fire-resistive mastic coating materials indicated, provide the manufacturer’s factory-formulated top color coat materials or the interior ferrous metal finish paint material as specified in Division 09 Section “Interior Painting.”
   1. Apply two coats in thicknesses indicated in Division 09 Section “Interior Painting,” except as otherwise recommended by the Thin Film Intumescent Mastic Fire Resistant Coating manufacturer to achieve the required fire resistance rating.
2.5 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that are compatible with fireproofing and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.

B. Substrate Primers: Primers approved by fireproofing manufacturer and complying with one or both of the following requirements:
   1. Primer and substrate are identical to those tested in required fire-resistance design by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
   2. Primer's bond strength in required fire-resistance design complies with specified bond strength for fireproofing and with requirements in UL's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction, based on a series of bond tests according to ASTM E 736.

C. Bonding Agent: Product approved by fireproofing manufacturer and complying with requirements in UL's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction.

D. Metal Lath: Expanded metal lath fabricated from material of weight, configuration, and finish required, according to fire-resistance designs indicated and fireproofing manufacturer's written recommendations. Include clips, lathing accessories, corner beads, and other anchorage devices required to attach lath to substrates and to receive fireproofing.

E. Reinforcing Fabric: Glass- or carbon-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated; approved and provided by fireproofing manufacturer.

F. Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance design indicated; approved and provided by fireproofing manufacturer. Include pins and attachment.

G. Sealer: Transparent-drying, water-dispersible, tinted protective coating recommended in writing by fireproofing manufacturer for each fire-resistance design.
   1. Product: Subject to compliance with requirements, provide "Cafco Bond-Seal" by Isolatek International.

H. Topcoat: Suitable for application over applied fireproofing; of type recommended in writing by fireproofing manufacturer for each fire-resistance design.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of the Work and according to each fire-resistance design. Verify compliance with the following:
   1. Substrates comply with requirements in the Section where the substrate and related materials and construction are specified.
   2. Substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, incompatible paints, incompatible encapsulants, or other foreign substances capable of impairing bond of fire-resistive materials with substrates under conditions of normal use or fire exposure.
   3. Objects penetrating fire-resistive material, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
4. Substrates are not obstructed by ducts, piping, equipment, and other suspended construction that will interfere with applying fire-resistive material.

5. Notify the Professional in writing of anticipated problems using the SFRM systems specified with substrates primed or furnished by others.

6. Submit written certification that the conditions and substrates are acceptable.

B. Verify that concrete work on steel deck has been completed before beginning fireproofing work.

C. Verify that roof construction, installation of roof-top HVAC equipment, and other related work is complete before beginning fireproofing work.

D. Conduct tests according to fireproofing manufacturer's written recommendations to verify that substrates are free of substances capable of interfering with bond.

E. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. General: Remove accessories, plates, machined surfaces, lighting fixtures, and similar items that are not to be coated, or provide surface-applied protection prior to surface preparation and coating. Remove these items, if necessary, to completely coat the items to be fireproofed. Mask off or otherwise protect items and adjacent surfaces (including the adjacent metal decking) that are not to be fireproofed. Following completion of coating operations in each space or area, reinstall items removed, using workers skilled in the trades involved.

B. Clean substrates of substances that could impair bond of fire-resistive material, including dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, and incompatible primers, paints, and encapsulants.

C. Schedule cleaning and coating application so dust and other contaminants will not fall on wet, newly coated surfaces.

D. Surface Preparation: Clean and prepare surfaces to be coated according to the manufacturer's instructions for the particular substrate conditions, and as specified. Surfaces to be coated must be free of oil, grease, dirt, rust, and loose or powdery paint. Comply with the surface preparation requirements specified in Division 09 Section, “Interior Painting”.
   1. Touch-up shop applied prime coats which have been damaged, and bare areas. Wire-brush, solvent clean, and touch-up with the same primer as the shop coat.
   2. Bonding Agent: If required, apply bonding agent to surfaces in accordance with the manufacturer's instructions for the type of substrate and application required.

E. Material Preparation: Carefully mix and prepare materials in accordance with the coating manufacturer's directions.
   1. Stir materials before application to produce a mixture of uniform density, and as required during application. Do not stir surface film into the material. Remove film and strain material before using.
   2. If the manufacturer permits thinning, use only thinners recommended by the manufacturer, and only within recommended limits.

F. Prime substrates where recommended in writing by SFRM manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive SFRM.

G. For exposed applications, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of SFRM. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.
3.3 APPLICATION, GENERAL

A. Comply with fire-resistive material manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and spray on fire-resistive material, as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.

B. Apply SFRM that is identical to products tested as specified in Part 1 "Quality Assurance" Article and substantiated by test reports, with respect to rate of application, accelerator use, sealers, topcoats, tamping, troweling, water overspray, or other materials and procedures affecting test results.

C. Install metal lath and reinforcing fabric, as required, to comply with fire-resistance ratings and fire-resistive material manufacturer's written recommendations for conditions of exposure and intended use. Securely attach lath and fabric to substrate in position required for support and reinforcement of fire-resistive material. Use anchorage devices of type recommended in writing by SFRM manufacturer. Attach accessories where indicated or required for secure attachment of lath and fabric to substrate.

D. Coat substrates with bonding adhesive before applying fire-resistive material where required to achieve fire-resistance rating or as recommended in writing by SFRM manufacturer for material and application indicated.

E. Extend fire-resistive material in full thickness over entire area of each substrate to be protected. Unless otherwise recommended in writing by SFRM manufacturer, install body of fire-resistive covering in a single course.

F. Spray apply fire-resistive materials to maximum extent possible, unless indicated otherwise below. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by SFRM manufacturer.

G. For applications over encapsulant materials, including lockdown (post-removal) encapsulants, apply SFRM that differs in color from that of encapsulant over which it is applied.

H. Where sealers are used, apply products that are tinted to differentiate them from SFRM over which they are applied.

3.4 APPLICATION, CONCEALED SFRM

A. Apply concealed SFRM in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if specified in Part 2 "Concealed SFRM" Article.

B. Apply water overspray to concealed sprayed-fiber fire-resistive material as required to obtain designated fire-resistance rating.

C. Cure concealed SFRM according to product manufacturer's written recommendations.

D. Apply sealer to concealed SFRM where required.

E. Apply topcoat to concealed SFRM where indicated.

3.5 APPLICATION, EXPOSED SFRM

A. Apply exposed SFRM in thicknesses and densities not less than those required to achieve fire-resistance ratings designated for each condition, but apply in greater thicknesses and densities if indicated.
1. For steel beams and bracing, provide a thickness of not less than 1 inch.
2. For metal floor or roof decks, provide a thickness of not less than 1/2 inch.

B. Provide a uniform finish complying with description indicated for each type of material and matching Architect's sample or, if none, finish approved for field-erected mockup.

C. Apply exposed cementitious SFRM to produce the following finish:
   1. Skip-troweled finish with leveled surface, smoothed-out texture, and neat edges.

D. Cure exposed SFRM according to product manufacturer's written recommendations.

E. Apply tinted topcoat to SFRM where indicated for a painted finish.

3.6 FIELD QUALITY CONTROL

A. Retain first option in paragraph below if Owner engages special inspector. If authorities having jurisdiction permit Contractor to engage special inspector, retain second option and retain option for submitting special inspection reports in "Submittals" Article.

B. Retain first option in first paragraph below if Owner engages testing agency. If authorities having jurisdiction permit Contractor to engage testing agency, retain second option and retain option for submitting field quality-control reports in "Submittals" Article.

C. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections and prepare test reports.
   1. Testing and inspecting agency will interpret tests and state in each report whether tested work complies with or deviates from requirements.

D. Tests and Inspections: Testing and inspecting of completed applications of SFRM shall take place in successive stages, in areas of extent and using methods as follows. Do not proceed with application of SFRM for the next area until test results for previously completed applications of SFRM show compliance with requirements. Tested values must equal or exceed values indicated and required for approved fire-resistance design.
   1. Thickness for Floor, Roof, and Wall Assemblies: For each 1000-sq. ft. area, or partial area, on each floor, from the average of 4 measurements from a 144-sq. in. sample area, with sample width of not less than 6 inches per ASTM E 605.
   2. Thickness for Structural Frame Members: From a sample of 25 percent of structural members per floor, taking 9 measurements at a single cross section for structural frame beams or girders, 7 measurements of a single cross section for joists and trusses, and 12 measurements of a single cross section for columns per ASTM E 605.
   3. Density for Floors, Roofs, Walls, and Structural Frame Members: At frequency and from sample size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 605 or AWCI Technical Manual 12-A, Section 5.4.5, "Displacement Method."
   4. Bond Strength for Floors, Roofs, Walls, and Structural Framing Members: For each 10,000-sq. ft. area, or partial area, on each floor, cohesion and adhesion from one sample of size indicated for determining thickness of each type of construction and structural framing member, per ASTM E 736.
      a. Field test SFRM that is applied to flanges of wide-flange, structural-steel members on surfaces matching those that will exist for remainder of steel receiving fire-resistive material.
      b. If surfaces of structural steel receiving SFRM are primed or otherwise painted for coating materials, perform series of bond tests specified in UL's "Fire Resistance Directory." Provide bond strength indicated in referenced UL fire-resistance criteria, but not less than 150 lbf/sq. ft. minimum per ASTM E 736.
5. If testing finds applications of SFRM are not in compliance with requirements, testing and inspecting agency will perform additional random testing to determine extent of noncompliance.

E. Remove and replace applications of SFRM that do not pass tests and inspections for cohesion and adhesion, for density, or for both and retest as specified above.

F. Apply additional SFRM, per manufacturer's written instructions, where test results indicate that thickness does not comply with specified requirements, and retest as specified above.

3.7 CLEANING, PROTECTING, AND REPAIRING

A. Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.

B. Protect fireproofing, according to advice of manufacturer and Installer, from damage resulting from construction operations or other causes, so fireproofing will be without damage or deterioration at time of Substantial Completion.

C. Coordinate application of SFRM with other construction to minimize need to cut or remove fire protection. As installation of other construction proceeds, inspect fireproofing and repair damaged areas and fireproofing removed due to work of other trades.

D. Repair fireproofing damaged by other work before concealing it with other construction.

E. Repair fireproofing by reapplying it using same method as original installation or using manufacturer's recommended trowel-applied product.

3.8 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 81 00
SECTION 07 84 13 - PENETRATION FIRESTOPPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Penetrations in fire-resistance-rated walls.
   2. Penetrations in horizontal assemblies.

B. Related Sections:
   1. Division 07 Section "Fire-Resistive Joint Systems" for joints in or between fire-resistance-rated construction, at exterior curtain-wall/floor intersections, and in smoke barriers.
   2. Division 21 Sections for firestopping requirements associated with HVAC construction.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. LEED Submittals:
   1. Product Data for Credit IEQ 4.1: For penetration firestopping sealants and sealant primers, documentation including printed statement of VOC content.

C. Product Schedule: For each penetration firestopping system. Include location and design designation of qualified testing and inspecting agency.
   1. Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular penetration firestopping condition, submit illustration, with modifications marked, approved by penetration firestopping manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Installer Certificates: From Installer indicating penetration firestopping has been installed in compliance with requirements and manufacturer's written recommendations.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for penetration firestopping.
1.5 QUALITY ASSURANCE

A. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991, "Approval of Firestop Contractors," or been evaluated by UL and found to comply with its "Qualified Firestop Contractor Program Requirements."

B. Fire-Test-Response Characteristics: Penetration firestopping shall comply with the following requirements:

1. Penetration firestopping tests are performed by a qualified testing agency acceptable to authorities having jurisdiction.
2. Penetration firestopping is identical to those tested per testing standard referenced in “Penetration Firestopping” Article. Provide rated systems complying with the following requirements:
   a. Penetration firestopping products bear classification marking of qualified testing and inspecting agency.
   b. Classification markings on penetration firestopping correspond to designations listed by agencies acceptable to authorities having jurisdiction.

C. Preinstallation Conference: Conduct conference at Project site.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not install penetration firestopping when ambient or substrate temperatures are outside limits permitted by penetration firestopping manufacturers or when substrates are wet because of rain, frost, condensation, or other causes.

B. Install and cure penetration firestopping per manufacturer's written instructions using natural means of ventilations or, where this is inadequate, forced-air circulation.

1.7 COORDINATION

A. Coordinate construction of openings and penetrating items to ensure that penetration firestopping is installed according to specified requirements.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate penetration firestopping.

C. Notify Owner's testing agency at least seven days in advance of penetration firestopping installations; confirm dates and times on day preceding each series of installations.

D. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until each installation has been examined by Owner’s inspecting agency and building inspector, if required by authorities having jurisdiction.
PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

2. Grace Construction Products.
3. Hilti, Inc.
5. NUCO Inc.
6. RectorSeal Corporation.
7. Specified Technologies Inc.
8. 3M Fire Protection Products.
10. USG Corporation.

2.2 PENETRATION FIRESTOPPING

A. Provide penetration firestopping that is produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated. Penetration firestopping systems shall be compatible with one another, with the substrates forming openings, and with penetrating items if any.

B. Penetrations in Fire-Resistance-Rated Walls: Provide penetration firestopping with ratings determined per ASTM E 814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg (2.49 Pa).

1. Fire-resistance-rated walls include fire walls fire-barrier walls smoke-barrier walls and fire partitions.
2. F-Rating: Not less than the fire-resistance rating of constructions penetrated.

C. Penetrations in Horizontal Assemblies: Provide penetration firestopping with ratings determined per ASTM E 814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg (2.49 Pa).

1. Horizontal assemblies include floors floor/ceiling assemblies and ceiling membranes of roof/ceiling assemblies.
2. F-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated.
3. T-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated except for floor penetrations within the cavity of a wall.

D. Exposed Penetration Firestopping: Provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E 84.

E. VOC Content: Penetration firestopping sealants and sealant primers shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1. Sealants: 250 g/L.
2. Sealant Primers for Nonporous Substrates: 250 g/L.
3. Sealant Primers for Porous Substrates: 775 g/L.

F. Accessories: Provide components for each penetration firestopping system that are needed to install fill materials and to maintain ratings required. Use only those components specified by penetration firestopping manufacturer and approved by qualified testing and inspecting agency for firestopping indicated.

1. Permanent forming/damming/backing materials, including the following:
   a. Slag-wool-fiber or rock-wool-fiber insulation.
   b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
   c. Fire-rated form board.
   d. Fillers for sealants.

2. Temporary forming materials.
5. Steel sleeves.

2.3 FILL MATERIALS

A. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.

B. Latex Sealants: Single-component latex formulations that do not re-emulsify after cure during exposure to moisture.

C. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.

D. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized-steel sheet.

E. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.

F. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.

G. Mortars: Prepackaged dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.

H. Pillows/Bags: Reusable heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents, and fire-retardant additives. Where exposed, cover openings with steel-reinforcing wire mesh to protect pillows/bags from being easily removed.

I. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.
J. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:

1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces, and nonsag formulation for openings in vertical and sloped surfaces, unless indicated firestopping limits use of nonsag grade for both opening conditions.

2.4 MIXING

A. For those products requiring mixing before application, comply with penetration firestopping manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning: Clean out openings immediately before installing penetration firestopping to comply with manufacturer's written instructions and with the following requirements:

1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of penetration firestopping.
2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with penetration firestopping. Remove loose particles remaining from cleaning operation.
3. Remove laitance and form-release agents from concrete.

B. Priming: Prime substrates where recommended in writing by manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Masking Tape: Use masking tape to prevent penetration firestopping from contacting adjoining surfaces that will remain exposed on completion of the Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove stains. Remove tape as soon as possible without disturbing firestopping's seal with substrates.

3.3 INSTALLATION

A. General: Install penetration firestopping to comply with manufacturer's written installation instructions and published drawings for products and applications indicated.
B. Install forming materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestopping.

C. Install fill materials for fire stopping by proven techniques to produce the following results:

1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.
2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
3. For fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 IDENTIFICATION

A. Identify penetration firestopping with preprinted metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches (150 mm) of firestopping edge so labels will be visible to anyone seeking to remove penetrating items or firestopping. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:

1. The words "Warning - Penetration Firestopping - Do Not Disturb. Notify Building Management of Any Damage."
2. Contractor's name, address, and phone number.
3. Designation of applicable testing and inspecting agency.
4. Date of installation.
5. Manufacturer's name.
6. Installer's name.

3.5 FIELD QUALITY CONTROL

A. Owner will engage a qualified testing agency to perform tests and inspections.

B. Where deficiencies are found or penetration firestopping is damaged or removed because of testing, repair or replace penetration firestopping to comply with requirements.

C. Proceed with enclosing penetration firestopping with other construction only after inspection reports are issued and installations comply with requirements.

3.6 CLEANING AND PROTECTION

A. Clean off excess fill materials adjacent to openings as the Work progresses by methods and with cleaning materials that are approved in writing by penetration firestopping manufacturers and that do not damage materials in which openings occur.

B. Provide final protection and maintain conditions during and after installation that ensure that penetration firestopping is without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, immediately cut out and remove
damaged or deteriorated penetration firestopping and install new materials to produce systems complying with specified requirements.

3.7 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 84 13
SECTION 07 84 46 - FIRE-RESISTIVE JOINT SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Joints in or between fire-resistance-rated constructions.
      2. Joints at exterior curtain-wall/floor intersections.
   B. Related Sections:
      1. Division 07 Section "Penetration Firestopping" for penetrations in fire-resistance-rated walls, horizontal assemblies, and smoke barriers.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product indicated.
   B. LEED Submittals:
      1. Product Data for Credit IEQ 4.1: For fire-resistive joint system sealants, documentation including printed statement of VOC content.
   C. Product Schedule: For each fire-resistive joint system. Include location and design designation of qualified testing agency.
      1. Where Project conditions require modification to a qualified testing agency's illustration for a particular fire-resistive joint system condition, submit illustration, with modifications marked, approved by fire-resistive joint system manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.

1.4 INFORMATIONAL SUBMITTALS
   A. Qualification Data: For qualified Installer.
   B. Installer Certificates: From Installer indicating fire-resistive joint systems have been installed in compliance with requirements and manufacturer's written recommendations.
   C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for fire-resistive joint systems.

1.5 QUALITY ASSURANCE
   A. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991, "Approval of Firestop Contractors," or been evaluated by UL and found to comply with UL's "Qualified Firestop Contractor Program Requirements."
   B. Fire-Test-Response Characteristics: Fire-resistive joint systems shall comply with the following requirements:
      1. Fire-resistive joint system tests are performed by a qualified testing agency acceptable to authorities having jurisdiction.
2. Fire-resistive joint systems are identical to those tested per testing standard referenced in "Fire-Resistive Joint Systems" Article. Provide rated systems complying with the following requirements:
   a. Fire-resistive joint system products bear classification marking of qualified testing agency.
   b. Fire-resistive joint systems correspond to those indicated by reference to designations listed by the following:
      1) UL in its "Fire Resistance Directory."

C. Preinstallation Conference: Conduct conference at Project site.

1.6 Project Conditions

A. Environmental Limitations: Do not install fire-resistive joint systems when ambient or substrate temperatures are outside limits permitted by fire-resistive joint system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Install and cure fire-resistive joint systems per manufacturer's written instructions using natural means of ventilation or, where this is inadequate, forced-air circulation.

1.7 Coordination

A. Coordinate construction of joints to ensure that fire-resistive joint systems are installed according to specified requirements.

B. Coordinate sizing of joints to accommodate fire-resistive joint systems.

C. Notify Owner's testing agency at least seven days in advance of fire-resistive joint system installations; confirm dates and times on day preceding each series of installations.

PART 2 - PRODUCTS

2.1 Fire-Resistive Joint Systems

A. Where required, provide fire-resistive joint systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assemblies in or between which fire-resistive joint systems are installed. Fire-resistive joint systems shall accommodate building movements without impairing their ability to resist the passage of fire and hot gases.

B. Joints in or between Fire-Resistance-Rated Construction: Provide fire-resistive joint systems with ratings determined per ASTM E 1966 or UL 2079:
   1. Joints include those installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies.
   2. Fire-Resistance Rating: Equal to or exceeding the fire-resistance rating of construction they will join.
   3. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      b. CEMCO.
      c. Fire Trak Corp.
      d. Grace Construction Products.
      e. Hilti, Inc.
      f. Johns Manville.
      g. Nelson Firestop Products.
      h. NUCO Inc.
j. RectorSeal Corporation.
k. Specified Technologies Inc.
l. 3M Fire Protection Products.
n. USG Corporation.

C. Joints at Exterior Curtain-Wall/Floor Intersections: Provide fire-resistant joint systems with rating determined by ASTM E 119 based on testing at a positive pressure differential of 0.01-inch wg (2.49 Pa) or ASTM E 2307.
   1. Fire-Resistance Rating: Equal to or exceeding the fire-resistance rating of the floor assembly.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Grace Construction Products.
      c. Hilti, Inc.
      d. Johns Manville.
      e. Nelson Firestop Products.
      f. NUCO Inc.
      g. Passive Fire Protection Partners.
      h. RectorSeal Corporation.
      i. Specified Technologies Inc.
      j. 3M Fire Protection Products.
      k. Thermafiber, Inc.
      m. USG Corporation.

D. Exposed Fire-Resistive Joint Systems: Provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E 84.

E. VOC Content: Fire-resistive joint system sealants shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
   1. Architectural Sealants: 250 g/L.
   2. Sealant Primers for Nonporous Substrates: 250 g/L.
   3. Sealant Primers for Porous Substrates: 775 g/L.

F. Accessories: Provide components of fire-resistant joint systems, including primers and forming materials, that are needed to install fill materials and to maintain ratings required. Use only components specified by fire-resistant joint system manufacturer and approved by the qualified testing agency for systems indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for joint configurations, substrates, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning: Clean joints immediately before installing fire-resistant joint systems to comply with fire-resistant joint system manufacturer's written instructions and the following requirements:
1. Remove from surfaces of joint substrates foreign materials that could interfere with adhesion of fill materials.
2. Clean joint substrates to produce clean, sound surfaces capable of developing optimum bond with fill materials. Remove loose particles remaining from cleaning operation.
3. Remove laitance and form-release agents from concrete.

B. Priming: Prime substrates where recommended in writing by fire-resistive joint system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Masking Tape: Use masking tape to prevent fill materials of fire-resistive joint system from contacting adjoining surfaces that will remain exposed on completion of the Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove stains. Remove tape as soon as possible without disturbing fire-resistive joint system's seal with substrates.

3.3 INSTALLATION

A. General: Install fire-resistive joint systems to comply with manufacturer's written installation instructions and published drawings for products and applications indicated.

B. Install forming materials and other accessories of types required to support fill materials during their application and in position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
   1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of fire-resistive joint system.

C. Install fill materials for fire-resistive joint systems by proven techniques to produce the following results:
   1. Fill voids and cavities formed by joints and forming materials as required to achieve fire-resistance ratings indicated.
   2. Apply fill materials so they contact and adhere to substrates formed by joints.
   3. For fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 IDENTIFICATION

A. Identify fire-resistive joint systems with preprinted metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches (150 mm) of joint edge so labels will be visible to anyone seeking to remove or penetrate joint system. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:
   2. Contractor's name, address, and phone number.
   3. Designation of applicable testing agency.
   4. Date of installation.
   5. Manufacturer's name.
   6. Installer's name.

3.5 FIELD QUALITY CONTROL

A. Inspecting Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Where deficiencies are found or fire-resistive joint systems are damaged or removed due to testing, repair or replace fire-resistive joint systems so they comply with requirements.
C. Proceed with enclosing fire-resistive joint systems with other construction only after inspection reports are issued and installations comply with requirements.

3.6 CLEANING AND PROTECTING

A. Clean off excess fill materials adjacent to joints as the Work progresses by methods and with cleaning materials that are approved in writing by fire-resistive joint system manufacturers and that do not damage materials in which joints occur.

B. Provide final protection and maintain conditions during and after installation that ensure fire-resistive joint systems are without damage or deterioration at time of Substantial Completion. If damage or deterioration occurs despite such protection, cut out and remove damaged or deteriorated fire-resistive joint systems immediately and install new materials to produce fire-resistive joint systems complying with specified requirements.

3.7 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 84 46
SECTION 07 92 00 - JOINT SEALANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions
and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Silicone joint sealants.
   2. Urethane joint sealants.
   3. Latex joint sealants.
   4. Preformed joint sealants.
   5. Acoustical sealants.

B. Related Sections: Sealant work related to the work specified in the following Sections is work of the
following Sections but shall also comply with the requirements of this Section. The additional
requirements specified under this section include, but are not limited to, pre-construction
compatibility and adhesion testing and installation with work specified in the following Sections:
   1. Division 04 Section "Unit Masonry" for masonry control and expansion joint fillers and
gaskets.
   2. Division 07 Section "Fire-Resistant Joint Systems" for sealing joints in fire-resistance-rated
construction.
   3. Division 07 Section “Fluid Applied Air and Vapor Barrier” for sealant joints within and between
the air and vapor barrier system and adjacent construction.
   4. Division 07 Section “EPDM Roofing” for sealant joints integrated within roofing system.
   5. Division 07 Section “Garden Roof” for sealant joints integrated within roofing system.
   6. Division 08 Section "Glazed Aluminum Curtain Walls" for structural and other glazing
sealants.
   7. Division 08 Section "Glazing" for glazing sealants.
   8. Division 09 Section "Gypsum Board" for sealing perimeter joints and acoustical sealant when
associated with gwb partitions, ceilings, etc.
   9. Division 09 Section "Tiling" for sealing tile joints.
  10. Division 09 Section "Acoustical Panel Ceilings" for sealing edge moldings at perimeters with
acoustical sealant.

1.3 PRECONSTRUCTION TESTING

A. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for
testing indicated below, samples of materials that will contact or affect joint sealants.
   1. Use ASTM C 1087 to determine whether priming and other specific joint preparation
techniques are required to obtain rapid, optimum adhesion of joint sealants to joint
substrates.
   2. Submit not fewer than eight pieces of each kind of material, including joint substrates, shims,
joint-sealant backings, secondary seals, and miscellaneous materials.
   3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   4. For materials failing tests, obtain joint-sealant manufacturer's written instructions for
corrective measures including use of specially formulated primers.
   5. Testing will not be required if joint-sealant manufacturers submit joint preparation data that
are based on previous testing, not older than 24 months, of sealant products for adhesion to,
and compatibility with, joint substrates and other materials matching those submitted.
B. Preconstruction Field-Adhesion Testing: Before installing sealants, field test their adhesion to Project joint substrates as follows:
1. Locate test joints where indicated on Project or, if not indicated, as directed by Architect.
2. Conduct field tests for each application indicated below:
   a. Each kind of sealant and joint substrate indicated.
3. Notify Architect seven days in advance of dates and times when test joints will be erected.
4. Arrange for tests to take place with joint-sealant manufacturer's technical representative present.
      1) For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
5. Report whether sealant failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. For sealants that fail adhesively, retest until satisfactory adhesion is obtained.
6. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.

1.4 ACTION SUBMITTALS

A. Product Data: For each joint-sealant product indicated.

B. LEED Submittals:
   1. Product Data for Credit IEQ 4.1: For sealants and sealant primers used inside the weatherproofing system, documentation including printed statement of VOC content.

C. Samples for Initial Selection: Manufacturer's color charts consisting of strips of cured sealants showing the full range of colors available for each product exposed to view.

D. Samples for Verification: For each kind and color of joint sealant required, provide Samples with joint sealants in 1/2-inch- (13-mm-) wide joints formed between two 6-inch- (150-mm-) long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.

E. Joint-Sealant Schedule: Include the following information:
   1. Joint-sealant application, joint location, and designation.
   2. Joint-sealant manufacturer and product name.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Product Certificates: For each kind of joint sealant and accessory, from manufacturer.

C. Sealant, Waterproofing, and Restoration Institute (SWRI) Validation Certificate: For each sealant specified to be validated by SWRI's Sealant Validation Program.

D. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating that sealants comply with requirements.

E. Preconstruction Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
1. Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.

F. Preconstruction Field-Adhesion Test Reports: Indicate which sealants and joint preparation methods resulted in optimum adhesion to joint substrates based on testing specified in "Preconstruction Testing" Article.

G. Field-Adhesion Test Reports: For each sealant application tested.

H. Warranties: Sample of special warranties.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Source Limitations: Obtain each kind of joint sealant from single source from single manufacturer.

C. Product Testing: Test joint sealants using a qualified testing agency.
1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C 1021 to conduct the testing indicated.
2. Test according to SWRI's Sealant Validation Program for compliance with requirements specified by reference to ASTM C 920 for adhesion and cohesion under cyclic movement, adhesion-in-peel, and indentation hardness.

D. Mockups: Install sealant in mockups of assemblies specified in other Sections that are indicated to receive joint sealants specified in this Section. Use materials and installation methods specified in this Section.

E. Preinstallation Conference: Conduct conference at Project site.

1.7 PROJECT CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:
1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 40 deg F (5 deg C).
2. When joint substrates are wet.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

1.8 WARRANTY

A. Special Installer's Warranty: Manufacturer's standard form in which Installer agrees to repair or replace joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.
1. Warranty Period: Two years from date of Substantial Completion.

B. Special Manufacturer's Warranty: Manufacturer's standard form in which joint-sealant manufacturer agrees to furnish joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.
1. Warranty Period: Ten years from date of Substantial Completion.
C. Special warranties specified in this article exclude deterioration or failure of joint sealants from the following:
1. Movement of the structure caused by structural settlement or errors attributable to design or construction resulting in stresses on the sealant exceeding sealant manufacturer's written specifications for sealant elongation and compression.
2. Disintegration of joint substrates from natural causes exceeding design specifications.
3. Mechanical damage caused by individuals, tools, or other outside agents.
4. Changes in sealant appearance caused by accumulation of dirt or other atmospheric contaminants.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.

B. VOC Content of Interior Sealants: Sealants and sealant primers used inside the weatherproofing system shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
1. Architectural Sealants: 250 g/L.
2. Sealant Primers for Nonporous Substrates: 250 g/L.
3. Sealant Primers for Porous Substrates: 775 g/L.

C. Liquid-Applied Joint Sealants: Comply with ASTM C 920 and other requirements indicated for each liquid-applied joint sealant specified, including those referencing ASTM C 920 classifications for type, grade, class, and uses related to exposure and joint substrates.
1. Suitability for Immersion in Liquids. Where sealants are indicated for Use I for joints that will be continuously immersed in liquids, provide products that have undergone testing according to ASTM C 1247. Liquid used for testing sealants is deionized water, unless otherwise indicated.

D. Stain-Test-Response Characteristics: Where sealants are specified to be nonstaining to porous substrates, provide products that have undergone testing according to ASTM C 1248 and have not stained porous joint substrates indicated for Project.

E. Suitability for Contact with Food: Where sealants are indicated for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.

F. Colors of Exposed Joint Sealants: As selected by Architect from manufacturer's full range of standard and premium colors.

2.2 SILICONE JOINT SEALANTS

A. Single-Component, Nonsag, Neutral-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 100/50, for Use NT.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Tremco Incorporated; Spectrem 1.

2.3 URETHANE JOINT SEALANTS

A. Single-Component, Nonsag, Urethane Joint Sealant: ASTM C 920, Type S, Grade NS, Class 100/50, for Use NT.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Sika Corporation, Construction Products Division; Sikaflex - 15LM.
   b. Tremco Incorporated; Dymonic FC.

B. Single-Component, Pourable, Traffic-Grade, Urethane Joint Sealant: ASTM C 920, Type S, Grade P, Class 25, for Use T.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Tremco Incorporated; Vulkem 45.

C. Multipart, Pourable Urethane Sealant for Use T: ASTM C 920; Type M; Grade P; Class 25; Uses T, M, A, and, as applicable to joint substrates indicated, O.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Tremco Incorporated.; THC-900, THC-901 or Vulkem 245.

2.4 LATEX JOINT SEALANTS

A. Latex Joint Sealant: Acrylic latex or siliconized acrylic latex, ASTM C 834, Type OP, Grade NF.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Tremco Incorporated; Tremflex 834.

2.5 PREFORMED JOINT SEALANTS

A. Preformed Foam Joint Sealant: Manufacturer's standard preformed, precompressed, open-cell foam sealant manufactured from urethane foam with minimum density of 10 lb/cu. ft. (160 kg/cu. m) and impregnated with a nondrying, water-repellent agent. Factory produce in precompressed sizes in roll or stick form to fit joint widths indicated; coated on one side with a pressure-sensitive adhesive and covered with protective wrapping.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Dayton Superior Specialty Chemicals; Polytite Standard.
      b. EMSEAL Joint Systems, Ltd.; Emseal 25V.
      c. Sandell Manufacturing Co., Inc.; Polyseal.
      d. Willseal USA, LLC; Willseal 150 or Willseal 250.

2.6 ACOUSTICAL JOINT SEALANTS

A. Acoustical Joint Sealant: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Pecora Corporation; AC-20 FTR.
      b. USG Corporation; SHEETROCK Acoustical Sealant.

2.7 JOINT SEALANT BACKING

A. General: Provide sealant backings of material that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

B. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin), Type O (open-cell material), Type B (bicellular material with a surface skin), or any of the preceding types, as approved in writing by joint-sealant manufacturer for joint application indicated, and of size...
and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

C. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint. Provide self-adhesive tape where applicable.

2.8 MISCELLANEOUS MATERIALS

A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.

C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:

1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

2. Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:
   a. Concrete.
   b. Brick, Stone and CMU Masonry.
   c. Unglazed surfaces of ceramic tile.

3. Remove laitance and form-release agents from concrete.

4. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:
   a. Metal
   b. Primed and/or painted steel
   c. Primed and/or painted aluminum
   d. Fluoropolymer coated aluminum
   e. Zinc coated copper flashing and trim.
f. Glass.
g. Glazed surfaces of ceramic tile.

B. Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated by preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.3 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install sealant backings of kind indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
   1. Do not leave gaps between ends of sealant backings.
   2. Do not stretch, twist, puncture, or tear sealant backings.
   3. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.

D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
   1. Place sealants so they directly contact and fully wet joint substrates.
   2. Completely fill recesses in each joint configuration.
   3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

F. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
   1. Remove excess sealant from surfaces adjacent to joints.
   2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
   3. Provide concave joint profile per Figure 8A in ASTM C 1193, unless otherwise indicated.
   4. Provide flush joint profile where indicated per Figure 8B in ASTM C 1193.
   5. Provide recessed joint configuration of recess depth and at locations indicated per Figure 8C in ASTM C 1193.
      a. Use masking tape to protect surfaces adjacent to recessed tooled joints.

G. Installation of Preformed Foam Sealants: Install each length of sealant immediately after removing protective wrapping. Do not pull or stretch material. Produce seal continuity at ends, turns, and intersections of joints. For applications at low ambient temperatures, apply heat to sealant in compliance with sealant manufacturer's written instructions.
H. Acoustical Sealant Installation: At sound-rated assemblies and elsewhere as indicated, seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C 919 and with manufacturer's written recommendations.

3.4 FIELD QUALITY CONTROL

A. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:
1. Extent of Testing: Test completed and cured sealant joints as follows:
   a. Perform [10] tests for the first 1000 feet (300 m) of joint length for each kind of sealant and joint substrate.
   b. Perform 1 test for each 1000 feet (300 m) of joint length thereafter or 1 test per each floor per elevation.
   a. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
3. Inspect tested joints and report on the following:
   a. Whether sealants filled joint cavities and are free of voids.
   b. Whether sealant dimensions and configurations comply with specified requirements.
   c. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field-adhesion hand-pull test criteria.
4. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.
5. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

B. Evaluation of Field-Adhesion Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

3.5 CLEANING

A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.6 PROTECTION

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

3.7 JOINT-SEALANT SCHEDULE

A. Joint-Sealant Application: Exterior joints in horizontal traffic surfaces.
1. Joint Locations:
   a. Control and expansion joints in stone and flooring, including steps.
b. Isolation and contraction joints in cast-in-place concrete slabs.
c. Tile control and expansion joints.
d. Joints between different materials listed above.
e. Other joints as indicated.

3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

   1. Joint Locations:
      b. Control and expansion joints in unit masonry.
      c. Joints in dimension stone cladding.
      d. Joints between metal panels.
      e. Joints between different materials listed above.
      f. Zinc-faced copper flashing and trim.
      g. Perimeter joints between materials listed above and frames of doors, windows and louvers.
      h. Control and expansion joints in ceilings and other overhead surfaces.
      i. Other joints as indicated.
   2. Silicone Joint Sealant: Single component, nonsag, neutral curing, Class 100/50.

C. Joint-Sealant Application: Interior joints in horizontal traffic surfaces.
   1. Joint Locations:
      b. Control and expansion joints in stone flooring.
      c. Control and expansion joints in tile flooring.
      d. Other joints as indicated.
   2. Urethane Joint Sealant: Multi component, pourable, traffic grade.

   1. Joint Locations:
      a. Control and expansion joints on exposed interior surfaces of exterior walls.
      b. Perimeter joints of exterior openings where indicated.
      c. Tile control and expansion joints.
      d. Vertical joints on exposed surfaces of interior unit masonry, concrete walls and partitions.
      e. Perimeter joints between interior wall surfaces and frames of interior doors, windows and elevator entrances.
      f. Other joints as indicated.
   3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

E. Joint-Sealant Application: Interior acoustical joints in vertical surfaces and horizontal nontraffic surfaces.
   1. Joint Location:
      a. Acoustical joints where indicated.
      b. Other joints as indicated.
   3. Joint-Sealant Color: As selected by Architect from manufacturer's full range of colors.

3.8 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 07 92 00
SECTION 08 11 13 - HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Standard hollow metal doors and frames.

B. Related Sections:
   1. Division 04 Section "Unit Masonry" for embedding anchors for hollow metal work into masonry construction.
   2. Division 08 Section "Door Hardware" for door hardware for hollow metal doors.
   3. Division 09 Section "Painting" for field painting hollow metal doors and frames.
   4. Division 26 Sections for electrical connections including conduit and wiring for door controls and operators.

1.3 DEFINITIONS

A. Minimum Thickness: Minimum thickness of base metal without coatings.

B. Standard Hollow Metal Work: Hollow metal work fabricated according to ANSI/SDI A250.8.

C. Custom Hollow Metal Work: Hollow metal work fabricated according to ANSI/NAAMM-HMMA 861.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, core descriptions, fire-resistance rating, and finishes.

B. Shop Drawings: Include the following:
   1. Elevations of each door design.
   2. Details of doors, including vertical and horizontal edge details and metal thicknesses.
   3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
   4. Locations of reinforcement and preparations for hardware.
   5. Details of each different wall opening condition.
   6. Details of anchorages, joints, field splices, and connections.
   7. Details of accessories.
   8. Details of moldings, removable stops, and glazing.
   9. Details of conduit and preparations for power, signal, and control systems.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Samples for Verification:
   1. For each type of exposed finish required, prepared on Samples of not less than 3 by 5 inches (75 by 125 mm).

E. Other Action Submittals:
1. Schedule: Provide a schedule of hollow metal work prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with door hardware schedule.

1.5 INFORMATIONAL SUBMITTALS
A. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each type of hollow metal door and frame assembly.

1.6 QUALITY ASSURANCE
A. Source Limitations: Obtain hollow metal work from single source from single manufacturer.
B. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252.
C. Smoke-Control Door Assemblies: Comply with NFPA 105 or UL 1784.
D. Preinstallation Conference: Conduct conference at Project site.

1.7 DELIVERY, STORAGE, AND HANDLING
A. Deliver hollow metal work palletized, wrapped, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic.
1. Provide additional protection to prevent damage to finish of factory-finished units.
2. Minimize packaging required for material delivery to the extent possible without compromising protection of materials while either in transit to the project site or being stored on site. Refer to Construction Waste Management Plan.
B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.
C. Store hollow metal work under cover at Project site. Place in stacks of five units maximum in a vertical position with heads up, spaced by blocking, on minimum 4-inch- (102-mm-) high wood blocking. Do not store in a manner that traps excess humidity.
1. Provide minimum 1/4-inch (6-mm) space between each stacked door to permit air circulation.

1.8 PROJECT CONDITIONS
A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.9 COORDINATION
A. Coordinate installation of anchorages for hollow metal frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS
A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
2.2 MATERIALS

A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B; suitable for exposed applications.

B. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

C. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum A40 (ZF120) metallic coating.

D. Frame Anchors: ASTM A 591/A 591M, Commercial Steel (CS), 40Z (12G) coating designation; mill phosphatized.
   1. For anchors built into exterior walls, steel sheet complying with ASTM A 1008/A 1008M or ASTM A 1011/A 1011M, hot-dip galvanized according to ASTM A 153/A 153M, Class B.

E. Inserts, Bolts, and Fasteners: Hot-dip galvanized according to ASTM A 153/A 153M.

F. Grout: ASTM C 476, except with a maximum slump of 4 inches (102 mm), as measured according to ASTM C 143/C 143M.

G. Mineral-Fiber Insulation: ASTM C 665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool with 6- to 12-lb/cu. ft. (96- to 192-kg/cu. m) density; with maximum flame-spread and smoke-development indexes of 25 and 50, respectively; passing ASTM E 136 for combustion characteristics.

H. Glazing: Comply with requirements in Division 08 Section "Glazing."

I. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil (0.4-mm) dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.3 STANDARD HOLLOW METAL DOORS

A. General: Provide doors of design indicated, not less than thickness indicated; fabricated with smooth surfaces, without visible joints or seams on exposed faces unless otherwise indicated. Comply with ANSI/SDI A250.8.
   1. Design: Flush panel.
   2. Core Construction: Manufacturer's standard kraft-paper honeycomb, polystyrene, polyurethane, polyisocyanurate, mineral-board, or vertical steel-stiffener core.
      a. Fire Door Core: As required to provide fire-protection ratings indicated.
b. Thermal-Rated (Insulated) Doors: Where indicated, provide doors fabricated with thermal-resistance value (R-value) of not less than 6.0 deg F x h x sq. ft./Btu (1.057 K x sq. m/W) when tested according to ASTM C 1363.
   1) Locations: Exterior doors.
3. Vertical Edges for Single-Acting Doors: Square edge unless beveled edge is indicated.
   a. Beveled Edge: 1/8 inch in 2 inches (3 mm in 50 mm).
4. Vertical Edges for Double-Acting Doors: Round vertical edges with 2-1/8-inch (54-mm) radius.
5. Top and Bottom Edges: Closed with flush or inverted 0.042-inch- (1.0-mm-) thick, end closures or channels of same material as face sheets.

B. Exterior Doors: Face sheets fabricated from metallic-coated steel sheet. Provide doors complying with requirements indicated below by referencing ANSI/SDI A250.8 for level and model and ANSI/SDI A250.4 for physical performance level:
   1. Level 3 and Physical Performance Level A (Extra Heavy Duty), Model 1 (Full Flush).

C. Interior Doors: Face sheets fabricated from cold-rolled steel sheet unless metallic-coated sheet is indicated. Provide doors complying with requirements indicated below by referencing ANSI/SDI A250.8 for level and model and ANSI/SDI A250.4 for physical performance level:
   1. Level 3 and Physical Performance Level A (Extra Heavy Duty), Model 1 (Full Flush).

D. Hardware Reinforcement: Fabricate according to ANSI/SDI A250.6 with reinforcing plates from same material as door face sheets.
E. Fabricate concealed stiffeners and hardware reinforcement from either cold- or hot-rolled steel sheet.

2.4 STANDARD HOLLOW METAL FRAMES

A. General: Comply with ANSI/SDI A250.8 and with details indicated for type and profile.
   1. Fabricate frames with mitered or coped corners.
   2. Fabricate frames as face welded unless otherwise indicated.
   3. Frames for Level 3 Steel Doors: 0.053-inch- (1.3-mm-) thick steel sheet.
C. Interior Frames: Fabricated from cold-rolled steel sheet unless metallic-coated sheet is indicated.
   1. Fabricate frames with mitered or coped corners.
   2. Fabricate frames as face welded unless otherwise indicated.
   3. Fabricate knocked-down, drywall slip-on frames for in-place gypsum board partitions.
   4. Frames for Level 3 Steel Doors: 0.053-inch- (1.3-mm-) thick steel sheet.
   5. Frames for Wood Doors: 0.067-inch- (1.7-mm-) thick steel sheet.
   6. Frames for Borrowed Lights: Same as adjacent door frame.
D. Hardware Reinforcement: Fabricate according to ANSI/SDI A250.6 with reinforcement plates from same material as frames.

2.5 FRAME ANCHORS

A. Jamb Anchors:
   1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, not less than 0.042 inch (1.0 mm) thick, with corrugated or perforated straps not less than 2 inches (50 mm) wide by 10 inches (250 mm) long; or wire anchors not less than 0.177 inch (4.5 mm) thick.
   2. Stud-Wall Type: Designed to engage stud, welded to back of frames; not less than 0.042 inch (1.0 mm) thick.
B. Floor Anchors: Formed from same material as frames, not less than 0.042 inch (1.0 mm) thick, and as follows:
   1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners.
   2. Separate Topping Concrete Slabs: Adjustable-type anchors with extension clips, allowing not less than 2-inch (50-mm) height adjustment. Terminate bottom of frames at finish floor surface.
   3. Access Floor: Comply with all access flooring manufacturer's requirements and recommendations for anchoring construction to and near access flooring.

2.6 HOLLOW METAL PANELS

A. Provide hollow metal panels of same materials, construction, and finish as specified for adjoining hollow metal work.

2.7 STOPS AND MOLDINGS

A. Moldings for Glazed Lites in Doors: Minimum 0.032 inch (0.8 mm) thick, fabricated from same material as door face sheet in which they are installed.

B. Fixed Frame Moldings: Formed integral with hollow metal frames, a minimum of 5/8 inch (16 mm) high unless otherwise indicated.

C. Loose Stops for Glazed Lites in Frames: Minimum 0.032 inch (0.8 mm) thick, fabricated from same material as frames in which they are installed.

2.8 ACCESSORIES

A. Mullions and Transom Bars: Join to adjacent members by welding or rigid mechanical anchors.

B. Ceiling Struts: Minimum 1/4-inch-thick by 1-inch- (6.4-mm-thick by 25.4-mm-) wide steel.

C. Grout Guards: Formed from same material as frames, not less than 0.016 inch (0.4 mm) thick.

2.9 FABRICATION

A. Fabricate hollow metal work to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.

B. Tolerances: Fabricate hollow metal work to tolerances indicated in SDI 117.

C. Hollow Metal Doors:
   1. Exterior Doors: Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
   2. Glazed Lites: Factory cut openings in doors.
   3. Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4 inch (19 mm) beyond edge of door on which astragal is mounted.

D. Hollow Metal Frames: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.
   1. Welded Frames: Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible.
2. Sidelight and Transom Bar Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by butt welding.

3. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.

4. Grout Guards: Weld guards to frame at back of hardware mortises in frames to be grouted.

5. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.

6. Jamb Anchors: Provide number and spacing of anchors as follows:
   a. Masonry Type: Locate anchors not more than 18 inches (457 mm) from top and bottom of frame. Space anchors not more than 32 inches (813 mm) o.c. and as follows:
      1) Two anchors per jamb up to 60 inches (1524 mm) high.
      2) Three anchors per jamb from 60 to 90 inches (1524 to 2286 mm) high.
      3) Four anchors per jamb from 90 to 120 inches (2286 to 3048 mm) high.
      4) Four anchors per jamb plus 1 additional anchor per jamb for each 24 inches (610 mm) or fraction thereof above 120 inches (3048 mm) high.
   b. Stud-Wall Type: Locate anchors not more than 18 inches (457 mm) from top and bottom of frame. Space anchors not more than 32 inches (813 mm) o.c. and as follows:
      1) Three anchors per jamb up to 60 inches (1524 mm) high.
      2) Four anchors per jamb from 60 to 90 inches (1524 to 2286 mm) high.
      3) Five anchors per jamb from 90 to 96 inches (2286 to 2438 mm) high.
      4) Five anchors per jamb plus 1 additional anchor per jamb for each 24 inches (610 mm) or fraction thereof above 96 inches (2438 mm) high.
      5) Two anchors per head for frames above 42 inches (1066 mm) wide and mounted in metal-stud partitions.
   c. Compression Type: Not less than two anchors in each jamb.
   d. Postinstalled Expansion Type: Locate anchors not more than 6 inches (152 mm) from top and bottom of frame. Space anchors not more than 26 inches (660 mm) o.c.

7. Door Silencers: Except on weather-stripped doors, drill stops to receive door silencers as follows. Keep holes clear during construction.
   a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
   b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.

E. Fabricate concealed stiffeners, edge channels, and hardware reinforcement from either cold- or hot-rolled steel sheet.

F. Hardware Preparation: Factory prepare hollow metal work to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping according to the Door Hardware Schedule and templates furnished as specified in Division 08 Section "Door Hardware."
   1. Locate hardware as indicated, or if not indicated, according to ANSI/SDI A250.8.
   2. Reinforce doors and frames to receive nontemplated, mortised and surface-mounted door hardware.
   3. Comply with applicable requirements in ANSI/SDI A250.6 and ANSI/DHI A115 Series specifications for preparation of hollow metal work for hardware.
   4. Coordinate locations of conduit and wiring boxes for electrical connections with Division 26 Sections.

G. Stops and Moldings: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints.
   1. Single Glazed Lites: Provide fixed stops and moldings welded on secure side of hollow metal work.
   2. Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite is capable of being removed independently.
   3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.
   4. Provide loose stops and moldings on inside of hollow metal work.
5. Coordinate rabbet width between fixed and removable stops with type of glazing and type of installation indicated.

2.10 STEEL FINISHES

A. Prime Finish: Apply manufacturer's standard primer immediately after cleaning and pretreating.
   1. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with ANSI/SDI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for embedded and built-in anchors to verify actual locations before frame installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove welded-in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.

B. Prior to installation, adjust and securely brace welded hollow metal frames for squareness, alignment, twist, and plumbness to the following tolerances:
   1. Squareness: Plus or minus 1/16 inch (1.6 mm), measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
   2. Alignment: Plus or minus 1/16 inch (1.6 mm), measured at jambs on a horizontal line parallel to plane of wall.
   3. Twist: Plus or minus 1/16 inch (1.6 mm), measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
   4. Plumbness: Plus or minus 1/16 inch (1.6 mm), measured at jambs on a perpendicular line from head to floor.

C. Drill and tap doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.

3.3 INSTALLATION

A. General: Install hollow metal work plumb, rigid, properly aligned, and securely fastened in place; comply with Drawings and manufacturer's written instructions.

B. Hollow Metal Frames: Install hollow metal frames of size and profile indicated. Comply with ANSI/SDI A250.11.
   1. Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.
      a. At fire-protection-rated openings, install frames according to NFPA 80.
b. Where frames are fabricated in sections because of shipping or handling limitations, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.

c. Install frames with removable glazing stops located on secure side of opening.

d. Install door silencers in frames before grouting.

e. Remove temporary braces necessary for installation only after frames have been properly set and secured.

f. Check plumbness, squareness, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.

g. Field apply bituminous coating to backs of frames that are filled with grout containing antifreezing agents.

2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with postinstalled expansion anchors.

a. Floor anchors may be set with powder-actuated fasteners instead of postinstalled expansion anchors if so indicated and approved on Shop Drawings.

4. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with grout.

5. Concrete Walls: Solidly fill space between frames and concrete with grout. Take precautions, including bracing frames, to ensure that frames are not deformed or damaged by grout forces.

6. In-Place Concrete or Masonry Construction: Secure frames in place with postinstalled expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.

7. Ceiling Struts: Extend struts vertically from top of frame at each jamb to overhead structural supports or substrates above frame unless frame is anchored to masonry or to other structural support at each jamb. Bend top of struts to provide flush contact for securing to supporting construction. Provide adjustable wedged or bolted anchorage to frame jamb members.

8. Installation Tolerances: Adjust hollow metal door frames for squareness, alignment, twist, and plumb to the following tolerances:

   a. Squareness: Plus or minus 1/16 inch (1.6 mm), measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
   
   b. Alignment: Plus or minus 1/16 inch (1.6 mm), measured at jambs on a horizontal line parallel to plane of wall.
   
   c. Twist: Plus or minus 1/16 inch (1.6 mm), measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
   
   d. Plumbness: Plus or minus 1/16 inch (1.6 mm), measured at jambs at floor.

C. Hollow Metal Doors: Fit hollow metal doors accurately in frames, within clearances specified below. Shim as necessary.

1. Non-Fire-Rated Standard Steel Doors:

   a. Jambs and Head: 1/8 inch (3 mm) plus or minus 1/16 inch (1.6 mm).
   
   b. Between Edges of Pairs of Doors: 1/8 inch (3 mm) plus or minus 1/16 inch (1.6 mm).
   
   c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch (9.5 mm).
   
   d. Between Bottom of Door and Top of Finish Floor (No Threshold): Maximum 3/4 inch (19 mm).

2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.

D. Glazing: Comply with installation requirements in Division 08 Section "Glazing" and with hollow metal manufacturer's written instructions.

1. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches (230 mm) o.c. and not more than 2 inches (50 mm) o.c. from each corner.
3.4 ADJUSTING AND CLEANING

A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including hollow metal work that is warped, bowed, or otherwise unacceptable.

B. Remove grout and other bonding material from hollow metal work immediately after installation.

C. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying, rust-inhibitive primer.

D. Metallic-Coated Surfaces: Clean abraded areas and repair with galvanizing repair paint according to manufacturer’s written instructions.

3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

END OF SECTION 08 11 13
SECTION 08 12 16 – INTERIOR ALUMINUM FRAMES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes interior aluminum frames for doors and glazing installed in gypsum board partitions.

B. Related Sections:
   1. Division 08 Section "Flush Wood Doors" for wood doors installed in interior aluminum frames.
   2. Division 08 Section "Stile and Rail Wood Doors" for wood doors installed in interior aluminum frames.
   3. Division 26 Sections for electrical connections including conduit and wiring for door controls and operators.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, fire-resistance rating, and finishes.

B. Shop Drawings: Include the following:
   1. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
   2. Locations of reinforcements and preparations for hardware.
   3. Details of each different wall-opening condition.
   4. Details of anchorages, joints, field splices, and connections.
   5. Details of accessories.
   6. Details of moldings, removable stops, and glazing.
   7. Details of conduits and preparations for power, signal, and control systems.

C. Samples for Initial Selection: For units with factory-applied finishes.
   1. Include similar Samples of seals, gaskets, and accessories involving color selection.

D. Samples for Verification: For interior aluminum frames, prepared on Samples of size indicated below:
   1. Framing Member: 12 inches (300 mm) long.
   2. Corner Fabrication: 12-by-12-inch- (300-by-300-mm-) long, full-size window corner, including full-size sections of extrusions with factory-applied color finish.

E. Schedule: For interior aluminum frames. Use same designations indicated on Drawings. Coordinate with door hardware schedule and glazing.

1.4 INFORMATIONAL SUBMITTALS

A. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each type of interior aluminum frame.
1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For interior aluminum frames to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain interior aluminum frames from single source from single manufacturer.

B. Installer Qualifications: An experienced installer who has completed systems similar in material, design, and extent to that indicated for Project and whose work has resulted in construction with a record of successful in-service performance.

C. Fire-Rated Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252 or UL 10C.

D. Preinstallation Conference: Conduct conference at Project site.

1.7 WARRANTY

A. Provide manufacturer’s product warranty of one (1) year.

B. Provide paint finish warranty of five (5) years.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver interior aluminum frames palletized, wrapped, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic. Store interior aluminum frames under cover at Project site.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide “Solutions II” Series, 1-1/2” profile, as manufactured by RACO Interior Products, Inc., or comparable product by one of the following:
1. Advanced Architectural Frames.
2. Custom Components Company.
4. Frameworks Manufacturing.
5. Interior Components Inc.
6. Modulex, Inc; Division of Pacific National Group.
7. RACO Interior Products, Inc.
8. Versatrac.
9. Western Integrated Materials, Inc.

2.2 COMPONENTS

A. Aluminum Framing: ASTM B 221 (ASTM B 221M), Alloy 6063-T5 or alloy and temper required to suit structural and finish requirements, not less than 0.062 inch (1.6 mm) thick.

B. Door Frames: Extruded aluminum, reinforced for hinges, strikes, and closers.
1. 90-Minute Fire-Protection Rating: Where indicated, fabricate aluminum frame assemblies with a cold-formed, primed, interior steel liner.

C. Glazing Frames: Extruded aluminum, for glazing thickness indicated.

D. Ceiling Tracks: Extruded aluminum.

E. Trim: Extruded aluminum, not less than 0.062 inch (1.6 mm) thick, with removable snap-in casing trim and glazing stops as indicated without exposed fasteners.
   1. Trim Style and Width: As indicated on Drawings.

2.3 ACCESSORIES

A. Fasteners: Aluminum, nonmagnetic, stainless-steel or other noncorrosive metal fasteners compatible with frames, stops, panels, reinforcement plates, hardware, anchors, and other items being fastened.

B. Door Silencers: Manufacturer's standard continuous mohair, wool pile, or vinyl seals; color to be selected by Architect.

C. Smoke Seals: Intumescent strip or fire-rated gaskets where required; color to be selected by Architect.

D. Glazing Gaskets: Manufacturer's standard extruded or molded plastic, to accommodate glazing thickness indicated; color to be selected by Architect.

E. Glazing: Comply with requirements in Division 08 Section "Glazing."

F. Hardware: Comply with requirements in Division 08 door hardware Sections.

2.4 FABRICATION

A. Provide concealed corner reinforcements and alignment clips for accurately fitted hairline joints at butted or mitered connections.

B. Factory prepare interior aluminum frames to receive templated mortised hardware; include cutouts, reinforcements, mortising, drilling, and tapping, according to the Door Hardware Schedule and templates furnished as specified in Division 08 Section "Door Hardware."
   1. Locate hardware as required by fire-rated label for assembly.

C. Fabricate frames for glazing with removable stops to allow glazing replacement without dismantling frame.
   1. Locate removable stops on the inside of spaces accessed by keyed doors.

D. Fabricate components to allow secure installation without exposed fasteners.

2.5 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
2.6 ALUMINUM FINISHES

A. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry-film thickness of 1.0 mils (0.025 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
   2. Number of Colors: Three.
   3. Both solid and metallic colors will be used.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, and ceilings, with Installer present, for conditions affecting performance of the Work.
B. Verify that wall thickness does not exceed standard tolerances allowed by throat size indicated.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install interior aluminum frames plumb, rigid, properly aligned, and securely fastened in place; comply with manufacturer's written instructions.
B. Set frames accurately in position and plumbed, aligned, and securely anchored to substrates.
   1. At fire-protection-rated openings, install interior aluminum frames according to NFPA 80 and NFPA 105.
C. Install frame components in the longest possible lengths; components up to 9'-6" long must be one piece.
   1. Use concealed installation clips to produce tightly fitted and aligned splices and connections.
   2. Secure clips to extruded main-frame components and not to snap-in or trim members.
   3. Do not leave screws or other fasteners exposed to view when installation is complete.

3.3 CLEANING

A. Clean exposed frame surfaces promptly after installation, using cleaning methods recommended by frame manufacturer and according to AAMA 609 & 610.
B. Touch up marred frame surfaces so touchup is not visible. Remove and replace frames with damaged finish that cannot be satisfactorily repaired.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.
C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
1. Aluminum.
2. Plastic Materials
3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 12 16
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 08 14 16 - FLUSH WOOD DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Solid-core doors with wood-veneer faces.
   2. Factory finishing flush wood doors with transparent finish.

B. Related Sections:
   1. Division 08 Section “Glazing” for glass view panels in flush wood doors.
   2. Division 08 Section “Steel Doors and Frames” for hollow metal frames for flush wood doors where indicated.
   3. Division 08 Section “Interior Aluminum Frames” for door frames to be used with flush wood doors.
   4. Division 08 Section “Door Hardware” for hardware required for flush wood doors.
   5. Division 08 Section “Stile and Rail Wood Doors” for stile and rail wood doors.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of door indicated. Include details of core and edge construction, louvers, and trim for openings. Include factory-finishing specifications.

B. LEED Submittals:
   1. Certificates for Credit MR 7: Chain-of-custody certificates indicating that flush wood doors comply with forest certification requirements. Include documentation that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.
   2. Product Data for Credit IEQ 4.4: For adhesives and composite wood products, documentation indicating that product contains no urea formaldehyde.

C. Shop Drawings: Indicate location, size, and hand of each door; elevation of each kind of door; construction details not covered in Product Data; location and extent of hardware blocking; and other pertinent data.
   1. Indicate dimensions and locations of mortises and holes for hardware.
   2. Indicate dimensions and locations of cutouts.
   3. Indicate requirements for veneer matching.
   4. Indicate doors to be factory finished and finish requirements.
   5. Indicate fire-protection ratings for fire-rated doors.

D. Samples for Initial Selection: For factory-finished doors.

E. Samples for Verification:
   1. Factory finishes applied to actual door face materials, approximately 8 by 10 inches (200 by 250 mm), for each material and finish. For each wood species and transparent finish, provide set of three samples showing typical range of color and grain to be expected in the finished work.
   2. Corner sections of doors, approximately 8 by 10 inches (200 by 250 mm), with door faces and edges representing actual materials to be used.
a. Provide samples for each species of veneer and solid lumber required.
b. Finish veneer-faced door samples with same materials proposed for factory-finished doors.

3. Louver blade and frame sections, 6 inches (150 mm) long, for each material and finish specified.

4. Frames for light openings, 6 inches (150 mm) long, for each material, type, and finish required.

1.4 INFORMATIONAL SUBMITTALS

A. Warranty: Sample of special warranty.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.

B. Source Limitations: Obtain flush wood doors from single manufacturer.

C. Quality Standard: In addition to requirements specified, comply with AWI's "Architectural Woodwork Quality Standards Illustrated."
   1. Provide AWI Quality Certification Labels or an AWI letter of licensing for Project indicating that doors comply with requirements of grades specified.

D. Fire-Rated Wood Doors: Doors complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252.

E. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Comply with requirements of referenced standard and manufacturer's written instructions.

B. Package doors individually in plastic bags or cardboard cartons.

C. Minimize packaging required for door delivery without compromising protection of materials while either in transit to the project site or being stored on site. Refer to Construction Waste Management Plan.

D. Mark each door on top and bottom rail with opening number used on Shop Drawings.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install doors until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace doors that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Warping (bow, cup, or twist) more than 1/4 inch (6.4 mm) in a 42-by-84-inch (1067-by-2134-mm) section.
b. Telegraphing of core construction in face veneers exceeding 0.01 inch in a 3-inch (0.25 mm in a 76.2-mm) span.

2. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Algoma Hardwoods, Inc.
2. Eggers Industries.
3. Graham; an Assa Abloy Group company.
4. Mohawk Flush Doors, Inc.; a Masonite company.
5. Oshkosh Architectural Door Company.

2.2 DOOR CONSTRUCTION, GENERAL

A. Certified Wood: Fabricate doors with all wood products produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

B. Low-Emitting Materials: Fabricate doors with adhesives and composite wood products that do not contain urea formaldehyde.

C. Particleboard-Core Doors:

1. Particleboard: ANSI A208.1, Grade LD-2, made with binder containing no urea-formaldehyde resin.
2. Alternate Particleboard: Straw-based particleboard complying with ANSI A208.1, Grade LD-2 or M-2, except for density.
3. Provide doors with either glued-wood-stave or structural-composite-lumber cores instead of particleboard cores for doors indicated to receive exit devices.

D. Structural-Composite-Lumber-Core Doors:

   a. Screw Withdrawal, Face: 700 lbf (3100 N).
   b. Screw Withdrawal, Edge: 400 lbf (1780 N).

E. Fire-Protection-Rated Doors: Provide core specified or mineral core as needed to provide fire-protection rating indicated.

1. Edge Construction: Provide edge construction with intumescent seals concealed by outer stile. Comply with specified requirements for exposed edges.
2. Pairs: Provide fire-retardant stiles that are listed and labeled for applications indicated without formed-steel edges and astragals. Provide stiles with concealed intumescent seals. Comply with specified requirements for exposed edges.

F. Mineral-Core Doors:

1. Core: Noncombustible mineral product complying with requirements of referenced quality standard and testing and inspecting agency for fire-protection rating indicated.
2. Blocking: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated as needed to eliminate through-bolting hardware.
3. Edge Construction: At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

2.3 VENEERED-FACED DOORS FOR TRANSPARENT FINISH

A. Interior Solid-Core Doors:
1. Grade: Premium, with Grade AA faces.
2. Species: Select cherry.
3. Cut: Plain sliced (flat sliced).
5. Assembly of Veneer Leaves on Door Faces: Balance match.
6. Pair and Set Match: Provide for doors hung in same opening or separated only by mullions.
7. Room Match: Match door faces within each separate room or area of building. Corridor-door faces do not need to match where they are separated by 20 feet (6 m) or more.
8. Transom Match: Continuous match.
10. Core: Particleboard unless noted otherwise.
11. Construction: Five or seven plies. Stiles and rails are bonded to core, then entire unit abrasive planed before veneering.

2.4 LOUVERS AND LIGHT FRAMES

A. Wood Louvers: Door manufacturer's standard solid-wood louvers unless otherwise indicated.
   1. Wood Species: Same species as door faces.

B. Wood Beads for Light Openings in Wood Doors: Provide manufacturer's standard wood beads as follows unless otherwise indicated.
   1. Wood Species: Same species as door faces.
   2. Profile: Flush rectangular beads unless noted otherwise.
   3. At wood-core doors with 20-minute fire-protection ratings, provide wood beads and metal glazing clips approved for such use.

C. Wood-Veneered Beads for Light Openings in Fire-Rated Doors: Manufacturer's standard wood-veneered noncombustible beads matching veneer species of door faces and approved for use in doors of fire-protection rating indicated. Include concealed metal glazing clips where required for opening size and fire-protection rating indicated.

2.5 FABRICATION

A. Factory fit doors to suit frame-opening sizes indicated. Comply with clearance requirements of referenced quality standard for fitting unless otherwise indicated.
   1. Comply with requirements in NFPA 80 for fire-rated doors.

B. Factory machine doors for hardware that is not surface applied. Locate hardware to comply with DHI-WDHS-3. Comply with final hardware schedules, door frame Shop Drawings, DHI A115-W series standards, and hardware templates.
   1. Coordinate with hardware mortises in metal frames to verify dimensions and alignment before factory machining.
   2. Metal Astragals: Factory machine astragals and formed-steel edges for hardware for pairs of fire-rated doors.

C. Openings: Cut and trim openings through doors in factory.
   1. Light Openings: Trim openings with moldings of material and profile indicated.
   2. Glazing: Factory install glazing in doors indicated to be factory finished. Comply with applicable requirements in Division 08 Section “Glazing.”
2.6 FACTORY FINISHING

A. General: Comply with referenced quality standard for factory finishing. Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.
   1. Finish faces, all four edges, edges of cutouts, and mortises. Stains and fillers may be omitted on bottom edges, edges of cutouts, and mortises.

B. Finish doors at factory that are indicated to receive transparent finish.

C. Transparent Finish:
   1. Grade: Premium.
   2. Finish: AWI catalyzed polyurethane system.
   4. Effect: Filled finish.
   5. Sheen: Satin.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine doors and installed door frames before hanging doors.
   1. Verify that frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
   2. Reject doors with defects.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Hardware: For installation, see Division 08 Section "Door Hardware."

B. Installation Instructions: Install doors to comply with manufacturer's written instructions and the referenced quality standard, and as indicated.
   1. Install fire-rated doors in corresponding fire-rated frames according to NFPA 80.

C. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.

D. Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

3.3 ADJUSTING

A. Operation: Rehang or replace doors that do not swing or operate freely.

B. Finished Doors: Replace doors that are damaged or that do not comply with requirements. Doors may be repaired or refinished if work complies with requirements and shows no evidence of repair or refinishing.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

END OF SECTION 08 14 16
SECTION 08 14 33 - STILE AND RAIL WOOD DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Interior stile and rail wood doors.
2. Factory finishing of stile and rail wood doors.
3. Fitting stile and rail wood doors to frames and machining for hardware.

B. Related Sections:
1. Division 06 Section "Interior Architectural Woodwork" for requirements for veneers from the same flitches for both architectural woodwork and stile and rail wood doors.
2. Division 08 Section "Glazing" for glass vision panels in stile and rail doors.
3. Division 08 Section "Aluminum Frames" for door frame assemblies for stile and rail wood doors fabricated from interior aluminum framing systems.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.
1. Include details of construction and glazing.
2. Include factory finishing specifications.

B. LEED Submittals:
1. Certificates for Credit MR 7: Chain-of-custody certificates indicating that wood used for stile and rail wood doors complies with forest certification requirements. Include evidence that manufacturer is certified for chain of custody by an FSC-accredited certification body. Include statement indicating cost for each certified wood product.
2. Product Data for Credit IEQ 4.4: For adhesives and composite wood materials, documentation indicating that products contain no urea formaldehyde.

C. Shop Drawings: For stile and rail wood doors. Indicate location, size, and hand of each door; elevation of each kind of door; construction details not covered in Product Data, including those for stiles, rails, panels, and moldings (sticking); and other pertinent data, including the following:
1. Dimensions of doors for factory fitting.
2. Locations and dimensions of mortises and holes for hardware.
3. Requirements for veneer matching.
4. Doors to be factory finished, and finish requirements.
5. Fire ratings for fire-rated doors.

D. Samples for Initial Selection (Consisting of color charts incorporating actual materials in small sections): For factory-finished doors, provide full range of standard and premium colors and finishes available for stained doors.

E. Samples for Verification: Corner sections of doors, approximately 8 by 10 inches (200 by 250 mm), with door faces and edgings representing typical range of color and grain for each species of veneer and solid lumber required. Finish Sample with same materials proposed for factory-finished doors.
1.4 INFORMATIONAL SUBMITTALS
   A. Product Certificates: For each type of door, from manufacturer.
   B. Warranty: Sample of special warranty.

1.5 QUALITY ASSURANCE
   A. Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.
   B. Source Limitations: Obtain stile and rail wood doors from single manufacturer.
   C. Safety Glass: Provide products complying with testing requirements in 16 CFR 1201, for Category II materials, unless those of Category I are expressly indicated and permitted.

1.6 DELIVERY, STORAGE, AND HANDLING
   A. Comply with manufacturer's written instructions and requirements of quality standard referenced in Part 2.
   B. Package doors individually in opaque plastic bags or cardboard cartons.
   C. Minimize packaging required for door delivery without compromising protection of materials while either in transit to the project site or being stored on site. Refer to Construction Waste Management Plan.
   D. Mark each door on top and bottom edge with opening number used on Shop Drawings.

1.7 PROJECT CONDITIONS
   A. Environmental Limitations: Do not deliver or install doors until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.8 WARRANTY
   A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace doors that fail in materials or workmanship, or have warped (bow, cup, or twist) more than 1/4 inch (6.4 mm) in a 42-by-84-inch (1067-by-2134-mm) section.
      1. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors.
      2. Warranty shall be in effect during the following period of time from date of Substantial Completion:
         a. Interior Doors: Life of installation.

