When you have to get somewhere, one big question arises which is “HOW?” and the answer to that question is in my design. I have seen very few cars in recent decades come from the United States that are competitive on design with cars from Europe and Asia so being a student from India I thought of making a design which serves the day to day purpose of transportation as well as might be a commercial success.

My design is a symbol to show the world that there is no place you can’t get to. No matter for how long you are enclosed in the middle of 4 walls, once you decide to get somewhere there is always a thing which helps you get there. This is what happened with me while coming to Penn state. Being an international student I wasn’t exposed to the life I am living right now. After coming here I have realized that there is always an inspiration which drives you to the place you want. My design is that inspiration.

I believe that music connects people and hence I thought of designing speakers on top of this car. It shows that on the way to getting to the place you want to go to, you can connect to millions of different kinds of people which I am experiencing after coming here.

The most difficult part of this design was to build the speakers in such a way that it doesn’t look too tacky. Most of the cars have speakers inside, but this design has speakers inside and outside. I felt like going out of the box which according to me came out to be a good design.

While making this wonderful design I realized how solidworks can be so important in an engineer's life. Solidwords is the way an engineer can
express his ideas. It was really a great experience doing this project and I am quite happy with the outcome I have got.

The different views of my design:
