

This semester I learned a lot about different kinds of drawing in engineering. I learned how to look at a 3D image and create multiple views from it. I also learned how to look at multiple views of an object and visualize a 3D object from it. Here are some examples. We also ran into issues often where the drawing was not scaled correctly to the grid paper that we were given. So at times I would have to create a ratio of actual measurements to units of the grid paper. This was very difficult at times but in the end I feel very confident in my design drawing skills