PART 2 - PRODUCTS

2.1 MATERIALS
   A. General: Use only materials that comply with referenced standards and other requirements specified.
1. Assemble interior doors, frames, and sidelites, including components, with either dry-use or wet-use adhesives complying with ASTM D 5572 for finger joints and with ASTM D 5751 for joints other than finger joints.

B. Certified Wood: Fabricate doors with all wood products produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

C. Low-Emitting Materials: Fabricate doors with adhesives and composite wood products that do not contain urea-formaldehyde resins.

2.2 INTERIOR STILE AND RAIL WOOD DOORS

A. Interior Stile and Rail Wood Doors: Custom interior doors complying with AWI's "Architectural Woodwork Quality Standards," and with other requirements specified.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Algoma Hardwoods, Inc.
   b. Eggers Industries.
   c. Enjo Architectural Millwork.
   d. Maiman Company (The).
   e. Pinecrest, Inc.
   f. Select Interior Door, Ltd.
   g. TruStile Doors LLC.
   h. Woodtech Trading Company.

2. Panel Designs: Indicated by Drawings. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

3. Grade: Premium.

5. Wood Species and Cut for Transparent Finish: Select clear cherry, plain sawed/sliced.

6. Door Construction for Transparent Finish:
   a. Stile and Rail Construction: Clear lumber; may be edge glued for width. Select lumber for similarity of grain and color, and arrange for optimum match between adjacent pieces.
   b. Thickness: As scheduled.

7. Stile and Rail Widths: As indicated.

8. Molding Profile (Sticking): Flat bead stop.

9. Glass: As indicated in door schedule, complying with Division 08 Section "Glazing."

10. Provide AWI Quality Certification Labels or an AWI letter of licensing for Project indicating that doors comply with requirements of grades specified.

11. Finishing: Factory finish this door type according to finishing requirements in this Section.

2.3 STILE AND RAIL WOOD DOOR FABRICATION

A. Fabricate stile and rail wood doors in sizes indicated for field fitting.

B. Factory fit doors to suit frame-opening sizes indicated, with the following uniform clearances and bevels unless otherwise indicated:

1. Clearances: Provide 1/8 inch (3 mm) at heads, jambs, and between pairs of doors. Provide 1/2 inch (13 mm) from bottom of door to top of decorative floor finish or covering. Where threshold is shown or scheduled, provide not more than 3/8 inch (10 mm) from bottom of door to top of threshold.
   a. Comply with NFPA 80 for fire-rated doors.

2. Bevel non-fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) at lock and hinge edges.

3. Bevel fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) on lock edge; trim stiles and rails only to extent permitted by labeling agency.
C. Factory machine doors for hardware that is not surface applied. Locate hardware to comply with DHI-WDHS-3. Comply with final hardware schedules, door frame Shop Drawings, DHI A115-W Series standards, and hardware templates.
   1. Coordinate measurements of hardware mortises in metal frames to verify dimensions and alignment before factory machining.

D. Glazed Openings: Trim openings indicated for glazing with solid wood moldings, with one side removable. Miter wood moldings at corner joints.

E. Glazed Openings: Glaze doors at factory with glass of type and thickness indicated, complying with Division 08 Section "Glazing." Install glass using manufacturer's standard elastomeric glazing sealant complying with ASTM C 920. Secure glass in place with removable wood moldings. Miter wood moldings at corner joints.

2.4 FINISHING

A. Finish wood doors at factory.

   1. Finish faces and all four edges of doors, including mortises and cutouts. Stains and fillers may be omitted on top and bottom edges, edges of cutouts, and mortises.

C. Transparent Finish:
   1. Grade: Premium.
   2. Finish: AWI catalyzed polyurethane system.
   4. Effect: Filled finish.
   5. Sheen: Satin.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine doors and substrates, with Installer present, for suitable conditions where wood stile and rail doors and fire-rated wood door frames will be installed.
   1. Verify that installed frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
   2. Reject doors with defects.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install fire-rated wood door frames level, plumb, true, and aligned with adjacent materials. Use concealed shims where necessary for alignment.
   1. Countersink fasteners, fill surface flush, and sand smooth.

B. Hardware: For installation, see Division 08 Section "Door Hardware."

   1. Install fire-rated doors in corresponding fire-rated frames according to NFPA 80.
D. Field-Fitted Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer or permitted with fire-rated doors. Machine doors for hardware. Seal cut surfaces after fitting and machining.
   1. Clearances: Provide 1/8 inch (3 mm) at heads, jambs, and between pairs of doors. Provide 1/2 inch (13 mm) from bottom of door to top of decorative floor finish or covering. Where threshold is shown or scheduled, provide 3/8 inch (10 mm) from bottom of door to top of threshold.
      a. Comply with NFPA 80 for fire-rated doors.
   2. Bevel non-fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) at lock and hinge edges.
   3. Bevel fire-rated doors 1/8 inch in 2 inches (3-1/2 degrees) on lock edge; trim stiles and rails only to extent permitted by labeling agency.

E. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.

F. Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

3.3 ADJUSTING

A. Operation: Rehang or replace doors that do not swing or operate freely.

B. Finished Doors: Replace doors that are damaged or do not comply with requirements. Doors may be repaired or refinished if Work complies with requirements and shows no evidence of repair or refinishing.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Separate the following categories for disposal and place in designated areas for hazardous materials:
   1. Treated, stained, painted or contaminated wood.

END OF SECTION 08 14 33
SECTION 08 31 13 - ACCESS DOORS AND FRAMES [C]

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Access doors and frames for walls and ceilings.

B. Related Requirements:
   1. Division 07 Section "Roof Accessories" for roof hatches.
   2. Division 08 Section "Door Hardware" for mortise or rim cylinder locks and master keying.
   3. Division 09 Section “Painting” for requirements for shop priming.
   4. Division 22 Section “Plumbing” for pipe and valve access doors.

1.3 ALLOWANCES

A. The General Trades Contractor should carry a $15,000 material allowance for access panels on this project and include labor for installation of 60 access panels. Once final quantities are determined the General Trades Contractor should provide the Construction Manager (3) proposals for the sizes and quantities needed. If the final cost of the access panels is lower than the allowance, a credit will be issued to the owner. The Owner reserves the right to supply the access panel for the project and recoup the entire allowance amount. [C]

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, fire ratings, materials, individual components and profiles, and finishes.

B. Shop Drawings:
   1. Include plans, elevations, sections, details, and attachments to other work.
   2. Detail fabrication and installation of access doors and frames for each type of substrate.

C. Samples: For each door face material, at least 3 by 5 inches (75 by 125 mm) in size, in specified finish.

D. Product Schedule: Provide complete access door and frame schedule, including types, locations, sizes, latching or locking provisions, and other data pertinent to installation.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Rated Access Doors and Frames: Units complying with NFPA 80 that are identical to access door and frame assemblies tested for fire-test-response characteristics according to the following
test method and that are listed and labeled by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
1. NFPA 252 or UL 10B for fire-rated access door assemblies installed vertically.
2. NFPA 288 for fire-rated access door assemblies installed horizontally.

2.2 ACCESS DOORS AND FRAMES FOR WALLS AND CEILINGS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Acudor Products, Inc.
2. Cendrex Inc.
3. Jensen Industries; Div. of Broan-Nutone, LLC.
7. Milcor Inc.
8. Nystrom, Inc.

B. Flush Access Doors with Concealed Flanges:
1. Assembly Description: Fabricate door to fit flush to frame. Provide frame with gypsum board or plaster beads for concealed flange installation.
2. Locations: Wall and ceiling.
3. Uncoated Steel Sheet for Door: Nominal 0.060 inch (1.52 mm), 16 gage.
4. Stainless-Steel Sheet for Door: Nominal 0.062 inch (1.59 mm), 16 gage.
   a. Finish: No. 4.
5. Frame Material: Same material and thickness as door.
7. Hardware: Cam latch operated by screwdriver with interior release.

C. Fire-Rated, Flush Access Doors with Concealed Flanges:
1. Assembly Description: Fabricate door to fit flush to frame, with a core of mineral-fiber insulation enclosed in sheet metal. Provide self-latching door with automatic closer and interior latch release. Provide frame with gypsum board or plaster beads for concealed flange installation.
2. Locations: Wall and ceiling.
3. Fire-Resistance Rating: Not less than that indicated.
4. Temperature-Rise Rating: 250 deg F (139 deg C) at the end of 30 minutes.
5. Uncoated Steel Sheet for Door: Nominal 0.036 inch (0.91 mm), 20 gage.
6. Stainless-Steel Sheet for Door: Nominal 0.038 inch (0.95 mm), 20 gage.
   a. Finish: No. 4.
7. Frame Material: Same material, thickness, and finish as door.
8. Hinges: Concealed pin type.
10. Lock: Self-latching device with cylinder lock.
    a. Lock Preparation: Prepare door panel to accept cylinder specified in Division 08 Section "Door Hardware."

2.3 MATERIALS

A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.
C. Steel Sheet: Uncoated or electrolytic zinc coated, ASTM A 879/A 879M, with cold-rolled steel sheet substrate complying with ASTM A 1008/A 1008M, Commercial Steel (CS), exposed.

D. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum G60 (Z180) or A60 (ZF180) metallic coating.

E. Rolled-Stainless-Steel Floor Plate: ASTM A 793, manufacturer's standard finish.

F. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 316. Remove tool and die marks and stretch lines or blend into finish.

G. Frame Anchors: Same type as door face.

H. Inserts, Bolts, and Anchor Fasteners: Hot-dip galvanized steel according to ASTM A 153/A 153M or ASTM F 2329.

I. Drywall Beads: Edge trim formed from 0.0299-inch zinc-coated steel sheet formed to receive joint compound and in size to suit thickness of gypsum board.

J. Plaster Beads: Casing bead formed from 0.0299-inch zinc-coated steel sheet with flange formed out of expanded metal lath and in size to suit thickness of plaster.

2.4 FABRICATION

A. General: Provide access door and frame assemblies manufactured as integral units ready for installation.

B. Metal Surfaces: For metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

C. Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access doors to types of supports indicated.
   1. For concealed flanges with drywall bead, provide edge trim for gypsum board and gypsum base securely attached to perimeter of frames.
   2. For concealed flanges with plaster bead for full-bed plaster applications, provide zinc-coated expanded metal lath and exposed casing bead welded to perimeter of frames.
   3. Provide mounting holes in frames for attachment of units to metal or wood framing.
   4. Provide mounting holes in frame for attachment of masonry anchors.

D. Latching Mechanisms: Furnish number required to hold doors in flush, smooth plane when closed.
   1. For cylinder locks, furnish two keys per lock and key all locks alike.

2.5 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Steel and Metallic-Coated-Steel Finishes:
1. Factory Prime: Apply manufacturer’s standard, fast-curing, lead- and chromate-free, universal primer immediately after surface preparation and pretreatment.

E. Stainless-Steel Finishes:
   1. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
   2. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.
      a. Run grain of directional finishes with long dimension of each piece.
      b. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
      c. Directional Satin Finish: No. 4.

PART 3 - EXECUTION

3.1 EXAMINATION
   A. Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
   B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION
   A. Comply with manufacturer's written instructions for installing access doors and frames.
   B. Install doors flush with adjacent finish surfaces or recessed to receive finish material.

3.3 ADJUSTING
   A. Adjust doors and hardware, after installation, for proper operation.
   B. Remove and replace doors and frames that are warped, bowed, or otherwise damaged.

3.4 WASTE MANAGEMENT
   A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
   B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
      1. Aluminum.
      2. Plastic Materials
      3. Corrugated cardboard packaging.
   C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 31 13
SECTION 08 33 23 – ROLLING FIRE DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Fire-rated counter doors.
   2. Prefinished custom formed trim as shown in the Drawings.

B. Related Sections:
   1. Division 05 Section “Metal Fabrications” for miscellaneous steel supports.
   2. Division 09 Section “Interior Painting” for finish painting of factory-primed doors.
   3. Division 26 Sections for electrical service and connections for powered operators and accessories.

1.3 PERFORMANCE REQUIREMENTS

A. Provide doors with Underwriter’s Laboratories, Inc. label for the fire rating classification, 1-1/2 hr.

B. Provide doors with Underwriter’s Laboratories, Inc. label for “Leakage Rated Assembly” or ‘S’ label.
   1. Comply with NFPA 105 air leakage requirements.
   2. Pass UL test procedure 1784.

C. Seismic Performance: coiling doors shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.
   1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
   2. Seismic Component Importance Factor: 1.25.

D. Operation Cycles: Provide overhead coiling door components and operators capable of operating for not less than number of cycles indicated for each door. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position.

1.4 ACTION SUBMITTALS

A. Product Data: For each type and size of overhead coiling door and accessory. Include the following:
   1. Construction details, material descriptions, dimensions of individual components, profiles for slats, and finishes.
   2. Rated capacities, operating characteristics, electrical characteristics, and furnished accessories.
   3. For fire-rated doors, description of fire-release system including testing and resetting instructions.

B. Shop Drawings: For each installation and for special components not dimensioned or detailed in manufacturer's product data. Include plans, elevations, sections, details, and attachments to other work.
1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
2. Show locations of replaceable fusible links.
3. Wiring Diagrams: For power, signal, and control wiring.

C. Samples for Initial Selection: Manufacturer's finish charts showing full range of colors and textures available for units with factory-applied finishes.
   1. Include similar Samples of accessories involving color selection.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
   2. Bottom Bar: 6 inches long.
   5. Hood: 6 inches square.
   6. Laminate-Clad Counter Panel Product: 6 inches square; for each type, color, pattern, and surface finish; laminated to core.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Seismic Qualification Certificates: For overhead coiling doors, accessories, and components, from manufacturer.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For overhead coiling doors to include in maintenance manuals.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project.

B. Source Limitations: Obtain overhead coiling doors from single source from single manufacturer.
   1. Obtain operators and controls from overhead coiling door manufacturer.
   2. Manufacturer shall be ISO 9001:2000 registered with a minimum of five years experience in producing counter fire doors of the type specified.

C. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at as close to neutral pressure as possible according to UL 10B.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

PART 2 - PRODUCTS
2.1 DOOR CURTAIN MATERIALS AND CONSTRUCTION

A. Door Curtains: Fabricate overhead coiling-door curtain of interlocking metal slats, designed to withstand wind loading indicated, in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of thickness and mechanical properties recommended by door manufacturer for performance, size, and type of door indicated, and as follows:
   1. Steel Door Curtain Slats: Zinc-coated (galvanized), cold-rolled structural steel sheet; complying with ASTM A 653/A 653M, with G90 (Z275) zinc coating; nominal sheet thickness (coated) of 0.028 inch and as required to meet requirements.

B. Bottom Bar for Counter Doors: Manufacturer's standard continuous channel or tubular shape, fabricated from manufacturer's standard hot-dip galvanized steel, stainless steel, or aluminum extrusions to match curtain slats and finish.

C. Astragal for Interior Doors: Equip each door bottom bar with a replaceable, adjustable, continuous, compressible gasket of flexible vinyl, rubber, or neoprene as a cushion bumper.

D. Curtain Jamb Guides: Manufacturer's standard angles or channels and angles of same material and finish as curtain slats unless otherwise indicated, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain.

E. Custom Prefinished Formed Metal Trim: Formed of the same material and finish as curtain slats unless otherwise indicated. Manufacture and install cleats and finish trim as shown on the Drawings.

2.2 HOOD

A. General: Form sheet metal hood to entirely enclose coiled curtain and operating mechanism at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Form closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting that projects beyond wall face. Equip hood with intermediate support brackets as required to prevent sagging.
   1. Galvanized Steel: Nominal 0.028-inch thick, hot-dip galvanized steel sheet with G90 (Z275) zinc coating, complying with ASTM A 653/A 653M.
   2. Include automatic drop baffle on fire-rated doors to guard against passage of smoke or flame.

2.3 COUNTER DOORS

A. Fire-Rated, Laminate Counter: Fire-door manufacturer's high-pressure decorative laminate-covered countertop, UL or ITS tested and labeled for 1-1/2-hour fire rating for approved use with fire-door assembly.

2.4 CURTAIN ACCESSORIES

A. Push/Pull Handles: Equip each push-up-operated or emergency-operated door with lifting handles on each side of door, finished to match door.
   1. Provide pull-down straps or pole hooks for doors more than 84 inches high.

B. Automatic-Closing Device for Fire-Rated Doors: Equip each fire-rated door with an automatic-closing device that is inoperative during normal door operations and that has a governor unit complying with NFPA 80 and an easily tested and reset release mechanism designed to be activated by the following:
   1. Replaceable fusible links with temperature rise and melting point of 165 deg F interconnected and mounted on both sides of door opening.
   2. Building fire-detection and -alarm systems and manufacturer's standard door-holder-release devices.
2.5 COUNTERBALANCING MECHANISM

A. General: Counterbalance doors by means of manufacturer's standard mechanism with an adjustable-tension, steel helical torsion spring mounted around a steel shaft and contained in a spring barrel connected to top of curtain with barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.

B. Counterbalance Barrel: Fabricate spring barrel of manufacturer's standard hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of slats and to limit barrel deflection to not more than 0.03 in./ft. of span under full load.

C. Spring Balance: One or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Secure ends of springs to barrel and shaft with cast-steel barrel plugs.

D. Torsion Rod for Counterbalance Shaft: Fabricate of manufacturer's standard cold-rolled steel, sized to hold fixed spring ends and carry torsional load.

E. Brackets: Manufacturer's standard mounting brackets of either cast iron or cold-rolled steel plate.

2.6 MANUAL DOOR OPERATORS

A. Equip door with manufacturer's recommended manual door operator unless another type of door operator is indicated.

B. Push-up Door Operation: Design counterbalance mechanism so required lift or pull for door operation does not exceed 25 lbf.

2.7 FIRE-RATED DOOR ASSEMBLY

A. Fire-Rated Counter Door: Overhead fire-rated coiling door formed with curtain of interlocking metal slats.
   1. Basis-of-Design Product: Subject to compliance with requirements, provide Model ERC10 as manufactured by Cornell Iron Works, Inc., or comparable product by another manufacturer, including but not limited to one of the following:
      a. ACME Rolling Doors.
      b. Alpine Overhead Doors, Inc.
      c. Cornell Iron Works, Inc.

B. Operation Cycles: Not less than 20,000.

C. Fire Rating: 1-1/2 hours.

D. Door Curtain Material: Galvanized steel.

E. Door Curtain Slats: Flat profile slats of 1-1/2-inch center-to-center height.

F. Curtain Jamb Guides: Galvanized steel with exposed finish matching curtain slats.

G. Hood: Match curtain material and finish.
   1. Shape: Square, As shown on Drawings.
   2. Mounting: As shown on Drawings.

H. Sill Configuration for Fire-Rated Counter Door: Fire-rated, laminate counter.
   1. High-Pressure Decorative Laminate: Match color, pattern, and finish of Architect's sample.

J. Door Finish:
   1. Baked-Enamel or Powder-Coated Finish: One color used, to be selected from manufacturer’s range of standard and premium colors.
   2. Interior Curtain-Slat Facing: Match finish of exterior curtain-slat face.

2.8 GENERAL FINISH REQUIREMENTS

   A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

   B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.9 STEEL AND GALVANIZED-STEEL FINISHES

   A. Factory Prime Finish – Concealed Components: Manufacturer's standard primer, compatible with field-applied finish. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness.

   B. Baked-Enamel or Powder-Coat Finish – on All Exposed Surfaces: Manufacturer's standard baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

   A. Examine substrates areas and conditions, with Installer present, for compliance with requirements for substrate construction and other conditions affecting performance of the Work.

   B. Examine locations of electrical connections.

   C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

   A. Install overhead coiling doors and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports; according to manufacturer's written instructions and as specified.

   B. Install overhead coiling doors, hoods, and operators at the mounting locations indicated for each door.

   C. Accessibility: Install overhead coiling doors, switches, and controls along accessible routes in compliance with regulatory requirements for accessibility.

   D. Fire-Rated Doors: Install according to NFPA 80.

3.3 STARTUP SERVICE

   A. Engage a factory-authorized service representative to perform startup service.
      1. Perform installation and startup checks according to manufacturer's written instructions.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Test door closing when activated by detector or alarm-connected fire-release system. Reset door-closing mechanism after successful test.

3.4 ADJUSTING

A. Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.
B. Lubricate bearings and sliding parts as recommended by manufacturer.
C. Adjust seals to provide weathertight fit around entire perimeter.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling doors.

3.6 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
B. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

C. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 33 23
SECTION 08 41 13 – ENTRANCE DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Exterior and interior manual-swing entrance doors and door-frame units.
   2. Fire stair exit door & frame.

B. Related Sections:
   1. Division 08 Section "Frameless Glass Doors & Storefronts" for systems without aluminum support framing.
   2. Division 08 Section “Door Hardware” for hardware to be installed on entrance and exit doors, and for automatic door operators.
   3. Division 08 Section “Glazing” for glazing to be stopped into entrance doors and frames.
   4. Division 08 Section "Glazed Aluminum Curtain Walls" for aluminum curtain wall assemblies, and for coordinating finishes among aluminum fenestration units.
   5. Division 08 Section "Aluminum Windows" for window mullion inserts set into aluminum doors, and for coordinating finishes among aluminum fenestration units.

1.3 DEFINITIONS

A. ADA/ABA Accessibility Guidelines: U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disability Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities."

1.4 PERFORMANCE REQUIREMENTS

A. General Performance: Entrance doors and frames shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction:

   1. Movements of supporting structure indicated on Drawings including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads.
   2. Dimensional tolerances of building frame and other adjacent construction.
   3. Failure includes the following:
      a. Deflection exceeding specified limits.
      b. Thermal stresses transferring to building structure.
      c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.
      d. Glazing-to-glazing contact.
e. Noise or vibration created by wind and by thermal and structural movements.
f. Loosening or weakening of fasteners, attachments, and other components.
g. Sealant failure.
h. Failure of operating units.

B. Structural Loads:
1. Wind Loads: As indicated on Drawings.
   a. Basic Wind Speed: As indicated on Drawings.
   b. Importance Factor: As indicated on Drawings.
   c. Exposure Category: As indicated on Drawings.

C. Thermal Movements: Provide aluminum entrance doors and frames that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
2. Interior Ambient-Air Temperature: 75 deg F.

D. Condensation Resistance for Thermally Broken Doors: Provide aluminum entrance doors and frames having condensation-resistance factor (CRF) of not less than 55 when tested according to AAMA 1503.

E. Thermal Conductance for Thermally Broken Doors: Provide aluminum entrance doors and frames having an average U-factor of not more than 0.48 Btu/sq. ft. x h x deg F when tested according to AAMA 1503.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for all systems.

B. LEED Submittals:
1. Product Data for Credit IEQ 4.1: For adhesives and sealants used inside of the weatherproofing system, documentation including printed statement of VOC content.

C. Shop Drawings: For all types of entrance doors and frames. Include plans, elevations, sections, details, and attachments to other work.
1. For entrance doors, include hardware schedule and indicate operating hardware types, functions, quantities, and locations.

D. Samples for Initial Selection: For units with factory-applied color finishes.

E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

F. Other Action Submittals:
1. Entrance Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing fabrication and assembly of entrance door hardware, as well as procedures and
diagrams. Coordinate final entrance door hardware schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

1.6 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified Installer.
B. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency indicating compliance with performance requirements.
C. Source quality-control reports.
D. Warranties: Sample of special warranties.

1.7 CLOSEOUT SUBMITTALS
A. Maintenance Data: For entrance doors and frames to include in maintenance manuals.

1.8 QUALITY ASSURANCE
A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
B. Product Options: Information on Drawings and in Specifications establishes requirements for systems' aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.
1. Do not revise intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If revisions are proposed, submit comprehensive explanatory data to Architect for review.
C. Accessible Entrances: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines and ICC/ANSI A117.1.
D. Source Limitations for Aluminum-Framed Systems: Obtain from single source from single manufacturer.
E. Preinstallation Conference: Conduct conference at Project site.

1.9 PROJECT CONDITIONS
A. Field Measurements: Verify actual locations of curtain wall openings into which entrance doors and frames are to be fitted by field measurements before fabrication and indicate measurements on Shop Drawings.
1.10 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of entrance doors and frames that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Structural failures including, but not limited to, excessive deflection.
   b. Noise or vibration caused by thermal movements.
   c. Deterioration of metals and other materials beyond normal weathering.
   d. Adhesive or cohesive sealant failures.
   e. Water leakage.
   f. Failure of operating components.

2. Warranty Period: Two years from date of Substantial Completion.

B. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: 20 years from date of Substantial Completion.

1.11 MAINTENANCE SERVICE

A. Entrance Door Hardware:

1. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for Owner's continued adjustment, maintenance, and removal and replacement of entrance door hardware.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product for Thermally Broken Entrance Door and Frame: Subject to compliance with requirements, provide “ADS 65 HD” entrance doors as manufactured by Schüco International KG, or comparable product by one of the following:

1. EFCO Corporation.
2. Kawneer North America; an Alcoa company.
3. United States Aluminum.
4. Vistawall Architectural Products; The Vistawall Group; a Bluescope Steel company.
5. Schüco International KG

B. Basis-of-Design Product for Stainless Steel Entrance Door: Subject to compliance with requirements, provide doors by AMBICO Limited, 1120 Cummings Avenue, Ottawa, Ontario, Canada, K1J 7R8, 888-423-2224, or approved equal, as detailed in the Drawings.
2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
   2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221.
   4. Structural Profiles: ASTM B 308/B 308M.
   5. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

B. Stainless Steel: ASTM A240m type 304.

2.3 ALUMINUM ENTRANCE DOOR SYSTEMS

A. Aluminum Entrance Doors: Manufacturer's standard glazed entrance doors for manual-swing operation.
   1. Door Construction: 2-1/2-inch overall thickness, with minimum 0.125-inch- thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods.
      a. Thermal Construction: High-performance plastic connectors separate aluminum members exposed to the exterior from members exposed to the interior.
   2. Door Design: Medium stile; 3-1/2-inch nominal width.
      a. Accessible Doors: Smooth surfaced for width of door in area within 10 inches above floor or ground plane.
      a. Provide nonremovable glazing stops on outside of door.
   4. Provide aluminum subframes for entrance doors where indicated or required at entrance doors installed in aluminum curtain wall assemblies.
   5. Provide 1” thick flat insulated panel set into stile and rail of aluminum door instead of glazing where indicated.
      a. Finish: to match door.
      b. Texture: Smooth; embossed panels will be rejected.

2.4 STAINLESS STEEL DOOR CONSTRUCTION

A. Door Core:
   1. Stiffened: Continuous vertical formed stainless steel sections, 0.026 in. minimum thickness, spaced with interior webs not more than 6 inches apart, which upon assembly, span the full thickness of the interior of the door. Voids between stiffeners shall be filled with fiberglass or mineral rock wool batt type material.
   2. Door Stiles: 4”, or as shown in Drawings.
   3. Door Rails: 6”, or as shown in Drawings.
   4. Face Thickness: 16 Gauge.
5. Construction: Butt seam door construction, longitudinal edges fully welded with no visible edge seam. Door panel will have visible face seams where stiles and rails intersect. Inverted, recessed, welded steel top and bottom steel channels.
6. Flush, stainless steel top caps on exterior doors.
7. Stainless steel hardware reinforcement plates welded in place.

2.5 ENTRANCE DOOR HARDWARE

A. General: Door manufacturer to provide entrance door hardware as indicated in this Section for each entrance door to comply with requirements of this Section.

B. Entrance Door Hardware by others: As specified in Division 08 Section “Door Hardware.”

C. Coordinate final entrance door hardware, whether provided by door manufacturer or others, with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

D. Weather Stripping: Manufacturer's standard replaceable components.
   1. Compression Type: Made of ASTM D 2000, molded neoprene, or ASTM D 2287, molded PVC.
   2. Sliding Type: AAMA 701, made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.

E. Weather Sweeps: Manufacturer's standard exterior-door bottom sweep with concealed fasteners on mounting strip.

2.6 ACCESSORY MATERIALS

A. Joint Sealants: For installation at perimeter of aluminum-framed systems, as specified in Division 07 Section "Joint Sealants."
   1. Sealants used inside the weatherproofing system shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. Bituminous Paint: Cold-applied, asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos; formulated for 30-mil thickness per coat.

2.7 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Framing Members, General: Fabricate components that, when assembled, have the following characteristics:
   1. Profiles that are sharp, straight, and free of defects or deformations.
   2. Accurately fitted joints with ends coped or mitered.
   3. Means to drain water passing joints, condensation within framing members, and moisture migrating within the system to exterior.
4. Physical and thermal isolation of glazing from framing members.
5. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Entrance Door Frames: Reinforce as required to support loads imposed by door operation and for installing entrance door hardware.
   1. At exterior doors, provide compression weather stripping at fixed stops.
   2. At interior vestibule doors, provide compression weather stripping at fixed stops.

E. Entrance Doors: Reinforce doors as required for installing entrance door hardware.
   1. At pairs of exterior doors, provide sliding-type weather stripping retained in adjustable strip and mortised into door edge.
   2. At exterior doors, provide weather sweeps applied to door bottoms.

F. Entrance Door Hardware Installation: Factory install entrance door hardware to the greatest extent possible. Cut, drill, and tap for factory-installed entrance door hardware before applying finishes.

G. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.8 ALUMINUM FINISHES

A. High-Performance Organic Finish: 3-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   1. Color and Gloss: Match Architect's sample
   2. Number of Colors: Two.
   3. Both solid and metallic colors will be used.
   4. One or more colors will be required to match the aluminum curtain wall exactly.
   5. One or more colors will be required to match the aluminum windows exactly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:
   1. Comply with manufacturer's written instructions.
   2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure nonmovement joints.
5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic
deterioration.
6. Seal joints watertight unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting
contact surfaces with primer or applying sealant or tape, or by installing nonconductive
spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting
contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members,
and moisture migrating within the system to exterior.

D. Install components plumb and true in alignment with established lines and grades, and without warp
or rack.

E. Entrance Doors: Install doors to produce smooth operation and tight fit at contact points.

1. Exterior Doors: Install to produce weathertight enclosure and tight fit at weather stripping.
2. Field-Installed Entrance Door Hardware: Install surface-mounted entrance door hardware
according to entrance door hardware manufacturers' written instructions using concealed
fasteners to greatest extent possible.

F. Install perimeter joint sealants as specified in Division 07 Section "Joint Sealants" to produce
weathertight installation.

3.3 ERECTION TOLERANCES

A. Install aluminum-framed systems to comply with the following maximum erection tolerances:

1. Location and Plane: Limit variation from true location and plane to 1/8 inch in 12 feet; 1/4
inch over total length.
2. Alignment:
   a. Where surfaces abut in line, limit offset from true alignment to 1/16 inch.
   b. Where surfaces meet at corners, limit offset from true alignment to 1/32 inch.

B. Diagonal Measurements: Limit difference between diagonal measurements to 1/8 inch.

3.4 ADJUSTING

A. Adjust operating entrance door hardware to function smoothly as recommended by manufacturer.

1. For entrance doors accessible to people with disabilities, adjust closers to provide a 3-second
closer sweep period for doors to move from a 70-degree open position to 3 inches from the
latch, measured to the leading door edge.
3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Stainless steel.
   3. Plastic Materials

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 41 13
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 08 41 26 – FRAMELESS GLASS DOORS & STOREFRONT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
1. Interior manual-swinging all-glass entrance doors.
2. Interior all-glass storefronts.
B. Related Sections:
1. Division 05 Section "Metal Fabrications" for overhead-steel support for all-glass systems.
2. Division 08 Section "Glazing" for general glass requirements.

1.3 DEFINITIONS
A. ADA/ABA Accessibility Guidelines: U.S. Architectural & Transportation Barriers Compliance Board’s "Americans with Disability Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities."

1.4 PERFORMANCE REQUIREMENTS
A. General Performance: All-glass systems shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction.
B. Structural Performance: All-glass systems shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated according to SEI/ASCE 7.
1. Seismic Loads: As indicated on Drawings.
2. Deflection Limits: Deflection normal to glazing plane is limited to 1/175 of clear span or 3/4 inch, whichever is smaller.
C. Delegated Design: Design all-glass systems, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

1.5 ACTION SUBMITTALS
A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for all-glass system.
B. Shop Drawings: Show fabrication and installation details, including the following:
1. Plans, elevations, and sections.
2. Details of fittings and glazing, including isometric drawings of patch and rail fittings.
3. Door hardware locations, mounting heights, and installation requirements.

C. Samples for Initial Selection: For each type of exposed finish indicated.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
   1. Metal Finishes: 6-inch-long sections of patch and rail fittings, accessory fittings, and other items.
   2. Glass: 6 inches square, showing exposed-edge finish and all colors & translucencies of glass in project.
   3. Door Hardware: For exposed door hardware of each type, in specified finish, full size.

E. Fabrication Sample: Of patch fitting at sill on pivot side only and continuous rail fitting at bottom of all-glass systems, made from 12-inch lengths of full-size components and showing details of the following:
   1. Joinery.
   2. Anchorage.

F. Other Action Submittals:
   1. Entrance Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing fabrication and assembly of entrance door hardware, as well as procedures and diagrams. Coordinate final entrance door hardware schedule with doors, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

G. Delegated-Design Submittal: For all-glass systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Detail fabrication and assembly of all-glass systems.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Seismic Qualification Certificates: For all-glass systems, accessories, and components, from manufacturer.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for all-glass systems.

D. Warranty: Sample of special warranty.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For all-glass systems to include in maintenance manuals.
1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: Curved, laminated, fritted glass manufacturer shall provide proof of 10 years experience in frit application and 20 years experience with laminating and bending glass, and 5 years experience in the manufacturing of heavy tempered glass doors.

B. Installer Qualifications: Manufacturer’s authorized representative who is trained and approved for installation of units required for this Project.
   1. Installer shall provide evidence of three successful installations of similar frameless heavy glass door and wall systems over the past five years.

C. Engineering Responsibility: Prepare data for all-glass systems, including Shop Drawings, based on testing and engineering analysis of manufacturer’s standard units in systems similar to those indicated for this Project.

D. Source Limitations: Obtain all-glass systems from single source from single manufacturer.

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockups for all-glass systems including entrance door hardware, patch and rail fittings, and accessory fittings.
   2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

F. Accessible All-Glass Entrance Doors: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board’s ADA-ABA Accessibility Guidelines and ICC/ANSI A117.1.

G. Preinstallation Conference: Conduct conference at Project site.

1.9 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with all-glass systems by field measurements before fabrication and indicate measurements on Shop Drawings.

1.10 WARRANTY

A. Special Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace components of all-glass systems that do not comply with requirements or that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including excessive deflection.
      b. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
      c. Any defect materially obstructing vision through the glass.
      d. Failure of operating components.
   2. Warranty Period: Five years from date of Substantial Completion, except as follows:
      a. Concealed Floor Closers: Ten years from date of Substantial Completion.
1.11 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 months' full maintenance by skilled employees of all-glass system Installer. Include quarterly preventive maintenance, repair, or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper all-glass system operation. Provide parts and supplies the same as those used in the manufacture and installation of original equipment.

B. Continuing Maintenance Proposal: From Installer to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

PART 2 - PRODUCTS

2.1 METAL COMPONENTS

A. Basis-of-Design Product for Patches and other Hardware: The design of the patches and other hardware for the all-glass entrance and storefront is based on the following systems as manufactured by DORMA Glas, Inc., or approved equal.

B. Fitting Configuration for Doors and Transoms

1. Universal Patch Fittings as manufactured by DORMA Glas, Inc., or equal. Required fittings as shown on the Drawings include, but are not limited to:
   a. PT-10 Bottom Patch w/insert for floor closer, pivot, or round pivot 14 mm dia.
   b. PT-20 Top Patch w/safety insert for top pivot 15 mm dia.
   c. PT-30 Transom Patch w/pivot 15 mm dia, w/M8 tapped hole at side OR w/stop insert, w/M8 tapped hole at side OR w/blank insert, w/M8 tapped hole at side OR w/blank insert
   d. PT-40 Transom Sidelight Patch w/pivot 15 mm dia OR w/stop insert OR w/blank insert
   e. PT-62 Transom Sidelite Connector w/fixed stop

2. Manual-Swinging, All-Glass Entrance Doors and Transoms: Provide Dorma-Glas Type A, F & BP glass doors, or equal. Top and bottom patch fittings are 2” x 6 ½” and are made up of 3 components: base fitting, insert and cover.
   a. Base Fitting: Cast Aluminum.
   b. Snap On Cover: ASTM A 666, Type 304. Stainless steel, brushed finish.
   c. Inserts: Combination of aluminum and hardened steel.
   d. Gaskets: Hakosil Fiber Gasket is used to obtain maximum coefficient of friction between glass and aluminum assembly.
   e. Top and bottom patch fittings have inserts to accommodate the pivot/closer mechanisms.
   f. Bottom patch lock is 2 ½” x 6 ½” and has round blot lock which engages into flat mount or dust proof strikes.

C. All-Glass Storefronts: Recessed glazing channel at top and bottom.

   1. Bottom Dri-Fit U-Channel, 1” x 1”, recessed into floor
   2. Top Dri-Fit U-Channel, 1” x 1-3/4”, recessed into ceiling

D. Anchors and Fastenings: Concealed.
2.2 GLASS
A. Material: ASTM C 1048, Kind FT (fully tempered), Condition A (uncoated surfaces), Type I (transparent), tested for surface and edge compression per ASTM C 1048 and for impact strength per 16 CFR 1201 for Category II materials.

B. Basis-of-Design Product: Subject to performance requirements, use tempered glass as manufactured by Dlubak Corporation, 800.336.0562, or approved equal.
   1. Glazing Type GL - 7: Clear monolithic tempered.
      a. Thickness: 1/2 inch.
      b. Locations: As indicated.
   2. Glazing Type GL - 8: Translucent tempered.
      a. Color: White
      b. Thickness: NOMINAL 9/16”.
      c. Glass Construction: ¼” clear + 030” Translucent White + ¼” clear.
      d. Glass Interlayer: White, 65% L.T. as supplied by DuPont or Solutia.
      e. Locations: As indicated.

4. Butt Edges: Flat ground.
5. Corner Edges: Lap-joint corners with exposed edges polished.

2.3 ENTRANCE DOOR HARDWARE
A. General: Heavy-duty entrance door hardware units in sizes, quantities, and types recommended by manufacturer for all-glass entrance systems indicated. For exposed parts, match metal and finish of patch fittings.

B. Basis-of-Design Product for Door Hardware: The design of the door hardware for the all-glass entrance and storefront is based on the following systems as manufactured by C.R.Laurence Co., Inc or equal.

C. Concealed Floor Closers and Top Pivots: Center hung; BHMA A156.4, Grade 1; including cases, bottom arms, top walking beam pivots, plates, and accessories required for complete installation.
   1. Swing: Single and Double acting.
      a. Positive Dead Stop: Coordinated with hold-open angle if any, or at angle selected.
   2. Opening-Force Requirements:

D. Single-Door and Active-Leaf Locksets: Center-housing combination deadbolt and latchbolt with lever handles.
   1. Provide center lock glass keeper on jamb opposite latch.

E. Cylinders: As specified in Division 08 Section "Door Hardware."
   1. Locksets must be compatible with Owner’s Best 7-pin keying system.

F. Hardware Finish: ASTM A 666, Type 304, Stainless Steel, brushed finish.
G. Lever Design: Lever design to match levers on doors supplied by others - Schlage “danmark” lever (model 615) as manufactured by Ingersoll Rand.

H. Hardware sets shall be as follows (per door listed):

1) Doors 017a and 420
   1 EA Cylinder lock by others
   1 EA CRL 6’x10” Center Lock w/ danmark 615 lever – classroom function
   1 EA CRL 6’x10” Center Lock Glass Keeper
   1 EA CRL Floor Stop DL2522A

2) Door 115
   1 EA Cylinder Lock by others
   1 EA CRL 6’x10” Center Lock w/ danmark 615 lever – classroom function
   1 EA CRL 6’x10” Center Lock Glass Keeper
   1 EA CRL Wall Stop DL2511A

3) Doors 118, 221 and 417
   1 EA Cylinder Lock by others
   1 EA CRL 6’x10” Center Lock w/ danmark 615 lever – office function
   1 EA CRL 6’x10” Center “Entrance” Lock Glass Keeper
   1 EA CRL Floor Stop DL2522A

4) Doors 219 and 314
   3 EA Cylinder Locks by others
   1 EA CRL 6’x10” Center Lock w/ danmark 615 lever – classroom function
   1 EA CRL 6’x10” Center Lock Glass Keeper
   2 EA CRL Floor Stop DL2522A
   2 EA CRL AMR215 Series Patchlock w/ thumbturn on interior side (one at bottom of inactive leaf, one at top of inactive leaf)
   1 EA CRL Spring-loaded Dustproof Keepers (bottom of inactive leaf)
   1 EA CRL AMR Series Glass Door Mount Keeper to accept patchlock bolt (top of inactive leaf)

5) Door 316a
   1 EA Cylinder Lock by others
   1 EA CRL 6’x10” Center Lock w/ danmark 615 lever – classroom function
   1 EA CRL 6’x10” Center Lock Glass Keeper
   1 EA CRL Floor Stop DL2522A
   1 EA CRL Jackson 900 Series Spring Power Adjustable Floor Closer
   1 EA CRL Bottom Door Patch Fitting with Insert for Floor Closer Spindle

2.4 **FABRICATION**

A. Provide holes and cutouts in glass to receive hardware, fittings, and accessory fittings before tempering glass. Do not cut, drill, or make other alterations to glass after tempering.

1. Fully temper glass using horizontal (roller-hearth) process, and fabricate so that when glass is installed, roll-wave distortion is parallel with bottom edge of door or lite.

B. Factory assemble components and factory install hardware and fittings to greatest extent possible.

2.5 **ALUMINUM FINISHES**

A. Clear Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm or thicker.
2.6 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.
   1. Run grain of directional finishes with long dimension of each piece.
   2. Directional Satin Finish: No. 4.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install all-glass systems and associated components according to manufacturer's written instructions.

B. Set units level, plumb, and true to line, with uniform joints.

C. Maintain uniform clearances between adjacent components.

D. Lubricate hardware and other moving parts according to manufacturer's written instructions.

E. Set, seal, and grout floor closer cases as required to suit hardware and substrate indicated.

F. Install joint sealants as specified in Division 07 Section "Joint Sealants" and to produce weathertight installation.

3.3 ADJUSTING AND CLEANING

A. Adjust all-glass entrance doors and hardware to produce smooth operation and tight fit at contact points and weather stripping.
   1. For all-glass entrance doors accessible to people with disabilities, adjust closers to provide a 3-second closer sweep period for doors to move from a 70-degree open position to 3 inches from the latch measured to the leading door edge.

B. Remove excess sealant and glazing compounds and dirt from surfaces.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 41 26
SECTION 08 44 13 - GLAZED ALUMINUM CURTAIN WALLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section includes the following:
   1. Conventionally glazed aluminum curtain walls installed as stick assemblies.
   2. Field-glazed structural-sealant-glazed curtain wall assemblies.
   3. Prefinished alum trim attached to curtain wall.
   4. Insulated aluminum spandrel panels stopped into curtain wall systems.
   5. Miscellaneous aluminum extrusions affixed to curtain wall.
   6. False curtain wall caps attached to other materials as trim.

B. Related Sections:
   1. Miscellaneous aluminum extrusions affixed to curtain wall shall comply with this Section and with Division 5 Section "Decorative Metals."
   2. Division 07 Section "Joint Sealants" for installation of joint sealants installed with glazed aluminum curtain walls and for sealants to the extent not specified in this Section.
   3. Division 08 "Aluminum Windows" for coordinating finishes among aluminum fenestration units and for mullion inserts to be attached to curtain wall frame members.
   4. Division 08 Section "Entrance Doors" for aluminum entrance door assemblies and stainless steel doors, and for coordinating finishes among aluminum fenestration units.
   5. Division 08 Section "Sloped Glazing Assemblies" for sloped glazing.

1.3 ALLOWANCES
A. Provide field quality-control testing as part of testing and inspecting allowance.

1.4 PERFORMANCE REQUIREMENTS
A. General Performance: Comply with performance requirements specified, as determined by testing of manufacturer's standard glazed aluminum curtain walls representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.
   1. Glazed aluminum curtain walls shall withstand movements of supporting structure including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
   2. Failure also includes the following:
      a. Thermal stresses transferring to building structure.
      b. Glass breakage.
      c. Noise or vibration created by wind and thermal and structural movements.
      d. Loosening or weakening of fasteners, attachments, and other components.
      e. Failure of operating units.

B. Delegated Design: Design glazed aluminum curtain walls, including comprehensive engineering analysis by a qualified professional engineer registered in the state of Pennsylvania, using performance requirements and design criteria indicated.

C. Structural Loads:
1. Wind Loads: Criteria as indicated on Drawings.

D. Structural-Test Performance: Test according to ASTM E 330 as follows:
1. When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
2. When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main framing members exceeding 0.2 percent of span.
3. Test Durations: As required by design wind velocity, but not less than 10 seconds.

E. Deflection of Framing Members: At design wind pressure, as follows:
1. Deflection Normal to Wall Plane: Limited to edge of glass in a direction perpendicular to glass plane not exceeding L/175 of the glass edge length for each individual glazing lite, 1/175 of clear span for spans up to 13 feet 6 inches (4.1 m) and to 1/240 of clear span plus 1/4 inch (6.35 mm) for spans greater than 13 feet 6 inches (4.1 m) or an amount that restricts edge deflection of individual glazing lites to 3/4 inch (19 mm), whichever is less.
2. Deflection Parallel to Glazing Plane: Limited to L/360 of clear span or 1/8 inch (3.2 mm), whichever is smaller.
3. Cantilever Deflection: Where framing members overhang an anchor point, limit deflection to two times the length of cantilevered member, divided by 175.

F. Seismic Performance: Glazed aluminum curtain walls shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.
1. Component Importance Factor is 1.25.

G. Story Drift: Accommodate design displacement of adjacent stories indicated.
1. Design Displacement: As indicated on Drawings.
2. Test Performance: Meeting criteria for passing based on building occupancy type when tested according to AAMA 501.4 at design displacement and 1.5 times the design displacement.

H. Water Penetration under Static Pressure: No evidence of water penetration through fixed glazing and framing areas when tested according to ASTM E 331 at a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 15 lbf/sq. ft.

I. Water Penetration under Dynamic Pressure: No evidence of water penetration through fixed glazing and framing areas when tested according to AAMA 501.1 at dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 15 lb/sq. ft.
1. Maximum Water Leakage: According to AAMA 501.1 No uncontrolled water penetrating assemblies or water appearing on assemblies' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters that is drained to exterior.

J. Thermal Movements: Allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures:
1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
2. Test Interior Ambient-Air Temperature: 75 deg F (24 deg C).
3. Test Performance: No buckling; stress on glass; sealant failure; excess stress on framing, anchors, and fasteners; or reduction of performance when tested according to AAMA 501.5.

K. Energy Performance: Glazed aluminum curtain walls shall have certified and labeled energy performance ratings in accordance with NFRC.
1. Thermal Transmittance (U-factor): Fixed glazing and framing areas shall have U-factor of not more than 0.40 Btu/sq. ft. x h x deg F (2.55 W/sq. m x K) as determined according to NFRC 100.
2. Solar Heat Gain Coefficient: Fixed glazing and framing areas shall have a solar heat gain coefficient of no greater than 0.25 as determined according to NFRC 200.
3. Air Infiltration: Maximum air leakage through fixed glazing and framing areas of 0.02 cfm/sq. ft. of fixed wall area as determined according to ASTM E 283 at a minimum static-air-pressure differential of 6.24 lbf/sq. ft.

4. Condensation Resistance: Fixed glazing and framing areas shall have an NFRC- certified condensation resistance rating of no less than 46 as determined according to NFRC 500.

L. Sound Transmission: Provide glazed aluminum curtain walls with fixed glazing and framing areas having the following sound-transmission characteristics:
   1. Outdoor-Indoor Transmission Class: Minimum 32 when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 1332.

M. Structural Sealant: Capable of withstanding tensile and shear stresses imposed by structural-sealant-glazed curtain walls without failing adhesively or cohesively. When tested for preconstruction adhesion and compatibility, cohesive failure of sealant shall occur before adhesive failure.
   1. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant material behind.
   2. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate because sealant-to-substrate bond strength exceeds sealant's internal strength.

N. Structural Sealant Joints:
   1. Designed to carry gravity loads of glazing.
   2. Designed to produce tensile or shear stress of less than 20 psi.
   3. Design reviewed and approved by structural-sealant manufacturer.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. LEED Submittals:
   1. Product Data for Credit IEQ 4.1: For glazing sealants used inside the weatherproofing system, documentation including printed statement of VOC content.

C. Shop Drawings: For glazed aluminum curtain walls. Include plans, elevations, sections, full-size details, and attachments to other work.
   1. Include details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
   2. Include full-size isometric details of each vertical-to-horizontal intersection of glazed aluminum curtain walls, showing the following:
      a. Joinery, including concealed welds.
      b. Anchorage.
      c. Expansion provisions.
      d. Glazing.
      e. Flashing and drainage.
      f. Aluminum channels and trim and anchorages to curtain walls.

D. Samples for Initial Selection: For units with factory-applied color finishes.

E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

F. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch (300-mm) lengths of full-size components and showing details of the following:
   1. Joinery, including concealed welds.
   2. Anchorage.
5. Flashing and drainage.

G. Delegated-Design Submittal: For glazed aluminum curtain walls indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer and testing agency.

B. Seismic Qualification Certificates: For glazed aluminum curtain walls, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

C. Welding certificates.

D. Energy Performance Certificates: For glazed aluminum curtain walls, accessories, and components, from manufacturer.
   1. Basis for Certification: NFRC-certified energy performance values for each glazed aluminum curtain wall.

E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified preconstruction testing agency, for glazed aluminum curtain walls, indicating compliance with performance requirements.

F. Field quality-control reports.

G. Warranties: Sample of special warranties.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For glazed aluminum curtain walls to include in maintenance manuals.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer capable of fabricating glazed aluminum curtain walls that meet or exceed energy performance requirements indicated and of documenting this performance by certification, labeling, and inclusion in lists.
   1. Manufacturer shall have successfully completed a minimum of 5 glazed assemblies of scope, type, and size as proposed project.

B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
   1. Engineering Responsibility: Prepare data for aluminum-framed systems, including Shop Drawings, based on testing and engineering analysis of manufacturer’s standard units in systems similar to those indicated for this Project and submission of reports of tests performed on manufacturer’s standard assemblies.
   2. Installer shall have completed a minimum of 5 installations of similar scope and type was the proposed project.

C. Quality Control Program for Structural-Sealant-Glazed System: Develop quality control program specifically for Project. Document quality-control procedures and verify results for aluminum framed systems. Comply with ASTM C 1401 recommendations including, but not limited to, system material-qualification procedures, preconstruction sealant-testing program, procedures for system fabrication and installation, and intervals of reviews and checks.
D. Testing Agency Qualifications: Qualified according to ASTM E 699 for testing indicated.

E. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.
1. Do not revise intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If revisions are proposed, submit comprehensive explanatory data to Architect for review.
2. Manufacturer shall not modify framing depths from those indicated. If required, manufacturer shall provide internal aluminum or steel reinforcement of curtain wall members to meet Performance Requirements.
3. Manufacturer shall not revise direction or orientation of primary framing members as indicated.
4. Manufacturer shall not modify indicated attachment methods of curtain wall framing or support to adjacent construction.

F. Preconstruction Sealing Testing: For structural-sealant-glazed systems, perform sealant manufacturer's standard tests for compatibility with and adhesion of each material that will come in contact with sealants and each condition required by aluminum-framed systems.
1. Test a minimum of five samples each of metal, glazing and other material.
2. Prepare samples using techniques and primers required for installed systems.
3. Perform tests under environmental conditions that duplicate those under which assemblies will be installed.
4. For materials that fail tests, determine corrective measures necessary to prepare each material to ensure compatibility with and adhesion of sealants including, but not limited to, specially formulated primers. After performing these corrective measures on the minimum number of samples required for each material, retest materials.

G. Source Limitation for Aluminum-Framed Systems: Obtain all curtain wall, storefront and entrances from single source manufacturer.

H. Single installation responsibility: The following components shall be installed by single installation company:
1. Aluminum framing system specified in this section.
2. Sheet metal fabrications and flashings required for joints between aluminum framing and adjacent construction specified in Division 7 Section "Flashing and Sheet Metal."
3. Weatherproofing sealants specified in Division 7 Section “Joint Sealants.”
4. Aluminum glazed door assemblies to be installed in aluminum framing system as specified in Division 8 Section "Aluminum Doors."
5. Glazing specified in Division 8 Section “Glazing.”
6. Alum trim.

J. Structural-Sealant Joints: Design reviewed and approved by structural-sealant manufacturer.

K. Welding Qualifications: Qualify procedures and personnel according to the following:
1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

L. Energy Performance Standards: Comply with NFRC for minimum standards of energy performance, materials, components, accessories, and fabrication. Comply with more stringent requirements if indicated.
1. Provide NFRC-certified glazed aluminum curtain walls with an attached label.
M. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockup of typical wall area as directed by Architect. Glazed aluminum curtain wall mockup shall be incorporated into construction of mockup of adjacent building construction materials.
   2. Field testing shall be performed on mockups according to requirements in "Field Quality Control" Article.
   3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

N. Preinstallation Conference: Conduct conference at Project site.

1.9 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of structural supports for glazed aluminum curtain walls by field measurements before fabrication and indicate measurements on Shop Drawings.

1.10 WARRANTY

A. Special Assembly Warranty: Standard form in which [manufacturer] agrees to repair or replace components of glazed aluminum curtain walls that do not comply with requirements or that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including, but not limited to, excessive deflection.
      b. Noise or vibration created by wind and thermal and structural movements.
      c. Deterioration of metals and other materials beyond normal weathering.
      d. Water penetration through fixed glazing and framing areas.
      e. Failure of operating components.
   2. Warranty Period: Five years from date of Substantial Completion.

B. Special Finish Warranty: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied finishes within specified warranty period.
   1. Deterioration includes, but is not limited to, the following:
      a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
      b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
      c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.
   2. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: The design of the glazed aluminum curtain wall assembly is based on the following systems as manufactured by Schüco International KG, or approved equal:
   1. FW 50+
   2. FW 50+ SG

B. Subject to compliance with requirements, provide the named products or comparable products that meet the sightlines, sizes, configuration, construction, details (including corner details), finish and all other requirements of this Section as manufactured by one of the following:
   1. Kawneer North America; an Alcoa company.
   2. Vistawall Architectural Products; The Vistawall Group; a Bluescope Steel company.
2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated. Shall be comprised of a minimum of 35% recycled material.
   2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
   4. Structural Profiles: ASTM B 308/B 308M.
   5. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

B. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.
   1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
   2. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
   3. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.3 FRAMING

A. Framing Members: Manufacturer's standard extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
      a. Thermal break to be constructed of a polyamide material with a minimum depth of \( \frac{3}{4} \)".
   2. Glazing System: Retained mechanically with gaskets on four sides.
      a. FW 50+: Outside glazed pressure plate format.
      b. FW 50+ SG (Wet-Sealed Joints): Outside glazed silicone glazed (SSG) format.

B. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
   1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
   2. Reinforce members as required to receive fastener threads.
   3. Use exposed fasteners with countersunk Phillips screw heads, finished to match framing system, fabricated from 300 series stainless steel.

D. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch (25.4 mm) that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.
   1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A 123/A 123M or ASTM A 153/A 153M requirements.
   2. Provide special anchors or attachments where indicated and at other locations where attachment will remain exposed to view.

E. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials. Form exposed flashing from sheet aluminum finished to match framing and of sufficient thickness to maintain a flat appearance without visible deflection.

F. Framing Sealants: Manufacturer's standard sealants.

2.4 GLAZING

A. Glazing: Comply with Division 08 Section "Glazing."
B. Glazing Gaskets: Manufacturer's standard sealed-corner pressure-glazing system of black, resilient elastomeric glazing gaskets, setting blocks, and shims or spacers.

C. Glazing Sealants: For structural-sealant-glazed curtain walls, as recommended by manufacturer for joint type, and as follows:
   1. Structural Sealant: ASTM C 1184, chemically curing silicone formulation that is compatible with system components with which it comes in contact, specifically formulated and tested for use as structural sealant and approved by structural-sealant manufacturer for use in curtain-wall assembly indicated.
      a. Provide sealants for use inside of the weatherproofing system that have a VOC content of 100 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
      b. Color: As selected by Architect from manufacturer's full range of colors.
   2. Weatherseal Sealant: ASTM C 920 for Type S; Grade NS; Class 25; Uses NT, G, A, and O; chemically curing silicone formulation that is compatible with structural sealant and other system components with which it comes in contact; recommended by structural-sealant, weatherseal-sealant, and structural-sealant-glazed curtain-wall manufacturers for this use.
      a. Provide sealants for use inside of the weatherproofing system that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
      b. Color: Matching structural sealant.

2.5 OPERABLE UNITS

A. Doors: Comply with Division 08 Section "Aluminum Entrance Doors & Frames."

2.6 PREFINISHED ALUMINUM TRIM

A. Exterior and Interior Extruded Aluminum Trim: Prefinished aluminum sections as indicated on Drawings.

2.7 INSULATED ALUMINUM FILLER PANELS

A. Insulated Spandrel Panels: Laminated, metal-faced flat panels with no deviations in plane exceeding 0.8 percent of panel dimension in width or length.
   1. Overall Panel Thickness: 1 inch.
   2. Exterior Skin: Aluminum.
      a. Thickness: Manufacturer's standard for finish and texture indicated.
      b. Finish: Matching framing system.
      c. Texture: Smooth.
      d. Backing Sheet: Manufacturer's standard.
   3. Interior Skin: Aluminum.
      a. Thickness: Manufacturer's standard for finish and texture indicated.
      b. Finish: Matching curtain-wall framing where exposed, manufacturer's option where concealed.
      c. Texture: Smooth.
      d. Backing Sheet: Manufacturer's standard.
   4. Thermal Insulation Core: Manufacturer's standard rigid, closed-cell, polyisocyanurate board.

2.8 ACCESSORY MATERIALS

A. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil (0.762-mm) thickness per coat.

B. Miscellaneous Trim and Closures: Extruded or fabricated by aluminum-frame system manufacturer from aluminum sheet in finish to match aluminum framing system. Profiles as indicated or otherwise required. All fasteners for attachment to be concealed.
C. Gaskets and Vapor Barriers: Glazing gaskets shall comply with ASTM C 864 and be extruded of a silicone compatible EPDM rubber that provides for silicone adhesion.
   1. Profiles to be specifically designed for framing system and capable of being removed and replaced.

D. Thermal Barrier: Thermal separator shall be extruded of a silicone compatible elastomer that provides for silicone adhesion.
   1. High density plastic isolator thermally breaking pressure plate from mullion.

2.9 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Fabricate components that, when assembled, have the following characteristics:
   1. Profiles that are sharp, straight, and free of defects or deformations.
   2. Accurately fitted joints with ends coped or mitered.
   3. Physical and thermal isolation of glazing from framing members.
   4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
   5. Provisions for field replacement of glazing from exterior.
   6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Fabricate components that, when assembled, have the following characteristics:
   1. Internal guttering system or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within glazed aluminum curtain wall to exterior.
   2. Pressure-equalized system or double barrier design with primary air and vapor barrier at interior side of glazed aluminum curtain wall and secondary seal weeped and vented to exterior.

E. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.10 ALUMINUM FINISHES

A. High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   2. Number of Colors: There will be three (3) colors used for items specified in this section.
   3. Both solid and metallic colors will be used.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 INSTALLATION

A. General:
   1. Comply with manufacturer's written instructions.
   2. Do not install damaged components.
   3. Fit joints to produce hairline joints free of burrs and distortion.
   4. Rigidly secure nonmovement joints.
   5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic
deterioration and to prevent impeding movement of moving joints.
   6. Weld components in concealed locations to minimize distortion or discoloration of finish.
   7. Seal joints watertight unless otherwise indicated.

B. Metal Protection:
   1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting
   contact surfaces with primer or by applying sealant or tape or installing nonconductive
   spacers as recommended by manufacturer for this purpose.
   2. Where aluminum will contact concrete or masonry, protect against corrosion by painting
   contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members,
and moisture migrating within glazed aluminum curtain wall to exterior.

D. Install components plumb and true in alignment with established lines and grades.

E. Install glazing as specified in Division 08 Section "Glazing."

3.3 ERECTION TOLERANCES

A. Erection Tolerances: Install glazed aluminum curtain walls to comply with the following maximum
   tolerances:
   1. Plumb: 1/8 inch in 10 feet (3.2 mm in 3 m); 1/4 inch in 40 feet (6 mm in 12 m).
   2. Level: 1/8 inch in 20 feet (3.2 mm in 6 m); 1/4 inch in 40 feet (6 mm in 12 m).
   3. Alignment:
      a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2
         inch (12.7 mm) wide, limit offset from true alignment to 1/16 inch (1.6 mm).
      b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch (12.7
to 25.4 mm) wide, limit offset from true alignment to 1/8 inch (3.2 mm).
      c. Where surfaces are separated by reveal or protruding element of 1 inch (25.4 mm)
         wide or more, limit offset from true alignment to 1/4 inch (6 mm).
   4. Location: Limit variation from plane to 1/8 inch in 12 feet (3.2 mm in 3.7 m); 1/2 inch (12.7
      mm) over total length.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Services: Testing and inspecting of representative areas of glazed aluminum curtain walls
shall take place as installation proceeds to determine compliance of installed assemblies with
specified requirements.
   1. Air Infiltration: Areas shall be tested for air leakage of 1.5 times the rate specified for
   laboratory testing in "Performance Requirements” Article, but not more than 0.50 cfm/sq. ft.
   (2.25 L/s per sq. m), of fixed wall area when tested according to ASTM E 783 at a minimum
   static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).
      a. Test Area: One bay wide, but not less than 30 feet (9.1 m), by one story of glazed
         aluminum curtain wall.
      b. Perform a minimum of four tests in areas as directed by Architect. One test area for
         each type of curtain wall installed.
2. Water Penetration: Areas shall be tested according to ASTM E 1105 at a minimum uniform static-air-pressure differential of 0.67 times the static-air-pressure differential specified for laboratory testing in "Performance Requirements" Article, but not less than 6.24 lbf/sq. ft. (300 Pa), and shall not evidence water penetration.
   a. Test Area: One bay wide, but not less than 30 feet (9.1 m), by one story of glazed aluminum curtain wall.
   b. Perform a minimum of four tests in areas as directed by Architect. One test area for each type of curtain wall installed.

3. Water Spray Test: Before installation of interior finishes has begun, areas designated by Architect shall be tested according to AAMA 501.2 and shall not evidence water penetration.
   a. Test Area: A minimum area of 75 feet (23 m) by one story of glazed aluminum curtain wall.

3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 44 13
SECTION 08 44 23–STEEL FIRE RATED GLAZED CURTAINWALL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes:
   1. Interior fire-rated curtain wall system, including glazing, perimeter trims, accessories, shims and anchors, and perimeter sealing of curtain wall framing to be installed as a one-hour wall assembly.

B. Related Sections include the following:
   1. Division 7 Section "Fire-Resistive Joint Systems" for perimeter fire-containment systems (safing insulation) field installed with steel fire-rated glazed curtain-wall systems.
   2. Division 7 Section "Joint Sealants" for installation of joint sealants installed with steel fire-rated glazed curtain-wall systems and for sealants to the extent not specified in this Section.
   3. Division 8 Section “Door Hardware” for door hardware not provided in this Section.

1.5 PERFORMANCE REQUIREMENTS

A. General: Provide steel fire-rated glazed curtain-wall systems, including anchorage, capable of withstanding, without failure, the effects of the following:
   1. Structural loads.
2. Thermal movements.
3. Movements of supporting structure indicated on Drawings including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
4. Dimensional tolerances of building frame and other adjacent construction.
5. Failure includes the following:
   a. Deflection exceeding specified limits.
   b. Thermal stresses transferred to building structure.
   c. Framing members transferring stresses, including those caused by thermal and structural movements, to glazing.
   d. Noise or vibration created by wind and thermal and structural movements.
   e. Loosening or weakening of fasteners, attachments, and other components.
   f. Sealant failure.

B. System Description:
1. Steel fire-rated glazed curtain wall system, outside glazed pressure plate, cover cap format.
2. Face Width:
   a. 1 3/4-inch.

C. Structural Loads:
1. Seismic Loads: As indicated on structural drawings.

D. Duration of Fire Rating – Window/Walls: Capable of providing a fire rating for 120 minutes, or as noted in the Drawings.

E. Duration of Fire Rating – Doors: Capable of providing a fire rating for 90 minutes, as noted in the Door Schedule.

1.6 SUBMITTALS

A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, connections to adjacent construction, and finishes for each type of product indicated.

B. LEED Submittals:
1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
   a. Steel.
   b. Mineral fiber wool insulation.
2. Credit MR 5.1 and 5.2: Manufacturers certificate demonstrating that each material or product indicated was extracted, harvested or recovered, as well as manufactured within 500 miles of the project site.

C. Shop Drawings: Show doors, frames, hardware and steel frame components as shown on shop drawings and schedules
1. Prepared by or under the supervision of a qualified professional engineer detailing fabrication and assembly of steel fire-rated glazed curtain-wall systems.
2. Include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

D. Obtain Architect’s approval before fabrication.

E. Samples for Initial Color Selection:
1. Manufacturer's color charts showing the full range of colors available.

F. Samples: For following products:
1. Two 8-inch by 10-inch Samples for glass.
G. Glazing Schedule: Use same designations indicated on Drawings for glazed openings in preparing a schedule listing glass types and thicknesses for each size opening and location.

I. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

J. Pre-Installation Meeting: Conduct pre-installation meeting to verify project requirements, substrate conditions, manufacturer's installation instructions, and manufacturer's warranty requirements.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed glazing similar in material, design, and extent to that indicated for Project and whose work has resulted in construction with a record of successful in-service performance.

1. Engineering Responsibility: Preparation of data for glazed curtain-wall systems including the following:
   a. Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

B. Source Limitations for Glazing Accessories: Obtain glazing accessories from one source for each product and installation method indicated.

C. Fire-Rated Window Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by UL, for fire ratings indicated, based on testing according to NFPA 257, ASTM E119. Assemblies must be factory-welded or come complete with factory-installed mechanical joints and must not require job site fabrication.

D. Certification: Signed by manufacturers of glass and glazing products certifying that products furnished comply with requirements.

3. Underwriters Laboratories (UL) shall conduct fire test.

E. Listings and Labels - Fire Rated Assemblies: Under current follow-up service by an approved independent agency maintaining a current listing or certification. Label assemblies accordance with limits of manufacturer’s listing.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store and handle under provisions specified by manufacturer. (For details on storage and product handling, please contact Technical Glass Products and request information on storage and product handling.)

B. Deliver materials to specified destination in manufacturer or distributor’s packaging undamaged, complete with installation instructions.

C. Store off ground, under cover, protected from weather and construction activities.
1.9  PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of structural supports for steel fire-rated glazed curtain-wall systems by field measurements before fabrication and indicate measurements on Shop Drawings.

1.10  WARRANTY

A. Assembly Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of steel fire-rated glazed curtain-wall systems that do not comply with requirements or that deteriorate as defined in this Section within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including, but not limited to, excessive deflection.
      b. Noise or vibration caused by thermal movements.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
      d. Water leakage.
      e. Failure of operating components to function normally.
   2. Warranty Period - Pyrostop and Fire Frame: Five years from date of Substantial Completion.

B. Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.
   1. Warranty Period: 2 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1  MANUFACTURERS – FIRE RATED DOOR/WINDOW/WALL ASSEMBLY

A. Basis-of-Design Product: The design for each element of the assembly is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by another manufacturer which meets all of the requirements of this section.

B. Basis of Design for Glazing Material for Frame System: “Pyrostop®” fire-rated glazing as manufactured by the Pilkington Group and distributed by Technical Glass Products, 8107 Bracken Place SE, Snoqualmie, WA 98065 (800-426-0279) fax (800-451-9857) e-mail sales@fireglass.com, web site http://www.fireglass.com
   1. Laminated Glass with Intumescent Interlayers: Proprietary Category II safety glazing product in the form of multiple lites of Condition A (uncoated surfaces), Type I (transparent glass, flat), Class 1 (clear), Kind FT (fully tempered) float glass laminated with intumescent interlayers.

2.2 MATERIALS – GLASS

   1. Interior double glazing Pyrostop 120 to be installed in Curtainwall: 2-1/8” nominal thickness.

B. **Glazing Type 12 (GL 12)** - Fire Rated Glazing for Walls with Fritted Glass: ASTM C 1036 and ASTM C 1048; ‘Pyrostop’ Insulated glass unit composed of multiple sheets of Pilkington “Optiwhite” high visible light transmission glass laminated with an intumescent interlayer, a ¼” air space, and another layer of ¼” tempered glass with ceramic frit pattern on interior surface (within airspace).
   1. Interior double glazing Pyrostop 120 to be installed in Curtainwall: 1-9/16” nominal thickness + 8mm air space + ¼” fritted tempered glass = nom. 2-1/8”.

C. **Glazing Type 9 (GL 9)** - Fire Rated Glazing for Doors with Clear Glass: “Firelite Plus” IGU, 1” thick.

D. **Glazing Type 11 (GL 11)** - Fire Rated Glazing for Doors with Fritted Glass: “Firelite Plus” IGU, 1” thick, with ceramic frit pattern applied to the ¼” tempered outboard lite (within airspace).

E. Fritted Glass:
   1. Simulated acid etch coating: (Basis of Design) V1085 screen #3058, simulated acid etch, full coverage on interior surface (within airspace).
   2. One color of ceramic frit will be used in both Pyrostop and Firelite glazing.
   3. Aesthetic Effect: The simulated acid etch product listed establishes the standard (texture, density, translucence) which must be met by any other product to be considered an acceptable equal.

F. Approximate Visible Transmission before application of frit pattern: Varies with thickness (approximate range 75 to 88 percent).

G. Logo: Each piece of fire-rated glazing shall be labeled with a permanent logo including name of product, manufacture, testing laboratory (UL), fire rating period, safety glazing standards, and date of manufacture.

2.3 MATERIALS – STEEL FRAMING

A. Steel Curtainwall Framing System with 120 min. rating, as noted on the Drawings.
   1. Steel Frame: Profiled steel tubing permanently joined with steel bolts.
   2. Insulation: Insulate framing system against effects of fire, smoke, and heat transfer from either side. Insulate profiled steel tubing using a shell construction that incorporates Promatect-H intermediate interlayer. Firmly pack perimeter of framing system to rough opening with mineral wool fire stop insulation or appropriately rated intumescent sealant.
   3. Steel Glazing Beads: Extruded steel beads with dimensions recommended by manufacturer to securely hold glazing material in place.
   4. Fasteners: Type recommended by manufacturer
   5. Glazing Accessories: Set Pyrostop glass using calcium silicate, or setting blocks.
   6. Glazing Gaskets, Compounds and tapes: Glaze Pyrostop glass with approved EPDM glazing gaskets and closed cell PVC tape, or pure silicone sealant.

