Creating a doll for my Cad project was something near to my heart. When I was a little girl, I would always play with Barbies. Barbies always looked the same. Therefore, when I chose to create a doll on solidworks, I made it very individualistic. The most difficult part of this project was creating a body that was fairly proportional. This was in regards to the lengths of the body parts. Also, creating a round head was also difficult, so I added a top hat to hide that fact. During this project I learned that there are multiple ways to create an object in Solidworks. In addition, your way may not be the best and learning from others guidance help immensely. This project was fun when I had the time to fiddle with Solidworks.
