Throughout the semester, I have learned a great deal about different types of engineering drawing. Multi-view is a method where you take a 3D object and draw the top, front, and right view of the object. In an isometric view, you would draw a view that looks 3D (on paper still), using isometric paper to give the object a 3-dimensional view through drawing lines at 120 degree angles to create corners and multiple planes.

The following picture is an example of a multi-view drawing.
The following picture is an example of an isometric drawing.