B. Steel Reinforcement: With manufacturer’s standard corrosion-resistant primer complying with SSPC-PS Guide No. 12.00 applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.
   1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
   2. Cold-Rolled Sheet and Strip: ASTM A 611.
   3. Hot-Rolled Sheet and Strip: ASTM A 570/A 570M.
C. Brackets and Reinforcements: Manufacturer's standard high-strength materials with nonstaining, nonferrous shims for aligning system components.

D. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
   1. Where fasteners are subject to loosening or turn out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
   2. Reinforce members as required to receive fastener threads.
   3. At movement joints, use slip-joint linings, spacers, and sleeves of material and type recommended by manufacturer.

E. Anchors: Three-way adjustable anchors that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.
   1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A 123/A 123M or ASTM A 153/A 153M requirements.

F. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.

2.4 ACCESSORIES

A. Exposed Fasteners: Use fasteners fabricated from Type 304 or Type 316 stainless steel.

B. Glazing Gaskets:
   1. Interior Applications: Glaze Pyrostop glass with approved, or pure silicone sealant.

C. Intumescent Tape: As supplied by frame manufacturer.

D. Setting Blocks: Calcium silicate.

E. Perimeter Anchors: Steel or 316 Stainless steel when exposed.

F. Flashings: As recommended by manufacturer; same material and finish as cover caps.

G. VOC Content of Interior Sealants: Provide sealants and sealant primers for use inside the weatherproofing system that comply with the following limits for VOC content when calculated according to 40 CFR 59, Part 59, Subpart D (EPA Method 24):
   1. Architectural Sealants: 250 g/L.
   2. Sealant Primers for Nonporous Substrates: 250 g/L.
   3. Sealant Primers for Porous Substrates: 775 g/L.

H. Silicone Sealant: One-Part Low Modulus, High Movement-Capable Sealant: Type S; Grade NS; Class 25 with additional movement capability of 100 percent in extension and 50 percent in compression (total 150 percent); Use (Exposure) NT; Uses (Substrates) M, G, A, and O as applicable. (Use-O joint substrates include: Metal factory-coated with a high-performance coating; galvanized steel; ceramic tile.)
   1. Available Products: Subject to compliance with requirements, provide one of the following:
     a. Dow Corning 790 - Dow Corning Corp.

I. Intumescent Caulk: Single component, latex-based, intumescent caulk designed to stop passage of fire, smoke, and fumes through fire-rated separations; permanently flexible after cure; will not support mold growth; flame spread/smoke developed 10/10.
   1. Available Products: Subject to compliance with requirements, provide one of the following:
2.5 SLAG-WOOL-FIBER/ROCK-WOOL-FIBER INSULATION

A. Available Manufacturers:
   1. Fibrex Insulations Inc.
   2. Owens Corning.
   3. Thermafiber.

B. Unfaced, Slag-Wool-Fiber/Rock-Wool-Fiber Board Insulation: ASTM C 612, maximum flame-spread and smoke-developed indexes of 15 and 0, respectively; passing ASTM E 136 for combustion characteristics; and of the following nominal density and thermal resistivity:
   1. Nominal density of 4 lb/cu. ft. (64 kg/cu. m), Types IA and IB, thermal resistivity of 4 deg F x h x sq. ft./Btu x in. at 75 deg F (27.7 K x m/W at 24 deg C).
   2. Fiber Color: Regular color, unless otherwise indicated.

2.6 FABRICATION

A. General:
   1. Fabricate components per manufacturer's installation instructions and with minimum clearances and shim spacing around perimeter of assembly, yet enabling installation and dynamic movement of perimeter seal.
   2. Accurately fit and secure joints and corners. Make joints flush and weatherproof.
   3. Prepare components to receive anchor devices.
   4. Fabricate anchors.
   5. Arrange fasteners and attachments to be concealed from view.

2.7 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish doors, frames and curtain wall after assembly.

C. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.8 INTERIOR STEEL FINISHES

A. Color-Coated Finish: Apply manufacturer's standard powder coating finish system applied to factory-assembled frames before shipping, complying with manufacturer's written instructions for surface preparation including pretreatment, application, and minimum dry film thickness.
   2. Two colors will be required.
   3. Solid and metallic colors will be required.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Site Verification of Conditions: Verify substrate conditions (which have been previously installed under other sections) are acceptable for product installation in accordance with manufacturer's instructions. Verify openings are sized to receive curtain wall system and sill plate is level in accordance with manufacturer's acceptable tolerances.
   1. Field Measurements: Verify actual measurements/openings by field measurements before fabrication; show recorded measurements on shop drawings. Coordinate field measurements, fabrication schedule with construction progress to avoid construction delays.
B. Provide openings plumb, square and within allowable tolerances.

C. Notify Architect of any conditions which jeopardize the integrity of the proposed fire wall / door system. Do not proceed until such conditions are corrected.

3.2 INSTALLATION

A. General: Install curtain wall systems plumb, level, and true to line, without warp or rack of frames with manufacturer’s prescribed tolerances and installation instructions. Provide support and anchor in place.

B. Install fire curtain wall by a specialty contractor with appropriate experience qualifications; and in strict accordance with the approved shop drawings. Employ experienced mechanics familiar with this type of specialized work.

C. Glazing: Glass shall be outside glazed and held in place with stainless steel pressure plates anchored to the mullion using stainless steel fasteners spaced no greater than 12-inches on center.

D. Install glazing in strict accordance with fire resistant glazing material manufacturer’s specifications. Field cutting or tampering is not permissible.

E. Firmly pack perimeter of framing system to rough opening with mineral wool fire stop insulation or appropriately rated intumescent sealant.

3.3 PROTECTION AND CLEANING

A. Protect glass from damage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels, and clean surfaces.

B. Protect glass from contact with contaminating substances resulting from construction operations, including weld splatter. If, despite such protection, contaminating substances do come into contact with glass, remove them immediately as recommended by glass manufacturer.

C. Remove and replace glass that is broken, chipped, cracked, abraded, or damaged in any way, including natural causes, accidents, and vandalism, during construction period.

D. Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Completion. Wash glass as recommended by glass manufacturer.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.
D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 44 23
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 08 44 33 - SLOPED GLAZING ASSEMBLIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Low-slope glazing assembly.

B. Related Sections:
   1. Division 05 Section "Structural Steel Framing" for steel framing that supports sloped glazing framing members.
   2. Division 07 Section "Joint Sealants" for installation of joint sealants installed with sloped glazing assemblies.
   3. Division 08 Section "Glazing" for requirements for glazing sloped glazing assemblies.

1.3 ALLOWANCES

A. Provide field quality control as part of testing and inspecting allowance.

1.4 PERFORMANCE REQUIREMENTS

A. General Performance: Sloped glazing assemblies shall withstand movements of supporting structure (where applicable) without failure due to defective manufacture, fabrication, installation, or other defects in construction.
   1. Sloped Glazing Assemblies: Comply with performance requirements specified, as determined by testing manufacturer's standard assemblies representing those indicated for this Project.
   2. Failures also include, but are not limited to, the following:
      a. Thermal stresses transferring to building structure.
      b. Glass breakage.
      c. Noise or vibration created by wind and thermal and structural movements.
      d. Loosening or weakening of fasteners, attachments, and other components.
      e. Failure of operating units.

B. Delegated Design: Design sloped glazing assemblies, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Structural Performance: Sloped glazing assemblies shall withstand the wind loads, the effects of gravity loads, and loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.
   1. Wind Loads: As indicated on Drawings.
      a. Basic Wind Speed: As indicated on Drawings.
      b. Importance Factor: As indicated on Drawings.
      c. Exposure Category: As indicated on Drawings.
   2. Snow Loads: As indicated on Drawings.
   3. Concentrated Live Loads: As indicated on Drawings, applied to framing members at locations that will produce greatest stress or deflection.
   4. Uniform Live Loads: As indicated on Drawings.
5. Load Combinations: Calculate according to requirements of applicable code indicated on Drawings.

D. Structural Performance: Provide sloped glazing assemblies tested according to ASTM E 330, as follows:
   1. When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
   2. When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main framing members exceeding 0.2 percent of span.
   3. Test Durations: As required by design wind velocity, but not less than 10 seconds.

E. Deflection of Framing Members: At design wind pressure, as follows:
   1. Deflection Normal to Glazing Plane: Limited to edge of glass in a direction perpendicular to glass plane not exceeding L/175 of the glass edge length for each individual glazing lite or an amount that restricts edge deflection of individual glazing lites to 3/4 inch (19.1 mm), whichever is less.
   2. Deflection Parallel to Glazing Plane: Limited to amount not exceeding that which reduces glazing bite to less than 75 percent of design dimension and that which reduces edge clearance between framing members and glazing or other fixed components to less than 1/8 inch (3.2 mm).

F. Flexural Members: Design for lateral bracing of compression flanges by cross members with minimum depth equal to 50 percent of braced flexural member. Glazing does not provide lateral support.

G. Seismic Performance: Sloped glazing assemblies shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
   1. Component Importance Factor is 1.25.

H. Water Penetration under Static Pressure: No evidence of water penetration through fixed glazing and framing areas when tested according to ASTM E 331 at a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft. (300 Pa).

I. Water Penetration under Dynamic Pressure: No evidence of water penetration through fixed glazing and framing areas when tested according to AAMA 501.1 at dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 25 lbf/sq. ft.
   1. Maximum Water Leakage: According to AAMA 501.1 No uncontrolled water penetrating assemblies or water appearing on assemblies' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters that is drained to exterior.

J. Thermal Movements: Allow for thermal movements from the following maximum change (range) in ambient and surface temperature:
   1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
   2. Test Interior Ambient-Air Temperature: 75 deg F (24 deg C).
   3. Performance: No buckling, stress on glass, sealant failure, or excess stress on framing, anchors, and fasteners and no reduction of performance when tested according to AAMA 501.5.

K. Energy Performance: Sloped glazing assemblies shall have certified and labeled energy-performance ratings according to the NFRC.
   1. Thermal Transmittance (U-Factor): Fixed glazing and framing areas shall have U-factor of not more than 0.4 Btu/sq. ft. x h x deg F (2.55 W/sq. m x K) as determined according to NFRC 100.
   2. Solar Heat-Gain Coefficient: Refer to Division 08 Section ‘Glazing’ for SHGC requirements.
3. Air Infiltration: Maximum air leakage through fixed glazing and framing areas of 0.30 cfm/sq. ft. (1.50 L/s per sq. m) of fixed area as determined according to ASTM E 283 at a minimum static-air-pressure differential of 1.57 lbf/sq. ft. (75 Pa).
4. Condensation Resistance: Fixed glazing and framing areas shall have an AAMA-certified CRF rating of not less than 60 @ 20% RH as determined according to AAMA 1502.7.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. LEED Submittals:
1. Product Data for Credit IEQ 4.1: For glazing sealants used inside the weatherproofing system, documentation including printed statement of VOC content.

C. Shop Drawings: For sloped glazing assemblies. Include plans, elevations, sections, details, and attachments to other work.
1. Include details of provisions for assembly expansion and contraction and for draining moisture within the assembly to the exterior.
2. Include full-size isometric details of each vertical-to-horizontal intersection of assembly, showing the following:
   a. Joinery including concealed welds.
   b. Anchorage.
   c. Expansion provisions.
   d. Glazing.
   e. Flashing and drainage.

D. Samples for Initial Selection: For units with factory-applied color finishes.

E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

F. Fabrication Sample: Of each framing intersection of assemblies, made from 12-inch (300-mm) lengths of full-size components and showing details of the following:
1. Joinery including concealed welds.
2. Anchorage.
5. Flashing and drainage.

G. Delegated-Design Submittal: For sloped glazing assemblies indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer and testing agency.

B. Seismic Qualification Certificates: For sloped glazing assemblies, accessories, and components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for sloped glazing assemblies.

D. Quality-Control Program: Developed specifically for Project, including fabrication and installation, according to recommendations in ASTM C 1401. Include periodic quality-control reports.
E. Source quality-control reports.

F. Field quality-control reports.

G. Warranties: Sample of special warranties.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
   1. The skylight assembly shall be completely erected by the manufacturer or under the manufacturer's direct supervision.

B. Testing Agency Qualifications: Qualified according to ASTM E 699 for testing indicated.

C. Design the skylight system using the “Step Down Principle” with the following characteristics:
   1. An interior (roomside) air seal at all component interfaces
   2. An exterior (weatherside) deterrent seal formed by continuous gaskets
   3. A glazing pocket vented to the exterior
   4. Extrusions with integral gutters of sufficient depth to carry all intruded rainwater/snowmelt to the exterior
   5. Condensation formed on the roomside surfaces shall be allowed to re-evaporate

D. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.
   1. Do not revise intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If revisions are proposed, submit comprehensive explanatory data to Architect for review.

E. NFRC Certification: Provide NFRC-certified and -labeled sloped glazing assemblies.

F. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build mockups of typical sloped glazing assembly area as directed by Architect.
   2. Field testing shall be performed on mockups according to requirements in "Field Quality Control" Article.
   3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

G. Preinstallation Conference: Conduct conference at Project site.

1.8 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of structural supports for sloped glazing assemblies by field measurements before fabrication.

1.9 WARRANTY

A. Special Assembly Warranty: Standard form in which manufacturer agrees to repair or replace components of sloped glazing assemblies that do not comply with requirements or that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including, but not limited to, excessive deflection.
      b. Noise or vibration created by wind and thermal and structural movements.
c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
d. Water penetration through fixed glazing and framing areas.
e. Failure of operating components.

2. Warranty Period: Five years from date of Substantial Completion.

B. Special Finish Warranty: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied finishes within specified warranty period.
1. Deterioration includes, but is not limited to, the following:
   a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
   b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
   c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide low-slope glazing assembly by Inter-Sky Skylight Specialties, or comparable product.

Inter-sky skylight specialties
1305 S. Lyon St., Santa Ana, CA 92705
Ph: 714.972.9112
Fax: 714.972.9113
Ph: 1.800.972.9112
E-Mail: info@inter-sky.com

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
4. Structural Profiles: ASTM B 308/B 308M.

B. Steel Reinforcement, if required: With manufacturer's standard, zinc-rich, corrosion-resistant primer, complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.
1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
2. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
3. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.3 FRAMING

A. Framing Members: Manufacturer's standard, formed- or extruded-aluminum framing members of thickness required and reinforced as required to support imposed loads.
1. Framing-Member Type: Self-supporting.
2. Glass Retention: Field-installed pressure caps on three sides.

B. Pressure Caps: Manufacturer's standard aluminum components that mechanically retain glazing.
1. Include snap-on aluminum trim that conceals fasteners.
C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning assembly components.

D. Fasteners and Accessories: Manufacturer’s standard, corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
   1. At pressure caps, use ASTM A 193/A 193M stainless-steel screws.
   2. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
   3. Reinforce members as required to receive fastener threads.
   4. Use exposed fasteners with countersunk Phillips screw heads, finished to match framing system, fabricated from Series 300 stainless steel.

E. Anchors: Three-way adjustable anchors, with minimum adjustment of 1 inch (25 mm), that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials, and recommended by manufacturer.
   1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with requirements in ASTM A 123/A 123M or ASTM A 153/A 153M.

F. Anchor Bolts: ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), galvanized steel.

G. Concealed Flashing: Manufacturer's standard, corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.

H. Exposed Flashing and Closures: Manufacturer's standard aluminum components not less than 0.040 inch (1.016 mm) thick.

I. Framing Sealants: Manufacturer's standard.

2.4 GLAZING

A. General: Comply with Division 08 Section "Glazing."

B. Glazing Gaskets: Dense EPDM Durometer 50 (shore A) per ASTM C-509. When structural silicone is used for capless glazing applications, use compatible gaskets recommended by the sealant manufacturer.

C. Glass Setting Blocks: Compatible with glass edge seals, with a durometer between 70 and 90 (shore A.)

D. Glazing Sealants: Silicone, as recommended by manufacturer.
   1. Sealants used inside the weatherproofing system shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
   2. Compatible with all substrates and develop full adhesive and cohesive strength when subjected to design loads/movements. Silicone shall be neutral cure, medium to high modulus.

2.5 ACCESSORY MATERIALS

A. Bituminous Paint: Cold-applied, asphalt-mastic paint complying with SSPC-Paint 33 requirements except containing no asbestos, formulated for 30-mil (0.76-mm) thickness per coat.

B. Cleaning Agent and Cloth: As recommended by structural-sealant manufacturer.

2.6 FABRICATION

A. Form or extrude aluminum shapes before finishing.
B. Fabricate components that, when assembled, have the following characteristics:
1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.
6. Components curved to indicated radii.
7. Internal guttering systems or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

C. Fabricate continuous, one-piece-type aluminum sill closures with weep holes.

D. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.7 ALUMINUM FINISHES

A. High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
2. Number of Colors: One.
3. Type of Color: Metallic.
4. Color must match one of the curtain wall colors.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:
1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure nonmovement joints.
5. Install anchors with separators and isolators to prevent metal corrosion, electrolytic deterioration, and impediments to movement of joints.
6. Weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
7. Seal joints watertight unless otherwise indicated.

B. Metal Protection:
1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.
3. Where aluminum will contact pressure-treated wood, separate dissimilar materials by method recommended by sloped glazing assembly manufacturer.

C. Install continuous sill closure with weatherproof expansion joints and locked and sealed or welded corners. Locate weep holes at rafters.

D. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the sloped glazing assembly to exterior.

E. Install components plumb and true in alignment with established lines and grades.

F. Install glazing as specified in Division 08 Section "Glazing."

3.3 ERECTION TOLERANCES

A. General: Install sloped glazing assemblies to comply with the following maximum tolerances:
1. Level: 1/8 inch in 20 feet (3 mm in 6 m); 1/4 inch in 40 feet (6 mm in 12 m).
2. Alignment: Limit offset from true alignment to 1/32 inch (0.8 mm) where surfaces abut in line, edge to edge, at corners, or where a reveal or protruding element separates aligned surfaces by less than 3 inches (76 mm); otherwise limit offset to 1/8 inch (3 mm).
3. Location and Plane: Limit variation from true location and plane to 1/8 inch in 12 feet (3 mm in 3.7 m); 1/2 inch (13 mm) over total length.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Services: Testing and inspecting of representative areas of sloped glazing assemblies shall take place as installation proceeds to determine compliance of installed assemblies with specified requirements.
1. Water Penetration: Areas shall be tested according to ASTM E 1105 at a minimum uniform and cyclic static-air-pressure difference of 0.67 times the static-air-pressure difference specified for laboratory testing in "Performance Requirements" Article, but not less than 6.24 lbf/sq. ft. (300 Pa), and shall not evidence water penetration.
   a. Test Area: Entire skylight
   b. Perform a minimum of two tests in areas as directed by Architect.
   c. Perform tests in each test area as directed by Architect. Perform tests prior to 70 percent completion.
2. Water-Spray Test: Before installation of interior finishes has begun, areas designated by Architect shall be tested according to AAMA 501.2 and shall not evidence water penetration.
   a. Test Area: Test entire skylight.

C. Sloped glazing assemblies will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.
C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated areas for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum
   2. Plastic Materials and Gaskets
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 44 33
SECTION 08 51 13 - ALUMINUM WINDOWS  [C]

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section includes:
   1. Fixed and operable aluminum windows for exterior locations.
   2. Mullion inserts to be installed in aluminum entrance doors and curtain wall transoms.

B. Related Requirements:
   1. Division 08 Section “Entrance Doors” for coordinating finish among aluminum fenestration units and for insertion of mullion units into entry doors.
   2. Division 08 Section “Glazed Aluminum Curtain Walls” for coordinating finish among aluminum fenestration units and for insertion of mullion units into transoms above entry doors.
   3. Division 08 Section “Glazing.”

1.3 PREINSTALLATION MEETINGS
A. Preinstallation Conference: Conduct conference at Project site.
   1. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
   2. Review and discuss the finishing of aluminum windows that is required to be coordinated with the finishing of other aluminum work for color and finish matching.
   3. Review, discuss, and coordinate the interrelationship of aluminum windows with other exterior wall components. Include provisions for anchorage, flashing, sealing perimeters, and protecting finishes.
   4. Review and discuss the sequence of work required to construct a watertight and weathertight exterior building envelope.
   5. Inspect and discuss the condition of substrate and other preparatory work performed by other trades.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, glazing and fabrication methods, dimensions of individual components and profiles, hardware, and finishes for aluminum windows.
B. Shop Drawings: Include plans, elevations, sections, hardware, accessories, insect screens, operational clearances, and details of installation, including anchor, flashing, and sealant installation. Include the following:
   1. Mullion details, including reinforcement and stiffeners.
   2. Joinery details.
   4. Flashing and drainage details.
   5. Weather-stripping details.
   7. Glazing details.
   8. Window cleaning provisions.

C. Samples for Initial Selection: For units with factory-applied color finishes.
   1. Include similar Samples of hardware and accessories involving color selection.

D. Samples for Verification: For aluminum windows and components required, showing full range of color variations for finishes, and prepared on Samples of size indicated below:
   1. Window Corner Fabrication: 12” x 12” long, full-size window corner including full-size sections of extrusions with factory-applied color finish, weather stripping, and glazing.
   2. Operable Window: Full-size unit with factory-applied finish to be included in mockup.
   3. Hardware: Full-size units with factory-applied finishes.

E. Product Schedule: For aluminum windows. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For manufacturer and Installer.

B. Product Test Reports: For each type of aluminum window, for tests performed by a qualified testing agency.

C. Sample Warranties: For manufacturer’s warranties.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer capable of fabricating aluminum windows that meet or exceed performance requirements indicated and of documenting this performance by test reports, and calculations.

B. Installer Qualifications: An installer acceptable to aluminum window manufacturer for installation of units required for this Project.

C. Product Options: Information on Drawings and in Specifications establishes requirements for aluminum windows’ aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.
D. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockup of typical wall area as indicated by Architect.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

E. Air Barrier System Preinstallation Conference: Participate in conference at Project Site. Requirements for conference are described in Division 07 Section "Fluid-Applied Air and Vapor Barriers.

1.7 PROJECT CONDITIONS
A. Field Measurements: Verify aluminum window openings by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating aluminum windows without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to established dimensions.

1.8 WARRANTY
A. Manufacturer's Warranty: Manufacturer agrees to repair or replace aluminum windows that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Failure to meet performance requirements.
   b. Structural failures including excessive deflection, water leakage, condensation, and air infiltration.
   c. Faulty operation of movable sash and hardware.
   d. Deterioration of materials and finishes beyond normal weathering.
   e. Failure of insulating glass.

2. Warranty Period:
   a. Window: 5 years from date of Substantial Completion.
   b. Glazing Units: 10 years from date of Substantial Completion.
   c. Aluminum Finish: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS
A. Basis-of-Design Product for Windows: Subject to compliance with requirements, provide Custom Window Series 8300-sq (Square) fixed, casement and awning windows, by Custom Window Company, or a comparable product by manufacturers including, but not limited to, one of the following:

1. Custom Window Company.
2. EFCO Corporation; a Pella company.
B. Basis-of-Design Product for Divided Light Mullion Insert: Subject to compliance with requirements, provide Custom Window Series 8600-sq (Square) fixed divided light mullion insert by Custom Window Company, or a comparable product by manufacturers including, but not limited to, one of the following:
1. Custom Window Company.
2. EFCO Corporation; a Pella company.

C. Source Limitations: Obtain aluminum windows from single source from single manufacturer.

2.2 WINDOW PERFORMANCE REQUIREMENTS

A. Product Standard: Comply with AAMA/WDMA/CSA 101/I.S.2/A440 for definitions and minimum standards of performance, materials, components, accessories, and fabrication unless more stringent requirements are indicated.

