For the first project, our task was to create a mug that would be ideal for someone with only one finger to use. We worked as a group and my group made the following design because we figured it was the best mug for these types of people.

The design is easy for someone with one finger to hold, because they can put their hand through the middle and use their finger as support. It is not too heavy because we chose to make it out of a durable plastic material. Below is a chart we used in our concept selection.
