

Engineering Drawing

This semester I learnt a lot about the drawing aspect of Engineering. My class spent most of the semester learning how to draw and look at multi-view since this is the most common one.

I would look at figures in isometric view like this

And then convert them into multi-view figures like this

Obviously these are not the same figure. Learning how to do this is extremely helpful in a career in engineering because it allows me to view an object in multiple ways and see how things will fit together or not. We also learned how to go the other way and to go from multi-view to isometric. At the end of the semester my class got to some of the more complex views like section view. Section view allows use to view more complicate figures that that have a lot of

hidden features that the multi-view just could not handle. With the things I learned I will be able to be very successful in my future job in engineering.