1. Window Certification: AMMA certified with label attached to each window.

B. Performance Class and Grade: AAMA/WDMA/CSA 101/I.S.2/A440 as follows:

1. Minimum Performance Class: AW.
2. Minimum Performance Grade: 100.

C. Air Infiltration Test
1. With window sash and ventilators closed and locked, test unit in accordance with ASTM E 283 at static air pressure of 6.24 psf.
2. Air infiltration shall not exceed .03 cfm per foot of perimeter crack length.

D. Water Resistance Test
1. With window sash and ventilators closed and locked, test unit in accordance with ASTM E 331 at static pressure difference of 12.00 psf.
2. There shall be no uncontrolled water leakage.

E. Uniform Load Deflection Test
1. With window sash and ventilators closed and locked, test unit in accordance with ASTM E 330 at a static air pressure difference (positive and negative) of 100 psf.
2. During the course of the test, no member shall deflect more than 1/175 of its span.

F. Uniform Load Structural Test
1. With window sash and ventilators closed and locked, test unit in accordance with ASTM E 330 at a static air pressure difference of 150 psf.
2. At conclusion of test there shall be no glass breakage, permanent damage to fasteners, hardware parts, support arms or actuating mechanisms, nor any other damage which would cause the window to be inoperable.

G. Thermal Transmittance: NFRC 100 maximum whole-window U-factor of 0.40 Btu/sq. ft. x h x deg F, when tested in accordance with AAMA 1503.1 with window sash and ventilators closed and locked.

H. Solar Heat-Gain Coefficient (SHGC): NFRC 200 maximum whole-window SHGC of 0.27. [C]
I. Condensation-Resistance Factor (CRF): Provide aluminum windows tested with window sash and ventilators closed and locked for thermal performance according to AAMA 1502.7, showing a CRF of less than 58.

J. Thermal Movements: Provide aluminum windows, including anchorage, that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change: 120 deg F, ambient; 180 deg F material surfaces.

2.3 ALUMINUM WINDOWS

A. Operating Types: Provide the following operating types in locations indicated on Drawings:

2. Fixed.

1. Thermally Improved Construction: Fabricate frames, sashes, and muntins with an integral, concealed, low-conductance thermal barrier located between exterior materials and window members exposed on interior side in a manner that eliminates direct metal-to-metal contact.
2. Extruded aluminum shall be 6063-T5 alloy and temper.
3. Aluminum frame and sash extrusion shall have a nominal wall thickness of .094”.
4. Depth of frame and sash combined shall not be less than 3 ½”.
5. True divided light muntins shall be a maximum of 1 1/16” wide, with profiles to match architectural drawings.

C. Glass and Insulating Glazing Units:

1. As specified in Section 8 Glazing.

D. Glazing System: Manufacturer’s standard factory-glazing system that produces weathertight seal.

E. Hardware, General: Provide manufacturer’s standard hardware fabricated from aluminum, stainless steel, carbon steel complying with AAMA 907, or other corrosion-resistant material compatible with adjacent materials; designed to smoothly operate, tightly close, and securely lock windows, and sized to accommodate sash weight and dimensions.

1. Exposed Hardware Color and Finish: As selected by Architect from manufacturer’s full range.

F. Window Hardware:

1. Gear-Type Rotary Operators: Complying with AAMA 901 when tested according to ASTM E 405, Method A. Provide operators that function without requiring the removal of interior screens or using screen wickets.
   a. Casement Ventilators:
1) Standard: Roto operators, casement locking handles and precision machined aluminum 5 knuckle butt hinges with nylon bushings and stainless steel pins.

2. Hinges: Non-friction type, not less than two per sash.

3. Limit Devices:
   a. Limit clear opening to 8 inches for ventilation; with custodial key release.

G. Weather Stripping: Provide full-perimeter weather stripping for each operable sash unless otherwise indicated. Weatherstrip to be Monsanto Santoprene or equal.

H. Fasteners: Noncorrosive and compatible with window members, trim, hardware, anchors, and other components.
   1. Exposed Fasteners: Do not use exposed fasteners to the greatest extent possible. For application of hardware, use fasteners that match finish hardware being fastened.

2.4 ACCESSORIES

A. Subsills: Thermally broken, extruded-aluminum subsills in configurations indicated on Drawings.

B. Interior Trim: Extruded-aluminum profiles in sizes and configurations indicated on Drawings.

C. Panning Trim: Extruded-aluminum profiles in sizes and configurations indicated on Drawings.

2.5 INSECT SCREENS

A. General: Fabricate insect screens to integrate with window frame. Provide screen for each operable exterior sash. Screen wickets are not permitted.
   1. Type and Location: Full, inside for project-out sashes.

B. Aluminum Frames: Manufacturer's standard aluminum alloy complying with SMA 1004 or SMA 1201. Fabricate frames with mitered or coped joints or corner extrusions, concealed fasteners, and removable PVC spline/anchor concealing edge of frame.
   1. Tubular Framing Sections and Cross Braces: Roll formed from aluminum sheet.

C. Aluminum Wire Fabric: 18-by-16 mesh of 0.011-inch- diameter, coated aluminum wire.
   1. Wire-Fabric Finish: Finish as selected from Manufacturer’s full range of standard and optional colors.

2.6 FABRICATION

A. Fabricate aluminum windows in sizes indicated. Include a complete system for assembling components and anchoring windows.

B. Glaze aluminum windows in the factory.
C. Weather strip each operable sash to provide weathertight installation.

D. Weep Holes: Provide weep holes and internal passages to conduct infiltrating water to exterior.

E. Provide water-shed members above side-hinged sashes and similar lines of natural water penetration.

F. Mullions: Provide mullions and cover plates, matching window units, complete with anchors for support to structure and installation of window units. Allow for erection tolerances and provide for movement of window units due to thermal expansion and building deflections, as indicated. Provide mullions and cover plates capable of withstanding design wind loads of window units.

G. Complete fabrication, assembly, finishing, hardware application, and other work in the factory to greatest extent possible. Disassemble components only as necessary for shipment and installation.

2.7 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.8 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

B. High-Performance Organic Finish (Three-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: conversion coating; Organic Coating: manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitve primer and fluoropolymer color topcoat containing not less than 50 percent polyvinylidene fluoride resin by weight). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions.

1. Color and Gloss: Match Architect's sample
2. Number of Colors: Two.
3. One color will match curtain wall.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine openings, substrates, structural support, anchorage, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Verify rough opening dimensions, levelness of sill plate, and operational clearances.

C. Examine wall flashings, vapor retarders, water and weather barriers, and other built-in components to ensure weathertight window installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's written instructions for installing windows, hardware, accessories, and other components. For installation procedures and requirements not addressed in manufacturer's written instructions, comply with installation requirements in ASTM E 2112.

B. Install windows level, plumb, square, true to line, without distortion or impeding thermal movement, anchored securely in place to structural support, and in proper relation to wall flashing and other adjacent construction to produce weathertight construction.

C. Install windows and components to drain condensation, water penetrating joints, and moisture migrating within windows to the exterior.

D. Separate aluminum and other corrodefible surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

3.3 ADJUSTING, CLEANING, AND PROTECTION

A. Adjust operating sashes and hardware for a tight fit at contact points and weather stripping for smooth operation and weathertight closure.

B. Clean exposed surfaces immediately after installing windows. Avoid damaging protective coatings and finishes. Remove excess sealants, glazing materials, dirt, and other substances.

1. Keep protective films and coverings in place until final cleaning.

C. Remove and replace glass that has been broken, chipped, cracked, abraded, or damaged during construction period.

D. Protect window surfaces from contact with contaminating substances resulting from construction operations. If contaminating substances do contact window surfaces, remove contaminants immediately according to manufacturer's written instructions.

3.4 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.
B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 51 13
PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Fire rated glass floor system.
      1. Rating: 60 minutes.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for metal-framed glass floor system.
   B. LEED Submittals:
      1. Product Data for Credit IEQ 4.1: For sealants used inside the weatherproofing system, documentation including printed statement of VOC content.
   C. Shop Drawings: For metal-framed glass floor systems. Include plans, elevations, sections, details, and attachments to other work.
      1. Include details of provisions for assembly expansion and contraction and for draining moisture within the assembly to the exterior.
      2. Include full-size isometric details of the following:
         a. Joinery including concealed welds.
         b. Anchorage.
         c. Expansion provisions.
         d. Glazing.
         e. Flashing and drainage.
   D. Samples for Initial Selection: For units with factory-applied color finishes.
   E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.
   F. Fabrication Sample: Of each framing intersection of assemblies, made from 12-inch (305-mm) lengths of full-size components and showing details of the following:
      1. Joinery including concealed welds.
      2. Anchorage.
      5. Flashing and drainage.
   G. Delegated-Design Submittal: For metal-framed glass floor system indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation. Engineer to be licensed in the Commonwealth of Pennsylvania.
1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer and Testing Agency.

B. Welding certificates.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for metal-framed glass floor system.

D. Field quality-control reports.

E. Warranties: Sample of special warranties.

F. Closeout Submittals: Provide manufacturer’s maintenance instructions that include recommendations for periodic cleaning and maintenance of all components.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with minimum documented experience of five completed projects in the past 10 years.

B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of metal-framed skylights required for this Project.

1. Installer to be company specializing in performing work of this section with minimum documented experience of five completed projects in the past 10 years, and approved by manufacturer.

C. Testing Agency Qualifications: Qualified according to ASTM E 699 for testing indicated.

D. Product Options: Information on Drawings and in Specifications establishes requirements for glass floor system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including testing conducted by an independent testing agency and in-service performance.

1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

E. Welding Qualifications: Qualify procedures and personnel according to AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

F. Provide a metal-framed glass floor system that complies with test-performance requirements indicated, as evidenced by reports of tests performed on manufacturer's standard assemblies by a qualified independent testing agency.

G. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

1. Build mockup of typical metal-framed glass floor system as directed by Architect.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

H. Preinstallation Conference: Conduct conference at Project site.
1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal-framed glass floor systems that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including, but not limited to, excessive deflection.
      b. Noise or vibration caused by thermal movements.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
      d. Adhesive or cohesive sealant failures.
      e. Water leakage.
   2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Lite Floor glass floor system by Greenlite Glass Systems Inc., other pre-approved comparable product.

Greenlite Glass Systems, Inc.
2495 Davies Avenue, Unit 55
Port Coquitlam, BC
Canada V3C 0B2
Ph: 778.285.8530
E-Mail: info@greenliteglass.com
Web: www.greenliteglass.com

2.2 PERFORMANCE REQUIREMENTS

A. General: Metal-framed skylights shall withstand the effects of the following without failure due to defective manufacture, fabrication, installation, or other defects in construction:
   1. Structural loads.
   2. Thermal movements.
   3. Movements of supporting structure.
   4. Dimensional tolerances of support system and other adjacent construction.
   5. Failure includes, but is not limited to, the following:
      a. Deflection exceeding specified limits.
      b. Thermal stresses transferring to building structure.
      c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.
      d. Glazing-to-glazing contact.
      e. Noise or vibration created by wind and by thermal and structural movements.
      f. Loosening or weakening of fasteners, attachments, and other components.
      g. Sealant failure.

B. Delegated Design: Design metal-framed skylights, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Structural Loads: Design glass floor system assemblies and attachments to resist the following loads:
   1. Floor Live and dead loads with L/500 of span maximum deflection.
      a. Live Loads: 100 psf (4.8 kPa) uniform load and concentrated load of 300 psf (14.4 kPa).
      b. Dead Loads: Actual weight of materials incorporated into Work.
2. Seismic Loads: As calculated in accordance with applicable code.

D. Thermal Movements: Provide metal-framed glass floor system that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures. Base engineering calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
1. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.3 METAL FRAMED GLASS FLOOR WINDOWS

A. System Description:
1. Steel support framing requires four sided steel support as primary and secondary support. Steel support is mild steel rolled hollow sections protected with intumescent paper and ceramic tape. Primed and painted with intumescent paint for fire rated systems.
2. Double Glazed Panel System: Glass panels are double glazed structural glass on the upper surface and fire resistant glass below for fire rated systems suitable for indoor or outdoor IGU system applications.
3. Glass floor systems combine the fire rated glass and structural glass into a single steel frame protected by intumescent paint.

B. Double Glazed Panel System: Double glazed indoor or outdoor IGU rated panels.
3. Panel Size: Glass panels up to:
   a. 1500 mm by 1500 mm
   b. 1000 mm by 2000 mm.
4. Structural Glass:
   a. Glass construction: Three layers of heat strengthened glass laminated together using two layers of 0.76 mm or 1.52 mm polyvinyl butyrate, as manufactured by Saint-Gobain Eckelt & Co or equivalent. Transparent, translucent, or colored interlayer options to be chosen by Architect from standard range.
   b. Insulated Glass Units with Galvanized Steel Spacer bars and Polyisobutylene sealant.
   c. Glass thickness: Nominally 33 mm thick comprising 3 by 10 mm heat strengthened sheets laminated together, or 1 by 6 mm heat strengthened top sheet glass with 2 by 12 mm lower sheets subject to final design parameters.
   d. Surface Finish: Slip-resistant Frit Top surface of uppermost sheet to have approximately 30 to 50 percent coverage, as determined by project and architectural requirements. Eckelt Litefloor anti-slip ceramic frit in standard pattern or slip-resistant acid-etched top surface Eckelt LITEFLOOR EXT range of patterned acid-etch glass. Slip resistance co-efficient will be determined in accordance with ASTM F 1679.
   e. Pattern & Color of Frit as selected by architect from full range of manufacturer’s standard and premium colors and patterns.
   f. Design Loading: As specified.
5. Fire-Resistant Glass: Contraflam as manufactured by Vetrotech Saint-Gobain North America, Auburn, WA 98001
   a. Rating: 60 minutes, thickness 20.76 mm.
6. Steel Support Beam Assembly: Liteflam Frame consists of the load transfer steel support system together with blah paper, intumescent paper and intumescent paint.
7. Assembly:
   a. Glass supported on steel frame shall deflect no more than L/500 under the specified loading. Minimum edge support for the glass panels is 20 to 30 mm.
   b. Sealant Seals between panel and edge to be constructed using two-part polysulphide sealant in standard color as specified in Section 07900.
   c. Bedding Strip: Bedding strip between glass and supporting steelwork to be 60 shore hardness continuous silicone strip in standard color. Minimum bedding thickness shall be 5 mm.
8. Test Certification: Fire performance of load-bearing glass floor/ceiling assembly has been tested in accordance with ASTM E 119, "Standard test methods for fire tests of building construction and materials".

2.4 FABRICATION

A. Fit and shop assemble in largest practical sections, for delivery to site and field bolted assembly.

B. Fabricate components with joints tightly fitted and secured.

C. Make exposed joints butt tight, flush, and hairline. Ease exposed edges to small uniform radius.

D. Supply components required for anchorage of fabrications. Fabricate anchors and related components of same material and finish as fabrication, except where specifically noted otherwise.

E. Prepare steel component surfaces in accordance with SSPC SP 6.

F. Shop prime and paint steel members. Do not prime surfaces that will be in contact with concrete, or high strength bolted.
   1. Finish paint with white Intumescent paint.
   2. Color top coat to be provided as selected by the Architect.

G. Supply steelwork to site with intumescent paint protection provided up to base coat level only. Final decorative finish coat to be applied on site after installation of steelwork is completed.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. Verify field measurements are as shown on shop drawings.

C. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install components plumb and level, accurately fitted, free from distortion or defects.

C. Allow for erection loads, and for sufficient temporary bracing to maintain platform safe, plumb, and in alignment until completion of erection and installation of permanent bracing.

D. Make field connections with threaded fasteners.

E. Install panels on frames with full bearing.
F. Do not field cut or alter structural members without approval of Architect and glass floor system manufacturer.

G. After erection, touch up abrasions to match shop finishes.

H. Field finish components as specified in Division 09 Section “Interior Painting.”

3.4 FIELD QUALITY CONTROL

A. Bolted Connections: Inspect in accordance with AISC specifications.
   1. Visually inspect all bolted connections.

B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
   1. Water-Spray Test: Before installation of interior finishes has begun, metal framed glass floor system shall be tested according to AAMA 501.2 and shall not evidence water penetration.

C. Repair or remove work where test results and inspections indicate that it does not comply with specified requirements.

D. Additional testing and inspecting, at Contractor’s expense, will be performed to determine compliance of replaced or additional work with specified requirements.

E. Prepare test and inspection reports.

3.5 PROTECTION

A. Protect installed products until completion of project.

B. Do not permit traffic over unprotected floor surface.

C. Touch-up, repair or replace damaged products before Substantial Completion.

3.6 WASTE MANAGEMENT

A. Minimize packaging required for material delivery without compromising protection of materials while either in transit to the project site or being stored on site.

B. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged during construction.
   1. Separate tempered glass waste for use as aggregate of nonstructural fill.

C. Separate waste (if any) in accordance with the Construction Waste Management Plan. Place in designated area for reuse or recycling. If recycling options are available locally or through manufacturer, recycle as a minimum, the following materials:
   1. Aluminum.
   2. Plastic Materials
   3. Corrugated cardboard packaging.

D. Preference is to be given to suppliers/installers who take back waste for reuse or recycling.

END OF SECTION 08 64 00
SECTION 08 71 00 - FINISH HARDWARE   [C]

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

1.2 DESCRIPTION OF WORK

A. Definition: "Finish Hardware" includes items known commercially as finish hardware which are required for swing, sliding and folding doors, except special types of unique and non-matching hardware specified in the same section as the door and door frame.

B. Extent of finish hardware required is indicated on drawings and in schedules.

C. Types of finish hardware required include the following:
   1. Butt Hinges
   2. Continuous Hinges
   3. Lock cylinders and keys
   4. Lock and latch sets
   5. Exit devices
   6. Closers
   7. Electronic door control devices
   8. Overhead Holders
   9. Door trim units

1.3 RELATED SECTIONS

A. Division 8 - Steel Doors and Frames.

B. Division 8 - Flush Wood Doors.

C. Division 8 - Aluminum Doors and Frames

D. Division 16 – Electrical

1.4 QUALITY ASSURANCE

A. Manufacturer: Obtain each type of hardware (latch and lock sets, etc.) from a single manufacturer.

B. Supplier: A recognized architectural finish hardware supplier, with warehousing facilities, who has been furnishing hardware in the project's vicinity for a period of not less than 2 years, and who is, or who employs an experienced architectural hardware consultant who is available, at reasonable times during the course of the work, for consultation about project's hardware requirements, to Owner, Architect and Contractor.

C. Where emergency exit devices are required on fire-rated doors (with supplementary marking on doors with labels indicating "Fire Door to be Equipped with Fire Exit Hardware") provide labels on exit devices indicating "Fire Exit Hardware"
D. This supplier shall be responsible to field check existing openings for proper application of sizes and strikes for all openings.

1.5 REGULATORY REQUIREMENTS

B. Fire-Rated Openings: Provide hardware for fire-rated openings in compliance with NFPA Standard No. 80 and local building code requirements. Provide only hardware which has been tested and listed by UL or an approved testing agency for types and sizes of doors required and complies with requirements of door and door frame labels.

C. Fire-Rated Assemblies: Upon completion of the installation, all fire door assemblies shall be tested to confirm proper operation of the closing device and that it meets all criteria of a fire door assembly as per NFPA 80 2007 Edition. At completion of the project, written record shall be furnished by the door hardware supplier and given to the owner to be made available to the Authority Having Jurisdiction, “AHJ”. The record shall show all fire rated openings, door number and location, along with hardware supplied and installed for the opening. The inspection of the fire doors that are swinging doors with builders hardware type to be performed by individuals with knowledge and understanding of the operating components of the type of door being subjected to testing as required by the AHJ.

1.6 SUBMITTALS

A. Product Data: Submit manufacturer’s technical product data for each item of hardware in accordance with Division-1 section "Submittals”. Include whatever information may be necessary to show compliance with requirements, and include instructions for installation and for maintenance of operating parts and finish.

B. Hardware Schedule: Submit final hardware schedule in a vertical format as recognized by the Door and Hardware Institute (DHI). Horizontal schedule format will not be accepted. Coordinate hardware with doors, frames and related work to ensure proper size, thickness, hand, function and finish of hardware.

   1. Final Hardware Schedule Content: Based on finish hardware indicated, organize hardware schedule into “hardware sets” indicating complete designations of every item required for each door or opening. Include the following information:

   a. Type, style, function, size and finish of each hardware item.

   b. Name and manufacturer of each item.

   c. Fastenings and other pertinent information.

   d. Index to include location of hardware set cross-referenced to indications on drawings both on floor plans and in door and frame schedule.

   e. Explanation of all abbreviations, symbols, codes, etc., contained in schedule.

   f. Mounting locations for hardware.

   g. Door and frame sizes and materials.

   h. Keying information.

   i. Wiring diagrams with theory of operation.

C. Submittal Sequence: Submit schedule in accordance to Division 1, particularly where acceptance of hardware schedule must precede fabrication of other work (e.g., hollow metal frames) which is critical in the project construction schedule. Include with schedule the product data, samples, shop drawings of other work affected by finish hardware, and other information essential to the coordinated review of hardware schedule.
D. Keying Schedule: Submit separate detailed schedule indicating clearly how the Owner’s final instructions on keying of locks has been fulfilled.

E. Samples if Requested: Prior to submittal of the final hardware schedule and prior to final ordering of finish hardware, submit one sample of each type of exposed hardware unit, finish as required, and tagged with full description for coordination with schedule.

F. Templates: Furnish hardware templates to each fabricator of doors, frames and other work to be factory-prepared for the installation of hardware. Upon request, check shop drawings of such other work, to confirm that adequate provisions are made for proper location and installation of hardware.

1.7 PRODUCT HANDLING

A. Tag each item or package separately, with identification related to final hardware schedule, and include basic installation instructions with each item or package.

B. Inventory hardware jointly with representatives of hardware supplier and hardware installer until each is satisfied that count is correct.

C. Deliver individually packaged hardware items at the proper times to the proper locations (shop or project site) for installation.

D. Provide secure lock-up for hardware delivered to the project, but not yet installed. Control handling and installation of hardware items which are not immediately replaceable, so that completion of the work will not be delayed by hardware losses, both before and after installation.

PART 2 - PRODUCTS

2.1 SCHEDULED HARDWARE

A. Requirements for design, grade, function, finish, size and other distinctive qualities of each type of finish hardware is indicated in the Finish Hardware Data Sheet and Hardware Schedule at the end of this section. Products are identified by using hardware designation numbers of the following.

B. Manufacturer’s Product Designations:
   Butt Hinges: Ives
   Continuous Hinges: Ives
   Locksets: Schlage Lock Co.
   Cylinders: Best Lock Co. (No Substitutions)
   Exit Devices: Von Duprin (No Substitutions)
   Closers: LCN Closers (No Substitutions)
   Automatic Door Operators LCN Closers (No Substitutions)
   Overhead Holders: Glynn-Johnson
   Kickplates: Ives
   Threshold & Weatherstrip National Guard Products

2.2 MATERIALS AND FABRICATION

A. General:
   1. Hand of door: Drawings show direction of slide, swing or hand of each door leaf. Furnish each item of hardware for proper installation and operation of door movement as shown.
2. Manufacturer's Name Plate: Do not use manufacturer's products which have manufacturer's name or trade name displayed in a visible location (omit removable nameplates), except in conjunction with required UL labels and as otherwise acceptable to Architect.

3. Manufacturer's identification will be permitted on rim of lock cylinders only.

4. Finish: All hardware finish shall match US26D unless otherwise indicated. Closer bodies, covers and arms shall be powder coated finish.

5. Lockset Design: Lever handle design shall be similar to “Danmark 615A” as manufactured by Schlage Lock Co.

6. Fasteners: Provide hardware manufactured to conform to published templates, generally prepared for machine screw installation. Do not provide hardware which has been prepared for self-tapping sheet metal screws, except as specifically indicated.
