

Coffee Mug for One-Fingered Individuals

I learnt a lot about the design process for this project. Our task was to create a coffee cup for one –fingered people. I learnt a lot about the classification tree and how to prioritize what the customer wants. This was an extremely useful information because I want to go into the designing part of engineering. We decided to go with a coffee cup that the customer would fit around his/her wrist. It looked a lot like a regular coffee cup so it would not bring attention to the owner which was something that we got from the classification tree.

It looked a lot like this but we would have multiple sized handles that would fit any size of wrist
